The NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA Scientific and Technical Information (STI) Program plays a key part in helping NASA maintain this important role.

The NASA STI Program provides access to the NASA STI Database, the largest collection of aeronautical and space science STI in the world. The Program is also NASA's institutional mechanism for disseminating the results of its research and development activities.

Specialized services that help round out the Program's diverse offerings include creating custom thesauri, translating material to or from 34 foreign languages, building customized databases, organizing and publishing research results ... even providing videos.

For more information about the NASA STI Program, you can:

- **Phone** the NASA Access Help Desk at (301) 621-0390
- **Fax** your question to the NASA Access Help Desk at (301) 621-0134
- **E-mail** your question via the **Internet** to help@sti.nasa.gov
- **Write** to:

Scientific and Technical Aerospace Reports

STAR

***Scientific and Technical Aerospace Reports* (*STAR*)**, is published each month as a major product of the International Aerospace Database, managed by the NASA Scientific and Technical Information (STI) Program.

Inside this issue you will find:

Front Matter
A typical citation and abstract sample explaining the standard format, which includes codes for ordering reports.

An Abstract Section
Citations and abstracts of reports and publications that provide comprehensive coverage of worldwide aerospace-related topics including aeronautics and space science technology. *STAR* lists published and publicly available reports entered into the NASA STI Database during the four weeks preceding publication of this issue. These citations and abstracts are listed by subject categories.

An Index Section
- Subject
- Personal author
- Corporate source
- Contract number
- Report number.

Appendix
A guide for ordering cited reports, registering with the NASA STI Program, and using the available products and services. Additionally, price schedules, phone numbers, and addresses are included in this information packed section.

NASA also sponsors companion journals, *International Aerospace Abstracts (IAA)*, and *NASA Open Volumes on Aerospace (NOVA)*. They list abstracts of the open literature on aerospace subjects available worldwide. IAA is available from the American Institute of Aeronautics and Astronautics (AIAA), and *NOVA* is for internal NASA use only, available from the NASA Center for AeroSpace Information (CASI).

Reports found in *STAR* are also available through the NASA online retrieval service, RECON, and the Aerospace Database through DIALOG.

The NASA STI Program gathers information through national and international agreements and exchanges and makes this information available to the NASA community and to the public in many forms through various outlets.

For additional information on the NASA STI Program, call the NASA Access Help Desk at (301) 621-0390, or write to:

TABLE OF CONTENTS

AERONAUTICS For related information see also *Astronautics.*

01 AERONAUTICS (GENERAL) 3227

02 AERODYNAMICS 3238
Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery. For related information see also *34 Fluid Mechanics and Heat Transfer.*

03 AIR TRANSPORTATION AND SAFETY 3243
Includes passenger and cargo air transport operations; and aircraft accidents. For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation.*

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 3245
Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control. For related information see also *17 Space Communications, Spacecraft Communications, Command and Tracking* and *32 Communications and Radar.*

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 3247
Includes aircraft simulation technology. For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics.* For land transportation vehicles see *85 Urban Technology and Transportation.*

06 AIRCRAFT INSTRUMENTATION 3250
Includes cockpit and cabin display devices; and flight instruments. For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography.*

07 AIRCRAFT PROPULSION AND POWER 3251
Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and onboard auxiliary power plants for aircraft. For related information see also *20 Spacecraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion.*

08 AIRCRAFT STABILITY AND CONTROL 3259
Includes aircraft handling qualities; piloting; flight controls; and autopilots. For related information see also *05 Aircraft Design, Testing and Performance.*

09 RESEARCH AND SUPPORT FACILITIES (AIR) 3260
Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tubes; and aircraft engine test stands. For related information see also *14 Ground Support Systems and Facilities (Space).*

ASTRONAUTICS For related information see also *Aeronautics.*

12 ASTRONAUTICS (GENERAL) 3262
For extraterrestrial exploration see *91 Lunar and Planetary Exploration.*

13 ASTRODYNAMICS 3269
Includes powered and free-flight trajectories; and orbital and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 3270
Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators. For related information see also *09 Research and Support Facilities (Air).*

15 LAUNCH VEHICLES AND SPACE VEHICLES 3270
Includes boosters; operating problems of launch/space vehicle systems; and reusable vehicles. For related information see also *20 Spacecraft Propulsion and Power.*

16 SPACE TRANSPORTATION 3271
Includes passenger and cargo space transportation, e.g., shuttle operations; and space rescue techniques. For related information see also *03 Air Transportation and Safety* and *18 Spacecraft Design, Testing and Performance.* For space suits see *54 Man/System Technology and Life Support.*

17 SPACE COMMUNICATIONS, SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING....3273
Includes telemetry; space communications networks; astronavigation and guidance; and radio blackout. For related information see also *04 Aircraft Communications and Navigation* and *32 Communications and Radar.*

N.A.—No abstracts were assigned to this category for this issue.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE **3274**
Includes satellites; space platforms; space stations; spacecraft systems and components such as thermal and environmental controls; and attitude controls. For life support systems see *54 Man/System Technology and Life Support.* For related information see also *05 Aircraft Design, Testing and Performance, 39 Structural Mechanics*, and *16 Space Transportation.*

19 SPACECRAFT INSTRUMENTATION **3285**
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography.*

20 SPACECRAFT PROPULSION AND POWER **3286**
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources. For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels, 44 Energy Production and Conversion*, and *15 Launch Vehicles and Space Vehicles.*

CHEMISTRY AND MATERIALS

23 CHEMISTRY AND MATERIALS (GENERAL) **3290**

24 COMPOSITE MATERIALS **3294**
Includes physical, chemical, and mechanical properties of laminates and other composite materials. For ceramic materials see *27 Nonmetallic Materials.*

25 INORGANIC AND PHYSICAL CHEMISTRY **3309**
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry. For related information see also *77 Thermodynamics and Statistical Physics.*

26 METALLIC MATERIALS **3320**
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS **3329**
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials. For composite materials see *24 Composite Materials.*

28 PROPELLANTS AND FUELS **3341**
Includes rocket propellants, igniters and oxidizers; their storage and handling procedures; and aircraft fuels. For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power*, and *44 Energy Production and Conversion.*

29 MATERIALS PROCESSING **3352**
Includes space-based development of products and processes for commercial application. For biological materials see *55 Space Biology:*

ENGINEERING For related information see also *Physics.*

31 ENGINEERING (GENERAL) **3353**
Includes vacuum technology; control engineering; display engineering; cryogenics; and fire prevention.

32 COMMUNICATIONS AND RADAR **3379**
Includes radar; land and global communications; communications theory; and optical communications. For related information see also *04 Aircraft Communications and Navigation* and *17 Space Communications, Spacecraft Communications, Command and Tracking.* For search and rescue see *03 Air Transportation and Safety*, and *16 Space Transportation.*

33 ELECTRONICS AND ELECTRICAL ENGINEERING **3404**
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry. For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics.*

34 FLUID MECHANICS AND HEAT TRANSFER **3415**
Includes boundary layers; hydrodynamics; fluidics; mass transfer and ablation cooling. For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics.*

35 INSTRUMENTATION AND PHOTOGRAPHY **3430**
Includes remote sensors; measuring instruments and gauges; detectors; cameras and photographic supplies; and holography. For aerial photography see *43 Earth Resources and Remote Sensing.* For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation.*

36 LASERS AND MASERS **3435**
Includes parametric amplifiers. For related information see also *76 Solid-State Physics.*

37 MECHANICAL ENGINEERING 3442
Includes auxiliary systems (nonpower); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 3449
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 3450
Includes structural element design and weight analysis; fatigue; and thermal stress. For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance.*

GEOSCIENCES For related information see also *Space Sciences.*

42 GEOSCIENCES (GENERAL) 3456

43 EARTH RESOURCES AND REMOTE SENSING 3456
Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography. For instrumentation see *35 Instrumentation and Photography.*

44 ENERGY PRODUCTION AND CONVERSION 3463
Includes specific energy conversion systems, e.g., fuel cells; global sources of energy; geophysical conversion; and windpower. For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *28 Propellants and Fuels.*

45 ENVIRONMENT POLLUTION 3467
Includes atmospheric, noise, thermal, and water pollution.

46 GEOPHYSICS 3475
Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism. For space radiation see *93 Space Radiation.*

47 METEOROLOGY AND CLIMATOLOGY 3480
Includes weather forecasting and modification.

48 OCEANOGRAPHY 3486
Includes biological, dynamic, and physical oceanography; and marine resources. For related information see also *43 Earth Resources and Remote Sensing.*

LIFE SCIENCES

51 LIFE SCIENCES (GENERAL) 3490

52 AEROSPACE MEDICINE 3492
Includes physiological factors; biological effects of radiation; and effects of weightlessness on man and animals.

53 BEHAVIORAL SCIENCES 3498
Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 3500
Includes human engineering; biotechnology; and space suits and protective clothing. For related information see also *16 Space Transportation.*

55 SPACE BIOLOGY 3509
Includes exobiology; planetary biology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) 3509

60 COMPUTER OPERATIONS AND HARDWARE 3520
Includes hardware for computer graphics, firmware, and data processing. For components see *33 Electronics and Electrical Engineering.*

61 COMPUTER PROGRAMMING AND SOFTWARE 3522
Includes computer programs, routines, algorithms, and specific applications, e.g., CAD/CAM.

62 COMPUTER SYSTEMS 3537
Includes computer networks and special application computer systems.

63 CYBERNETICS 3540
Includes feedback and control theory, artificial intelligence, robotics and expert systems. For related information see also *54 Man/System Technology and Life Support.*

64 NUMERICAL ANALYSIS 3546
Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 3552
Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 3556
Includes mathematical modeling; network analysis; and operations research.

67 THEORETICAL MATHEMATICS 3556
Includes topology and number theory.

PHYSICS For related information see also *Engineering.*

70 PHYSICS (GENERAL) 3560
For precision time and time interval (PTTI) see *35 Instrumentation and Photography*; for geophysics, astrophysics or solar physics see *46 Geophysics, 90 Astrophysics*, or *92 Solar Physics.*

71 ACOUSTICS 3561
Includes sound generation, transmission, and attenuation. For noise pollution see *45 Environment Pollution.*

72 ATOMIC AND MOLECULAR PHYSICS 3563
Includes atomic structure, electron properties, and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS 3573
Includes elementary and nuclear particles; and reactor theory. For space radiation see *93 Space Radiation.*

74 OPTICS 3577
Includes light phenomena and optical devices. For lasers see *36 Lasers and Masers.*

75 PLASMA PHYSICS 3583
Includes magnetohydrodynamics and plasma fusion. For ionospheric plasmas see *46 Geophysics.* For space plasmas see *90 Astrophysics.*

76 SOLID-STATE PHYSICS 3591
Includes superconductivity. For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers.*

77 THERMODYNAMICS AND STATISTICAL PHYSICS 3603
Includes quantum mechanics; theoretical physics; and Bose and Fermi statistics. For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer.*

SOCIAL SCIENCES

80 SOCIAL SCIENCES (GENERAL) 3608
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT 3609
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE 3611
Includes information management; information storage and retrieval technology; technical writing; graphic arts; and micrography. For computer documentation see *61 Computer Programming and Software.*

83 ECONOMICS AND COST ANALYSIS 3624
Includes cost effectiveness studies.

84 LAW, POLITICAL SCIENCE AND SPACE POLICY .... N.A.
Includes NASA appropriation hearings; aviation law; space law and policy; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION 3625
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation. For related information see *03 Air Transportation and Safety, 16 Space Transportation,* and *44 Energy Production and Conversion.*

SPACE SCIENCES For related information see also *Geosciences.*

88 SPACE SCIENCES (GENERAL) 3629

89 ASTRONOMY 3629
Includes radio, gamma-ray, and infrared astronomy; and astrometry.

90 ASTROPHYSICS 3632
Includes cosmology; celestial mechanics; space plasmas; and interstellar and interplanetary gases and dust. For related information see also *75 Plasma Physics.*

91 LUNAR AND PLANETARY EXPLORATION 3639
Includes planetology; and manned and unmanned flights. For spacecraft design or space stations see *18 Spacecraft Design, Testing and Performance.*

92 SOLAR PHYSICS 3652
Includes solar activity, solar flares, solar radiation and sunspots. For related information see also *93 Space Radiation.*

93 SPACE RADIATION 3653
Includes cosmic radiation; and inner and outer earth's radiation belts. For biological effects of radiation see *52 Aerospace Medicine.* For theory see *73 Nuclear and High-Energy Physics.*

GENERAL

Includes aeronautical, astronautical, and space science related histories, biographies, and pertinent reports too broad for categorization; histories or broad overviews of NASA programs.

The first part of the proposed research was a joint effort between our group and the Applied Physics Laboratory (APL), University of Washington. Our own research goal is to investigate the relation between the air-sea exchange processes and the sea state over the open ocean and to compare these findings with our previous results obtained over a small body of water namely, Lake Washington. The goals of the APL researchers are to study (1) the infrared sea surface temperature (SST) signature of breaking waves and surface slicks, and (2) microwave and acoustic scattering from water surface. The task of our group in this joint effort is to conduct measurements of surface fluxes (of momentum, sensible heat, and water vapor) and atmospheric radiation (longwave and shortwave) to achieve our research goal as well as to provide crucial complementary data for the APL studies. The progress of the project is summarized. Author

China's Aerodynamics Research and Development Center (hereafter called 'Center') is China's largest aerodynamics research and testing organ. It is located within Mianyang City in Sichuan Province. The Center is subordinate to the State Commission of Science, Technology, and Industry for National Defense. Its primary missions are to conduct experimental research, theoretical research, and applied research of aircraft and spacecraft and wind engineering; provide the results of their research to aircraft design organs and other state economic agencies; and to undertake the research and design of aerodynamic test equipment. The Advanced Design Program (ADP) is a unique program that brings together students and faculty from U.S. engineering schools with engineers from the NASA centers through integration of current and future NASA space and aeronautics projects into university engineering design curriculum. The Advanced Space Design Program study topics cover a broad range of projects that could be undertaken during a 20-30 year period beginning with the deployment of the Space Station Freedom. The Advanced Aeronautics Design Program study topics typically focus on nearer-term projects of interest to NASA, covering from small, slow-speed vehicles through large, supersonic passenger transports and on through hypersonic research vehicles. Student work accomplished during the 1990-91 academic year and reported at the 7th Annual Summer Conference is presented. For individual titles, see N93-29713 through N93-29761.

HIGH-ALTITUDE RECONNAISSANCE AIRCRAFT **c05**
Renee Anna Yazdi *In* Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 11-18 Previously announced in IAA as A91-54045 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

At the equator the ozone layer ranges from 65,000 to 130,000+ ft, which is beyond the capabilities of the ER-2, NASA's current high-altitude reconnaissance aircraft. This project is geared to designing an aircraft that can study the ozone layer. The aircraft must be able to satisfy four mission profiles. The first is a polar mission that ranges from Chile to the South Pole and back to Chile, a total range of 6000 n.m. at 100,000 ft with a 2500-lb payload. The second mission is also a polar mission with a decreased altitude and an increased payload. For the third mission, the aircraft will take off at NASA Ames, cruise at 100,000 ft, and land in Chile. The final mission requires the aircraft to make an excursion to 120,000 ft. All four missions require that a subsonic Mach number be maintained because of constraints imposed by the air sampling equipment. Three aircraft configurations were determined to be the most suitable for meeting the requirements. The performance of each is analyzed to investigate the feasibility of the mission requirements. Author (revised)

PROJECT SUMMARY **c05**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 19-28 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

California Polytechnic State University's design project for the 1990-91 school year was the design of a close air support aircraft. There were eight design groups that participated and were given requests for proposals. These proposals contained mission specifications, particular performance and payload requirements, as well as the main design drivers. The mission specifications called for a single pilot weighing 225 lb with equipment. The design mission profile consisted of the following: (1) warm-up, taxi, take off, and accelerate to cruise speed; (2) dash at sea level at 500 knots to a point 250 nmi from take off; (3) combat phase, requiring two combat passes at 450 knots that each consist of a 360 deg turn and an energy increase of 4000 ft. - at each pass, half of air-to-surface ordnance is released; (4) dash at sea level at 500 knots 250 nmi back to base; and (5) land with 20 min of reserve fuel. The request for proposal also specified the following performance requirements with 50 percent internal fuel and standard stores: (1) the aircraft must be able to accelerate from Mach 0.3 to 0.5 at sea level in less than 20 sec; (2) required turn rates are 4.5 sustained g at 450 knots at sea level; (3) the aircraft must have a reattack time of 25 sec or less (reattack time was defined as the time between the first and second weapon drops); (4) the aircraft is allowed a maximum take off and landing ground roll of 2000 ft. The payload requirements were 20 Mk 82 general-purpose free-fall bombs and racks; 1 GAU-8A 30-mm cannon with 1350 rounds; and 2 AIM-9L Sidewinder missiles and racks. The main design drivers expressed in the request for proposal were that the aircraft should be survivable and maintainable. It must be able to operate in remote areas with little or no maintenance. Simplicity was considered the most important factor in achieving the former goal. In addition, the aircraft must be low cost both in acquisition and operation. The summaries of the aircraft configurations developed by the eight groups are presented. Author (revised)

N93-29715*# California State Univ., Northridge.
PROJECT ARES 2: HIGH-ALTITUDE BATTERY-POWERED AIRCRAFT **c05**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 29-33 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

A high-altitude, battery-powered, propeller-driven aircraft was designed and is being built by undergraduate students at California State University, Northridge. The aircraft will fly at an altitude of 104,000 ft at Mach 0.2 (190 ft/sec) and will be instrumented to record flight performance data, including low Reynolds number propeller and airfoil information. This project will demonstrate the feasibility of electric-powered flight in a low-density, low-temperature Earth environment that models the atmosphere of Mars. Data collected will be used to design a Mars aircraft to investigate the surface of Mars prior to manned missions. The instrumented payload and the mission profile for the high-altitude Earth flight were determined. Detailed aerodynamic and structural analyses were performed. Control, tracking, and data recording subsystems were developed. Materials were obtained and fabrication begun. The aircraft has a 32-ft wing span, a wing area of 105 sq ft, is 17.5 ft long, has a 12-in payload bay, and weighs 42 lb. It is composed primarily of lightweight materials, including Mylar, and composite materials, including graphite/epoxy and aramid core honeycomb sandwich. Low-altitude flight testing to check guidance and control systems and to calibrate data-gathering instruments will take place this summer, followed shortly by the 104,000-ft flight. Author

CONCEPTUAL DESIGN OF A TWO-STAGE-TO-ORBIT VEHICLE c05
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 35-43 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

A conceptual design study of a two-stage-to-orbit vehicle is presented. Three configurations were initially investigated with one configuration selected for further development. The major objective was to place a 20,000-lb payload into a low Earth orbit using a two-stage vehicle. The first stage used air-breathing engines and employed a horizontal takeoff, while the second stage used rocket engines to achieve a 250-n.m. orbit. A two-stage-to-orbit vehicle seems a viable option for the next-generation space shuttle. Author

N93-29717*# Kansas Univ., Lawrence.
PRELIMINARY DESIGN STUDIES OF AN ADVANCED GENERAL AVIATION AIRCRAFT c05
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 45-56 (For primary document see N93-29712 11-01)
Avail: CASI HC A03/MF A03

Preliminary design studies are presented for an advanced general aviation aircraft. Advanced guidance and display concepts, laminar flow, smart structures, fuselage and wing structural design and manufacturing, and preliminary configuration design are discussed. This project was conducted as a graduate level design class under the auspices of the KU/NASA/USRA Advanced Design Program in Aeronautics. The results obtained during the fall semester of 1990 (Phase 1) and the spring semester of 1991 (Phase 2) are presented. Author (revised)

DESIGN STUDY TO SIMULATE THE DEVELOPMENT OF A COMMERCIAL TRANSPORTATION SYSTEM c05
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 57-64 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

Seven teams of senior-level Aerospace Engineering undergraduates were given a Request for Proposals (RFP) for a design concept of a remotely piloted vehicle (RPV). The RPV designs were intended to simulate commercial transport aircraft within the model of 'Aeroworld.' The Aeroworld model was developed so that the RPV designs would be subject to many of the engineering problems and tradeoffs that dominate real-world commercial air transport designs, such as profitability, fuel efficiency, range vs. payload capabilities, and ease of production and maintenance. As part of the proposal, each team was required to construct a prototype and validate its design with a flight demonstration. Author (revised)

THE DESIGN OF TWO-STAGE-TO-ORBIT VEHICLES c05
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 65-75 (For primary document see N93-29712 11-01)
Avail: CASI HC A03/MF A03

Two separate student design groups developed conceptual designs for a two-stage-to-orbit vehicle, with each design group consisting of a carrier team and an orbiter team. A two-stage-to-orbit system is considered in the event that single-stage-to-orbit is deemed not feasible in the foreseeable future; the two-stage system would also be used as a complement to an already existing heavy lift vehicle. The design specifications given are to lift a 10,000-lb payload 27 ft long by 10 ft diameter, to low Earth orbit (300 n.m.) using an air breathing carrier configuration that will take off horizontally within 15,000 ft. The staging Mach number and altitude were to be determined by the design groups. One group designed a delta wing/body carrier with the orbiter nested within the fuselage of the carrier, and the other group produced a blended cranked-delta wing/body carrier with the orbiter in the more conventional piggyback configuration. Each carrier used liquid hydrogen-fueled turbofanramjet engines, with data provided by General Electric Aircraft Engine Group. While one orbiter used a full-scale Space Shuttle Main Engine (SSME), the other orbiter employed a half-scale SSME coupled with scramjet engines, with data again provided by General Electric. The two groups conceptual designs, along with the technical trade-offs, difficulties, and details that surfaced during the design process are presented. Author (revised)

ASUR c05
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 77-81 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

The Ecole Polytechnique Feminine (EPF) is a French engineering school for women. The students who presented the project at the Summer Conference are in the fourth year of a five year program. For the second time, the EPF worked on an aeronautical project with the Ohio State University. This year, the theme was to design a hypersonic carrier aimed to launch an orbiter at Mach 6, a range of 375 miles and an altitude of 95,000 ft. The plane was called ASUR which in French means the blue sky, the same sky that links our countries across the ocean. Moreover, ASUR is an anagram of USRA. This work benefits from work on reusable hypersonic aircraft in Europe, and especially on two of them: STAR-H and Sanger. STAR-H is a French project. This hypersonic aircraft would replace Ariane 5 in launching a shuttle smaller than Hermes. Sanger is a German project. Its objective is to launch a manned shuttle called HORUS, but Ariane 5 would be kept for heavy cargo launches. These two projects are in competition in Europe to be a launcher of the European Space Agency. Author (revised)

DESIGN OF A TURBOFAN POWERED REGIONAL TRANSPORT AIRCRAFT c05
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 83-88 Previously announced as N92-20260 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

The majority of the market for small commercial transport aircraft is dominated by high-efficiency, propeller-driven aircraft of non-U.S. manufacture. During the past year senior student design teams at Purdue developed and then responded to a Request For Proposal (RFP) for a regional transport aircraft. The RFP development identified promising world markets and their needs. The students responded by designing aircraft with ranges of up to 1500 n.m. and passenger loads of 50 to 90. During the design project, special emphasis was placed upon keeping acquisition cost and direct operating costs at a low level while providing passengers with quality comfort levels. Twelve student teams worked for one semester developing their designs. Several of the more successful designs and those that placed a high premium on innovation are described. The depth of detail and analysis in these student efforts are also illustrated. Author (revised)

SOLAR POWERED MULTIPURPOSE REMOTELY POWERED AIRCRAFT **c05**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 89-94 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

Environmental problems such as the depletion of the ozone layer and air pollution demand a change in traditional means of propulsion that is sensitive to the ecology. Solar-powered propulsion is a favorable alternative that is both ecologically harmless as well as cost effective. Integration of solar energy into designs ranging from futuristic vehicles to heating is, therefore, beneficial to society. The design and construction of a Multipurpose Remotely Piloted Vehicle (MPRPV) seeks to verify the feasibility of using solar propulsion as a primary fuel source. This task has been a year-long effort by a group of eight students, divided into four teams, each dealing with different aspects of the design. The aircraft was designed to take off, climb to the design altitude, fly in a sustained figure-eight flight path, and cruise for approximately one hour. This mission requires flight at Reynolds numbers between 150,000 and 200,000 and demands special considerations in the aerodynamic design to achieve flight in this regime. Optimal performance requires a lightweight configuration with both structural integrity and maximum power availability. The structural design and choice of solar cells for the propulsion were governed by weight, efficiency, and cost considerations. The final design is an MPRPV weighing 35 N that cruises at 7 m/s at the design altitude of 50 m. The configuration includes a wing composed of balsa and foam NACA 6409 airfoil sections and carbon fiber spars, a tail of similar construction, and a truss structure fuselage. The propulsion system consists of 98 12.5 percent-efficient solar cells donated by Mobil Solar, a NiCad battery for energy storage, and a folding propeller regulated by a lightweight and efficient control system. The airfoils and propeller chosen for the design were researched and tested during the design process. Author (revised)

A HIGH-TEMPERATURE FURNACE FOR APPLICATIONS IN MICROGRAVITY **c14**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 97-104 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

Technology in the area of material processing and crystal growth has been greatly furthered by research in microgravity environments. The role of efficient, lightweight furnaces with reliable performance is crucial in these experiments. A need exists for the development of a readily duplicated, high-temperature furnace satisfying stringent weight, volume, and power constraints. A furnace was designed and is referred to as the UAH SHIELD. Stringent physical and operating characteristics for the system were specified, including a maximum weight of 20 kg, a maximum power requirement of 60 W, and a volume of the furnace assembly, excluding the batteries, limited to half a Get-Away-Special canister. The UAH SHIELD furnace uses radiation shield and vacuum technology applied in the form of a series of concentric cylinders enclosed on either end with disks. Thermal testing of a furnace prototype was performed in addition to some thermal and structural analysis. Results indicate the need for spacing of the shields to accommodate the thermal expansion during furnace operation. In addition, a power dissipation of approximately 100 W and system weight of approximately 30 kg was found for the current design. Author (revised)

ADVANCED DESIGN FOR ORBITAL DEBRIS REMOVAL IN SUPPORT OF SOLAR SYSTEM EXPLORATION **c18**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 105-111 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

The development of an Autonomous Space Processor for Orbital Debris (ASPOD) is the ultimate goal. The craft will process, in situ, orbital debris using resources available in low Earth orbit (LEO). The serious problem of orbital debris is briefly described and the nature of the large debris population is outlined. This year, focus was on development of a versatile robotic manipulator to augment an existing robotic arm; incorporation of remote operation of robotic arms; and formulation of optimal (time and energy) trajectory planning algorithms for coordinating robotic arms. The mechanical design of the new arm is described in detail. The versatile work envelope is explained showing the flexibility of the new design. Several telemetry communication systems are described which will enable the remote operation of the robotic arms. The trajectory planning algorithms are fully developed for both the time-optimal and energy-optimal problem. The optimal problem is solved using phase plane techniques while the energy optimal problem is solved using dynamics programming. Author

THE 1990/1991 PROJECT SUMMARIES **c12**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 113-116 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

Four projects carried out in 1990-9l at the University of California, Los Angeles, under NASA/USRA sponsorship are summarized. One of the projects described is a mission design, the three others include the design and construction of space-related hardware and testing. Topics researched include: manned voyage to Mars with periodic refueling from electrically propelled tankers; ground speed of balloons on Mars; tripod lunar landing structure; and grappling/docking device accommodating large lateral and angular misalignment. DESIGN, BUILDING, AND TESTING OF THE POSTLANDING SYSTEMS FOR THE ASSURED CREW RETURN VEHICLE **c16**
Kenneth C. Hosterman and Loren A. Anderson *In* Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 117-121 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

The design, building, and testing of the postlanding support systems for a water-landing Assured Crew Return Vehicle (ACRV) are presented. One ACRV will be permanently docked to Space Station Freedom, fulfilling NASA's commitment to Assured Crew Return Capability in the event of an accident or illness. The configuration of the ACRV is based on an Apollo Command Module (ACM) derivative. The 1990-1991 effort concentrated on the design, building, and testing of a one-fifth scale model of the egress and stabilization systems. The objective was to determine the feasibility of (1) stabilizing the ACM out of the range of motions that cause seasickness and (2) the safe and rapid removal of a sick or injured crew member from the ACRV. The development of the ACRV postlanding systems model was performed at the University of Central Florida with guidance from the Kennedy Space Center ACRV program managers. Emphasis was placed on four major areas. First was design and construction of a one-fifth scale model of the ACM derivative to accommodate the egress and stabilization systems for testing. Second was the identification of a water test facility suitable for testing the model in all possible configurations. Third was the construction of the rapid egress mechanism designed in the previous academic year for incorporation into the ACRV model. The fourth area was construction and motion response testing of the attitude ring and underwater parachute systems. Author

EARTH TO LUNAR CELSS EVOLUTION **c54**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 123-132 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

The comprehensive results of human activities on the environment, such as deforestation and ozone depletion, and the natural laws that govern the global environment have yet to be determined. Closed Ecological Life Support Systems (CELSS) research can play an instrumental role in dispelling these mysteries, as well as have the ability to support life in hostile environments, which the Earth one day may become. CELSS conclusions, such as the timescales in which plants fix carbon dioxide (CO2), will be the key to understanding each component and how it affects the ecological balance between plants and animals, the environment, and the biological engines that drive Earth's system. However, to understand how CELSS can be used as an investigative tool, the concept of a CELSS must be clearly defined. A definition of CELSS is given. The evolutionary establishment of a lunar base with a bioregenerative life support system in a Space Station Freedom (SSF) module to support a crew of four for two weeks duration was chosen as the design topic. DESIGN OF BIOMASS MANAGEMENT SYSTEMS AND COMPONENTS FOR CLOSED LOOP LIFE SUPPORT SYSTEMS **c54**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 133-137 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

The goal of the EGM 4000/1 Design class was to investigate a Biomass Management System (BMS) and design, fabricate, and test components for biomass management in a closed-loop life support system (CLLSS). The designs explored were to contribute to the development of NASA's Controlled Ecological Life Support System (CELSS) at Kennedy Space Center. Designs included a sectored plant growth unit, a container and transfer mechanism, and an air curtain system for fugitive particle control. The work performed by the class members is summarized. LUNAR LANDER GROUND SUPPORT SYSTEM **c14**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 139-142 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

This year's project, like the previous Aerospace Group's project, involves a lunar transportation system. The basic time line will be the years 2010-2030 and will be referred to as a second generation system, as lunar bases would be present. The project design completed this year is referred to as the Lunar Lander Ground Support System (LLGSS). The area chosen for analysis encompasses a great number of vehicles and personnel. The design of certain elements of the overall lunar mission are complete projects in themselves. For this reason the project chosen for the Senior Aerospace Design is the design of specific servicing vehicles and additions or modifications to existing vehicles for the area of concern involving servicing and maintenance of the lunar lander while on the surface. EXERCISE/RECREATION FACILITY FOR A LUNAR OR MARS ANALOG **c54**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 155-158 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

The University of Idaho, NASA/USRA project for the 1990-91 school year is an exercise/recreation station for an Earth-based simulator of a lunar or martian habitat. Specifically, a stationary bicycle that will help people keep fit and prevent muscular atrophy while stationed in space was designed. To help with motivation and provide an element of recreation during the workout, the bicycle is to be enhanced by a virtual reality system. The system simulates various riding situations, including the choice of a mountain bike or a road bike. The bike employs a magnetic brake that provides continuously changing tension to simulate actual riding conditions. This braking system is interfaced directly with the virtual reality system. Also, integrated into the virtual reality display will be a monitoring system that regulates heart rate, work rate, and other functions during the course of the session. Author

AUTOMATION OF CLOSED ENVIRONMENTS IN SPACE FOR HUMAN COMFORT AND SAFETY **c54**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 159-163 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

The development of Environmental Control and Life Support Systems (ECLSS) for Space Station Freedom, future colonization of the Moon, and Mars missions presents new challenges for present technologies. ECLSS that operate during long-duration missions must be semi-autonomous to allow crew members environmental control without constant supervision. A control system for the ECLSS must address these issues as well as being reliable. The Kansas State University Advanced Design Team is in the process of researching and designing controls for the automation of the ECLSS for Space Station Freedom and beyond. The ECLSS for Freedom is composed of six subsystems. The temperature and humidity control (THC) subsystem maintains the cabin temperature and humidity at a comfortable level. The atmosphere control and supply (ACS) subsystem insures proper cabin pressure and partial pressures of oxygen and nitrogen. To protect the space station from fire damage, the fire detection and suppression (FDS) subsystem provides fire-sensing alarms and extinguishers. The waste management (WM) subsystem compacts solid wastes for return to Earth, and collects urine for water recovery. The atmosphere revitalization (AR) subsystem removes CO2 and other dangerous contaminants from the air. The water recovery and management (WRM) subsystem collects and filters condensate from the cabin to replenish potable water supplies, and processes urine and other waste waters to replenish hygiene water supplies. These subsystems are not fully automated at this time. Furthermore, the control of these subsystems is not presently integrated; they are largely independent of one another. A fully integrated and automated ECLSS would increase astronauts' productivity and contribute to their safety and comfort. Author

DELTA ADVANCED REUSABLE TRANSPORT (DART): AN ALTERNATIVE MANNED SPACECRAFT c18
T. Lewerenz, M. Kosha, and H. Magazu *In* Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 165-175 (For primary document see N93-29712 11-01)
Avail: CASI HC A03/MF A03

Although the current U.S. Space Transportation System (STS) has proven successful in many applications, the truth remains that the space shuttle is not as reliable or economical as was once hoped. In fact, the Augustine Commission on the future of the U.S. Space Program has recommended that the space shuttle only be used on missions directly requiring human capabilities on-orbit and that the shuttle program should eventually be phased out. This poses a great dilemma since the shuttle provides the only current or planned U.S. means for human access to space at the same time that NASA is building toward a permanent manned presence. As a possible solution to this dilemma, it is proposed that the U.S. begin development of an Alternative Manned Spacecraft (AMS). This spacecraft would not only provide follow-on capability for maintaining human space flight, but would also provide redundancy and enhanced capability in the near future. Design requirements for the AMS studied include: (1) capability of launching on one of the current or planned U.S. expendable launch vehicles (baseline McDonnell Douglas Delta II model 7920 expendable booster); (2) application to a wide variety of missions including autonomous operations, space station support, and access to orbits and inclinations beyond those of the space shuttle; (3) low enough costing to fly regularly in augmentation of space shuttle capabilities; (4) production surge capabilities to replace the shuttle if events require it; (5) intact abort capability in all flight regimes since the planned launch vehicles are not man-rated; (6) technology cut-off date of 1990; and (7) initial operational capability in 1995. In addition, the design of the AMS would take advantage of scientific advances made in the 20 years since the space shuttle was first conceived. These advances are in such technologies as composite materials, propulsion systems, avionics, and hypersonics. Author (revised)

N93-29736*# Maryland Univ., College Park.
TAURUS LIGHTWEIGHT MANNED SPACECRAFT EARTH ORBITING VEHICLE c18
M. Bosset *In* Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 177-186 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

The Taurus Lightweight Manned Spacecraft (LMS) was developed by students of the University of Maryland's Aerospace Engineering course in Space Vehicle Design. That course required students to design an Alternative Manned Spacecraft (AMS) to augment or replace the Space Transportation System and meet the following design requirements: (1) launch on the Taurus Booster being developed by Orbital Sciences Corporation; (2) 99.9 percent assured crew survival rate; (3) technology cutoff date of 1 Jan. 1991; (4) compatibility with current space administration infrastructure; and (5) first flight by May 1995. The Taurus LMS design meets the above requirements and represents an initial step toward larger and more complex spacecraft. The Taurus LMS has a very limited application when compared to the space shuttle, but it demonstrates that the U.S. can have a safe, reliable, and low-cost space system. The Taurus LMS is a short mission duration spacecraft designed to place one man into low Earth orbit (LEO). The driving factor for this design was the low payload carrying capabilities of the Taurus Booster - 1300 kg to a 300-km orbit. The Taurus LMS design is divided into six major design sections. The Human Factors section deals with the problems of life support and spacecraft cooling. The Propulsion section contains the Abort System, the Orbital Maneuvering System (OMS), the Reaction Control System (RCS), and Power Generation. The thermal protection systems and spacecraft structure are contained in the Structures section. The Avionics section includes Navigation, Attitude Determination, Data Processing, Communication systems, and Sensors. The Mission Analysis section was responsible for ground processing and spacecraft astrodynamics. The Systems Integration Section pulled the above sections together into one spacecraft, and addressed costing and reliability. Author (revised)

WALKING ROBOT: A DESIGN PROJECT FOR UNDERGRADUATE STUDENTS c37
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 187-190 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

The objective of the University of Maryland walking robot project was to design, analyze, assemble, and test an intelligent, mobile, and terrain-adaptive system. The robot incorporates existing technologies in novel ways. The legs emulate the walking path of a human by an innovative modification of a crank-and-rocker mechanism. The body consists of two tripod frames connected by a turning mechanism. The two sets of three legs are mounted so as to allow the robot to walk with stability in its own footsteps. The computer uses a modular hardware design and distributed processing. Dual-port RAM is used to allow communication between a supervisory personal computer and seven microcontrollers. The microcontrollers provide low-level control for the motors and relieve the processing burden on the PC. Author

PROJECT MEDSAT c18
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 197-203 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

During the winter term of 1991, two design courses at the University of Michigan worked on a joint project, MEDSAT. The two design teams consisted of the Atmospheric, Oceanic, and Spacite System Design and Aerospace Engineering 483 (Aero 483) Aerospace System Design. In collaboration, they worked to produce MEDSAT, a satellite and scientific payload whose purpose was to monitor environmental conditions over Chiapas, Mexico. Information gained from the sensing, combined with regional data, would be used to determine the potential for malaria occurrence in that area. The responsibilities of AOSS 605 consisted of determining the remote sensing techniques, the data processing, and the method to translate the information into a usable output. Aero 483 developed the satellite configuration and the subsystems required for the satellite to accomplish its task. The MEDSAT project is an outgrowth of work already being accomplished by NASA's Biospheric and Disease Monitoring Program and Ames Research Center. NASA's work has been to develop remote sensing techniques to determine the abundance of disease carriers and now this project will place the techniques aboard a satellite. MEDSAT will be unique in its use of both a Synthetic Aperture Radar and visual/IR sensor to obtain comprehensive monitoring of the site. In order to create a highly feasible system, low cost was a high priority. To obtain this goal, a light satellite configuration launched by the Pegasus launch vehicle was used. Author (revised)

PROJECT UM-HAUL: A SELF-UNLOADING REUSABLE LUNAR LANDER **c18**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 205-211 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

The establishment of a lunar base is technologically and financially challenging. Given the necessary resources and political support, it can be done. In addition to the geopolitical obstacles, however, there are logistical problems involved in establishing such bases that can only be overcome with the acquisition of a significant transportation and communications network in the Earth-Moon spatial region. Considering the significant number of payloads that will be required in this process, the mass-specific cost of launching these payloads, and the added risk and cost of human presence in space, it is clearly desirable to automate major parts of such an operation. One very costly and time-consuming factor in this picture is the delivery of payloads to the Moon. Foreseeable payloads would include atmospheric modules, inflatable habitat kits, energy and oxygen plant elements, ground vehicles, laboratory modules, crew supplies, etc. The duration of high-risk human presence on the Moon could be greatly reduced if all such payloads were delivered to the prospective base site in advance of crew arrival. In this view, the idea of a 'Self-Unloading Reusable Lunar Lander' (SURLL) arises naturally. The general scenario depicts the lander being brought to low lunar orbit (LLO) from Earth atop a generic Orbital Transfer Vehicle (OTV). From LLO, the lander shuttles payloads down to the lunar surface, where, by means of some resident, detachable unloading device, it deploys the payloads and returns to orbit. The general goal is for the system to perform with maximum payload capability, automation, and reliability, while also minimizing environmental hazards, servicing needs, and mission costs. Our response to this demand is UM-HAUL, or the UnManned Heavy pAyload Unloader and Lander. The complete study includes a system description, along with a preliminary cost analysis and a design status assessment.

MULTIPURPOSE SATELLITE BUS (MPS) **c18**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 227-236 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

The Naval Postgraduate School Advanced Design Project sponsored by the Universities Space Research Association Advanced Design Program is a multipurpose satellite bus (MPS). The design was initiated from a Statement of Work (SOW) developed by the Defense Advanced Research Projects Agency (DARPA). The SOW called for a 'proposal to design a small, low-cost, lightweight, general purpose spacecraft bus capable of accommodating any of a variety of mission payloads. Typical payloads envisioned include those associated with meteorological, communication, surveillance and tracking, target location, and navigation mission areas.' The design project investigates two dissimilar missions, a meteorological payload and a communications payload, mated with a single spacecraft bus with minimal modifications. The MPS is designed for launch aboard the Pegasus Air Launched Vehicle (ALV) or the Taurus Standard Small Launch Vehicle (SSLV).

PROJECT WISH: THE EMERALD CITY **c18**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 237-240 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

Project WISH (Wandering Interplanetary Space Harbor) is a three-year design effort currently being conducted at The Ohio State University. Its goal is the design of a space oasis to be used in the exploration of the solar system during the midtwenty-first century. This spacecraft, named Emerald City, is to conduct and provide support for missions to other planetary bodies with the purpose of exploration, scientific study, and colonization. It is to sustain a crew of between 500 and 1000 people at a time, and be capable of traveling from a nominal orbit to the planets in reasonably short flight times. Such a ship obviously presents many technical and design challenges, some of which were examined through the course of Project WISH. This year, Phase 2 (1990-1991) of Project WISH was carried out. The basic design of the Emerald City resulting from Phase 1 (1989-1990) was taken and improved upon through more detailed analysis and revision. At the core of this year's study were orbital mechanics, propulsion, attitude control, and human factors. Throughout the year, these areas were examined and information was compiled on their technologies, performances, and relationships. Then, using the data obtained through these studies, two specific missions were designed: an envelope mission from a nominal orbit of 4 AU to Saturn and a single point design for a specific mission from the Earth to Mars. The latter was designed in view of the special interest that Mars is attracting for near-future space exploration. The mission to Saturn has all the first six planets within its flight envelope in less than or equal to a 3-year flight time at any time upon demand, and it has Uranus in its flight envelope most of the time upon demand. These mission studies provided data on the approximate size, weight, number of engines, and other important design values that would be required for the Emerald City.

FROM ORBITAL DEBRIS CAPTURE SYSTEMS THROUGH INTERNAL COMBUSTION ENGINES ON MARS **c12**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 241-248 (For primary document see N93-29712 11-01)
Avail: CASI HC A02/MF A03

The investigation and conceptualization of an orbital debris collector was the primary area of design. In addition, an alternate structural design for Space Station Freedom and systems supporting resource utilization at Mars and the moon were studied. Hardware for production of oxygen from simulate Mars atmosphere was modified to permit more reliable operation at low pressures (down to 10 mb). An internal combustion engine was altered to study how Mars atmosphere could be used as a diluent to control combustion temperatures and avoid excess Mars propellant production requirements that would result from either methane-rich or oxygen-rich, methane-oxygen combustion. An elastic loop traction system that could be used for lunar construction vehicles was refined to permit testing. A parabolic heat rejection radiator system was designed and built to determine whether it was capable of increasing heat rejection rates during lunar daytime operation. In addition, an alternate space station truss design, utilizing a pre-integrated concept, was studied and found to reduce estimate extravehicular activity (EVA) time and increase the structural integrity when compared to the original Warren truss concept. An orbital-debris-capturing spacecraft design which could be mated with the Orbital Maneuvering Vehicle was studied. The design identified Soviet C-1B boosters as the best targets of opportunity in Earth orbits between an altitude of 900 km and 1100 km and at an inclination of 82.9 deg. A dual robot pallet, which could be spun to match the tumbling rate of the C-1B booster, was developed as the conceptual design. Author (revised)

MARS SAMPLE RETURN MISSION: TWO ALTERNATE SCENARIOS **c66**

In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 249-252 (For primary document see N93-29712 11-01)

Avail: CASI HC A01/MF A03

Two scenarios for accomplishing a Mars Sample Return mission are presented. Mission A is a low-cost, low-mass scenario, while Mission B is a high-technology, high-science alternative. Mission A begins with the launch of one Titan 4 rocket with a Centaur G' upper stage. The Centaur performs the trans-Mars injection burn and is then released. The payload consists of two lander packages and the orbital transfer vehicle, which is responsible for supporting the landers during launch and interplanetary cruise. Near Mars, the landers separate - one bound for a polar site and the other for an equatorial site. After descending to the surface, the landers deploy small, local rovers to collect samples. The rovers return these samples to the landers for loading on the direct return rockets, which return the samples directly to the Earth's surface. Mission B starts with four Titan 4 launches, used to place the components of the planetary transfer vehicle (PTV) into orbit. The fourth launch payload is able to move to assemble the entire vehicle by simple docking routines. Once complete, the PTV begins a low-thrust trajectory out from low Earth orbit, through interplanetary space, and into low Mars orbit. It deploys a communications satellite into a one half sol orbit and then releases the lander pad cage at 500 km altitude. The lander package contains the lander, the Mars ascent vehicle (MAV), two lighter-than-air rovers (called Aereons), and one conventional land rover. The entire package is contained within a biconic aeroshell. After release from the PTV the lander package descends to the surface, where all three rovers are released to collect samples and map the terrain. The Aereons attempt to circumnavigate Mars and collect samples from a wide variety of sites, while the land rover examines a local area more thoroughly. The Aereons are equipped with small sample return rockets that can return their samples to the lander in the event that an Aereon is incapable of returning to the lander itself. Once all samples have been collected they are loaded onto the MAV and launched into orbit. The PTV then collects the samples and returns them to Earth orbit for recovery. Author (revised)

MARS HABITAT **c54**

In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 253-263 (For primary document see N93-29712 11-01)

Avail: CASI HC A03/MF A03

The College of Engineering & Architecture at Prairie View A&M University has been participating in the NASA/USRA Advanced Design Program since 1986. The interdisciplinary nature of the program allowed the involvement of students and faculty throughout the College of Engineering & Architecture for the last five years. The research goal for the 1990-1991 year is to design a human habitat on Mars that can be used as a permanent base for 20 crew members. The research is being conducted by undergraduate students from the Department of Architecture. Author

SELENIA: A HABITABILITY STUDY FOR THE DEVELOPMENT OF A THIRD GENERATION LUNAR BASE **c54**

In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 265-273 (For primary document see N93-29712 11-01)

Avail: CASI HC A02/MF A03

When Apollo astronauts landed on the Moon, the first generation of lunar bases was established. They consisted essentially of a lunar module and related hardware capable of housing two astronauts for not more than several days. Second generation lunar bases are being developed, and further infrastructure, such as space station, orbital transfer, and reusable lander vehicles will be necessary, as prolonged stay on the Moon is required for exploration, research, and construction for the establishment of a permanent human settlement there. Human life in these habitats could be sustained for months, dependent on a continual flow of life-support supplies from Earth. Third-generation lunar bases will come into being as self sufficiency of human settlements becomes feasible. Regeneration of water, oxygen production, and development of indigenous construction materials from lunar resources will be necessary. Greenhouses will grow food supplies in engineered biospheres. Assured protection from solar flares and cosmic radiation must be provided, as well as provision for survival under meteor showers, or the threat of meteorite impact. All these seem to be possible within the second decade of the next century. Thus, the builders of Selenia, the first of the third-generation lunar bases are born today. During the last two years students from the School of Architecture of the University of Puerto Rico have studied the problems that relate to habitability for prolonged stay in extraterrestrial space. An orbital personnel transport to Mars developed originally by the Aerospace Engineering Department of the University of Michigan was investigated and habitability criteria for evaluation of human space habitats were proposed. An important finding from that study was that the necessary rotational diameter of the vessel has to be on the order of two kilometers to ensure comfort for humans under the artificial gravity conditions necessary to maintain physiological well being of passengers, beyond the level of mere survival. THE LIGHTCRAFT PROJECT **c16**

Don G. Messitt and Leik N. Myrabo *In* Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 275-280 (For primary document see N93-29712 11-01)

Avail: CASI HC A02/MF A03

Rensselaer Polytechnic Institute has been developing a transatmospheric 'Lightcraft' technology which uses beamed laser energy to propel advanced shuttle craft to orbit. In the past several years, Rensselaer students have analyzed the unique combined-cycle Lightcraft engine, designed a small unmanned Lightcraft Technology Demonstrator, and conceptualized larger manned Lightcraft - to name just a few of the interrelated design projects. The 1990-91 class carried out preliminary and detailed design efforts for a one-person 'Mercury' Lightcraft, using computer-aided design and finite-element structural modeling techniques. In addition, they began construction of a 2.6 m-diameter, full-scale engineering prototype mockup. The mockup will be equipped with three robotic legs that 'kneel' for passenger entry and exit. More importantly, the articulated tripod gear is crucial for accurately pointing at, and tracking the laser relay mirrors, a maneuver that must be performed just prior to liftoff. Also accomplished were further design improvements on a 6-inch-diameter Lightcraft model (for testing in RPI's hypersonic tunnel), and new laser propulsion experiments. The resultant experimental data will be used to calibrate Computational Fluid Dynamic (CFD) codes and analytical laser propulsion models that can simulate vehicle/engine flight conditions along a transatmospheric boost trajectory. These efforts will enable the prediction of distributed aerodynamic and thruster loads over the entire full-scale spacecraft. Author (revised)

ASPEC: SOLAR POWER SATELLITE **c18**

In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced

Design Program 1991 p 281-285 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

The solar power satellite (SPS) will provide a clean, reliable source of energy for large-scale consumption. The system will use satellites in geostationary orbits around the Earth to capture the Sun's energy. The intercepted sunlight will be converted to laser beam energy that can be transmitted to the Earth's surface. Ground systems on the Earth will convert the transmissions from space into electric power. The preliminary design for the SPS consists of one satellite in orbit around the Earth transmitting energy to a single ground station. The SPS design uses multilayer solar cell technology arranged on a 20 km squared planar array to intercept sunlight and convert it to an electric voltage. Power conditioning devices then send the electricity to a laser, which transmits the power to the surface of the Earth. A ground station will convert the beam into electricity. Typically, a single SPS will supply 5 GW of power to the ground station. Due to the large mass of the SPS, about 41 million kg, construction in space is needed in order to keep the structural mass low. The orbit configuration for this design is to operate a single satellite in geosynchronous orbit (GEO). The GEO allows the system to be positioned above a single receiving station and remain in sunlight 99 percent of the time. Construction will take place in low Earth orbit (LEO); array sections, 20 in total, will be sailed on solar wind out to the GEO location in 150 days. These individual transportation sections are referred to as solar sailing array panels (SSAP's). The primary truss elements used to support the array are composed of composite tubular members in a pentahedral arrangement. Smart segments consisting of passive and active damping devices will increase the control of dynamic SPS modes. Author (revised)

SPACELY'S ROCKETS: PERSONNEL LAUNCH SYSTEM/FAMILY OF HEAVY LIFT LAUNCH VEHICLES **c15**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 291-293 (For primary document see N93-29712 11-01)
Avail: CASI HC A01/MF A03

During 1990, numerous questions were raised regarding the ability of the current shuttle orbiter to provide reliable, on demand support of the planned space station. Besides being plagued by reliability problems, the shuttle lacks the ability to launch some of the heavy payloads required for future space exploration, and is too expensive to operate as a mere passenger ferry to orbit. Therefore, additional launch systems are required to complement the shuttle in a more robust and capable Space Transportation System. In December 1990, the Report of the Advisory Committee on the Future of the U.S. Space Program, advised NASA of the risks of becoming too dependent on the space shuttle as an all-purpose vehicle. Furthermore, the committee felt that reducing the number of shuttle missions would prolong the life of the existing fleet. In their suggestions, the board members strongly advocated the establishment of a fleet of unmanned, heavy lift launch vehicles (HLLV's) to support the space station and other payload-intensive enterprises. Another committee recommendation was that a space station crew rotation/rescue vehicle be developed as an alternative to the shuttle, or as a contingency if the shuttle is not available. The committee emphasized that this vehicle be designed for use as a personnel carrier, not a cargo carrier. This recommendation was made to avoid building another version of the existing shuttle, which is not ideally suited as a passenger vehicle only. The objective of this project was to design both a Personnel Launch System (PLS) and a family of HLLV's that provide low cost and efficient operation in missions not suited for the shuttle. The future of the U.S. space program outlined by President Bush calls for a permanently manned lunar base. A payload delivery system will be required to support the buildup and operation of that lunar base. In response to this goal, RS Landers developed a conceptual design of a self-unloading, unmanned, reusable lunar lander. The lander will deliver a 7000-kg payload, with the same dimensions as a space station logistics module, from low lunar orbit (LLO) to any location on the surface of the Moon. Author

The debris problem has reached a stage at which the risk to satellites and spacecraft has become substantial in low Earth orbit (LEO). This research discovered that small particles posed little threat to spacecraft because shielding can effectively prevent these particles from damaging the spacecraft. The research also showed that, even though collision with a large piece of debris could destroy the spacecraft, the large pieces of debris pose little danger because they can be tracked and the spacecraft can be maneuvered away from these pieces. Additionally, there are many current designs to capture and remove large debris particles from the space environment. From this analysis, it was decided to concentrate on the removal of medium-sized orbital debris, that is, those pieces ranging from 1 cm to 50 cm in size. The current design incorporates a transfer vehicle and a netting vehicle to capture the medium-sized debris. The system is based near an operational space station located at 28.5 deg inclination and 400 km altitude. The system uses ground-based tracking to determine the location of a satellite breakup or debris cloud. These data are uploaded to the transfer vehicle, which proceeds to rendezvous with the debris at a lower altitude parking orbit. Next, the netting vehicle is deployed, tracks the targeted debris, and captures it. After expending the available nets, the netting vehicle returns to the transfer vehicle for a new netting module and continues to capture more debris in the target area. Once all the netting modules are expended, the transfer vehicle returns to the space station's orbit where it is resupplied with new netting modules from a space shuttle load. The new modules are launched by the shuttle from the ground and the expended modules are taken back to Earth for removal of the captured debris, refueling, and repacking of the nets. Once the netting modules are refurbished, they are taken back into orbit for reuse. In a typical mission, the system has the ability to capture 50 pieces of orbital debris. One mission will take approximately six months and the system is designed to allow for a 30 deg inclination change on the outgoing and incoming trips of the transfer vehicle. Author (revised)

The Mars Aquarius Mission is designed to carry out several scientific studies of the surface and subsurface of Mars with an emphasis on locating subterranean water. This mission is a precursor to a manned mission to Mars. A manned mission will require an extended stay on the planet's surface, and an accessible source of water will greatly simplify life support requirements. Using data from previous Mars observations, four sites were selected as possible locations of subsurface water. The Aquarius spacecraft carries one penetrator for each of these sites. Author

The Idaho National Engineering Laboratory (INEL) is conducting intensive research in the design and development of a small excore heat-pipe-thermionic space nuclear reactor power system (SEHPTR). The SEHPTR spacecraft will be able to supply 40 kW of power in any given orbit. The key components in this reactor are the thermionic heat pipes. The heat pipes have two major functions: (1) to convert heat energy into electrical energy, and (2) to radiate the excess heat to space. Thermionic power conversion is the process of converting heat energy into electrical energy with no moving parts. Heat is applied to the cathode surface. This heat will boil off electrons that will jump across the gap to the cooler surface of the anode, which will cause a potential difference between the two plates and induce a current through the load. Thermionic power conversion is incorporated as part of the heat pipe. The heat pipe, which is being developed by Thermacore Inc., is actually two heat pipes. It uses a radial heat pipe, called the emitter, and an axial heat pipe collector. The emitter heat pipe will pass the heat from the nuclear core to the cathode surface. The collector heat pipe keeps the anode surface cooler by transferring the heat from the anode surface and radiating it to space. Author (revised)

One of the topics available to the 1990-91 Aerospace Engineering senior class was the development of a preliminary design of an unmanned cargo ferry that would support the Mars mission by bringing equipment and supplies from a low Earth orbit (LEO) to a low Mars orbit (LMO). Several previous studies initiated by NASA have indicated that low-thrust transportation systems seem to offer the best performance for Mars missions. Such systems are characterized by long spiral times during escape and capture maneuvers, high payload mass fractions, and, typically, low propellant mass fractions. Of two main low-thrust candidates, nuclear electric propulsion (NEP) and solar electric propulsion (SEP), only the first one received extensive consideration because it seemed to represent the most promising concept for a manned mission to Mars. However, any sustained Mars initiative will have to include an unmanned cargo transportation system, for which an SEP concept deserves very careful consideration. The key assumptions and requirements established in cooperation with the Space Exploration Initiative office at the NASA Langley Research Center were (1) vehicle is assembled at the Space Station Freedom (SSF); (2) Earth-to-orbit delivery of the vehicle components, propellant, and payload is via shuttle-C; (3) vehicle's cargo mass is 61,000 kg; (4) vehicle delivers cargo to LMO at an altitude of 500 km and inclination of 70 deg; (5) vehicle returns (without cargo) to SSF; (6) vehicle should be reusable for at least three missions; and (7) vehicle is powered by ion argon thrusters. Two configurations were developed by two student teams, working mostly independently. Author (revised)

ANTARES: A LOW COST MODULAR LAUNCH VEHICLE FOR THE FUTURE **c15**
In Universities Space Research Association, Houston, Proceedings of the Seventh Annual Summer Conference. NASA/USRA: University Advanced Design Program 1991 p 317-328 (For primary document see N93-29712 11-01)
Avail: CASI HC A03/MF A03

The single-stage-to-orbit launch vehicle Antares is a revolutionary concept based on identical modular units, enabling the Antares to efficiently launch communications satellites, as well as heavy payloads, into Earth orbit and beyond. The basic unit of the modular system, a single Antares vehicle, is aimed at launching approximately 10,000 kg (22,000 lb) into low Earth orbit (LEO). When coupled with a standard Centaur upper stage, it is capable of placing 4000 kg (8800 lb) into geosynchronous Earth orbit (GE0). The Antares incorporates a reusable engine, the Dual Mixture Ratio Engine (DMRE), as its propulsive device. This enables Antares to compete and excel in the satellite launch market by dramatically reducing launch costs. Inherent in the design is the capability to attach several of these vehicles together to provide heavy lift capability. Any number of these vehicles can be attached depending on the payload and mission requirements. With a seven-vehicle configuration, the Antares' modular concept provides a heavy lift capability of approximately 70,000 kg (154,000 lb) to LEO. This expandability allows for a wide range of payload options, such as large Earth satellites, Space Station Freedom material, and interplanetary spacecraft, and also offers a significant cost savings over a mixed fleet based on different launch vehicles. Advanced, second-generation lunar habitats for astronauts and mission specialists working on the Moon are investigated. The work was based on design constraints set forth in previous publications. Design recommendations are based on environmental response to the lunar environment, habitability, safety, near-term technology, replaceability and modularity, and suitability for NASA lunar research missions in the early 21st century. Scientists, engineers, and architects from NASA/JSC, Wisconsin aeronautical industry, and area universities gave technical input and offered critiques at design reviews throughout the process. The recommended design uses a lunar lava tube, with construction using a combination of Space Station Freedom-derived modules and lightweight Kevlar-laminate inflatables. The outpost includes research laboratories and biotron, crew quarters and support facility, mission control, health maintenance facility, and related areas for functional and psychological requirements. Furniture, specialized equipment, and lighting are included in the design analysis. Author

This project which began in 1986 as part of the Worcester Polytechnic

Institute (WPI) Advanced Space Design Program focuses on the design and implementation of an electromechanical system for studying vortex behavior in a microgravity environment. Most of the existing equipment was revised and redesigned by this project team, as necessary. Emphasis was placed on documentation and integration of the electrical and mechanical subsystems. Project results include reconfiguration and thorough testing of all hardware subsystems, implementation of an infrared gas entrainment detector, new signal processing circuitry for the ultrasonic fluid circulation device, improved prototype interface circuits, and software for overall control of experiment operation. A workshop was convened by the FAA and NASA for the purpose of providing a forum at which leading designers, manufacturers, and users of helicopter simulators could initiate and participate in a development process that would facilitate the formulation of qualification standards by the regulatory agency. Formal papers were presented, special topics were discussed in breakout sessions, and a draft FAA advisory circular defining specifications for helicopter simulators was presented and discussed. A working group of volunteers was formed to work with the National Simulator Program Office to develop a final version of the circular. The workshop attracted 90 individuals from a constituency of simulator manufacturers, training organizations, the military, civil regulators, research scientists, and five foreign countries. For individual titles, see N93-30674 through N93-30691.

HELICOPTER SIMULATOR STANDARDS **c09**
Edward M. Boothe *In its* NASA/FAA Helicopter Simulator Workshop Apr. 1992 p 31-33 (For primary document see N93-30673 11-01)
Avail: CASI HC A01/MF A02

The initial advisory circular was produced in 1984 (AC 120-XX). It was not finalized, however, because the FAR's for pilot certification did not recognize helicopter simulators and, therefore, permitted no credit for their use. That is being rectified, and, when the new rules are published, standards must be available for qualifying simulators. Because of the lack of a data base to support specification of these standards, the FAA must rely on the knowledge of experts in the simulator/training industry. A major aim of this workshop is to form a working group of these experts to produce a set of standards for helicopter training simulators. Author

This paper reviews some of the unique considerations that distinguish the commercial rotary wing domain from its fixed-wing counterpart. These considerations should give the FAA cause to proceed cautiously in drawing upon its fixed-wing experience. One major point to consider is the following: device qualification should be accomplished in a context of an overall training and qualification system. This approach would take as its starting point a detailed analysis of rotary-wing missions and tasks from which proficiency objectives can be systematically developed. Author (revised)

ROTORCRAFT MASTER PLAN
Peter V. Hwoschinsky *In its* NASA/FAA Helicopter Simulator Workshop Apr. 1992 p 39-44 (For primary document see N93-30673 11-01)
Avail: CASI HC A02/MF A02

The Rotorcraft Master Plan contains a comprehensive summary of active and planned FAA vertical flight research and development. Since the Master Plan is not sufficient for tracking project status and monitoring progress, the Vertical Flight Program Plan will provide that capability. It will be consistent with the Master Plan and, in conjunction with it, will serve to ensure a hospitable environment if the industry presents a practical vertical-flight initiative. Author

Avail: CASI HC A01/MF A02

Corporate aviation relies heavily on simulation to meet training and evaluation requirements. It appreciates the savings in fuel, money, noise, and time, and the added safety it provides. Also, simulation provides opportunities to experience many emergencies that cannot be safely practiced in the aircraft. There is a need to focus on the advantages of simulator training over aircraft training and to provide appropriate changes in the regulations to allow the community to make it possible for users to take full advantage of simulation. Over 9,000 pilot training courses have been conducted at FSI using the Bell 222 and Sikorsky S-76 simulators. Through the use of FAA exemptions, these simulators can be used for certain training and checking credit. The history of the development and use of commercial helicopter simulators and the opportunities for their increased utilization and use were explored. Author

Petroleum Helicopters, Inc. maintains a staff of 750 helicopter pilots.

The initial, transition, upgrade, and recurrent training for these pilots requires a significant financial outlay. Since a major portion of that training is done to satisfy the requirements of FAR 61.57, 'Recent Flight Experience, Pilot in Command' and 135.297, 'Pilot in Command: Instrument Proficiency Check Requirements', much could be accomplished using an approved simulator. However, it is imperative that credit be given for training time spent in the simulators and that the device be realistic, practical, and affordable.

The opportunities for improved training and checking by using helicopter simulators are greater than they are for airplane pilot training. Simulators permit the safe creation of training environments that are conducive to the development of pilot decision-making, situational awareness, and cockpit management. This paper defines specific attributes required in a simulator to meet a typical helicopter operator's training and checking objectives.

Simulators will gain an increasingly important role in training helicopter pilots only if the simulators are of sufficient fidelity to provide positive transfer of skills to the aircraft. This must be done within an economic model of return on investment. Although rotor pilot demand is still only a small percentage of overall pilot requirements, it will grow in significance. This presentation described the salient factors influencing the use of helicopter training simulators. Author (revised)

The U.S. military uses a large number of simulators to train and sustain the flying skills of helicopter pilots. Despite the enormous resources required to purchase, maintain, and use those simulators, little effort has been expended in assessing their training effectiveness. One reason for this is the lack of an evaluation methodology that yields comprehensive and valid data at a practical cost. Some of these methodological problems and issues that arise in assessing simulator training effectiveness, as well as problems with the classical transfer-of-learning paradigm were discussed.

Helicopter simulators have been approved by means of special exemption; there are no FAA standards for simulators used in training or airmen Certification checking. The fixed-wing industry provides a precedent which can be used for expediting implementation of helicopter simulators. The analysis in this paper is founded on the experience with that precedent and is driven by a clear definition of helicopter user needs for (1) improved training at lower cost, (2) more comprehensive emergency training at lower risk, (3) increased fidelity of transition and instrument training compared with low-cost aircraft alternatives, and (4) certification credit for improved simulator training. VALIDATION AND UPGRADING OF PHYSICALLY BASED MATHEMATICAL MODELS c64
Ronald DuVal *In its* NASA/FAA Helicopter Simulator Workshop Apr. 1992 p 123-129 (For primary document see N93-30673 11-01)
Avail: CASI HC A02/MF A02

The validation of the results of physically-based mathematical models against experimental results was discussed. Systematic techniques are used for: (1) isolating subsets of the simulator mathematical model and comparing the response of each subset to its experimental response for the same input conditions; (2) evaluating the response error to determine whether it is the result of incorrect parameter values, incorrect structure of the model subset, or unmodeled external effects of cross coupling; and (3) modifying and upgrading the model and its parameter values to determine the most physically appropriate combination of changes. FREQUENCY-RESPONSE TECHNIQUES FOR DOCUMENTATION AND IMPROVEMENT OF ROTORCRAFT SIMULATORS c09
Mark B. Tischler *In its* NASA/FAA Helicopter Simulator Workshop Apr. 1992 p 131-146 (For primary document see N93-30673 11-01)
Avail: CASI HC A03/MF A02

Pilot-in-the-loop characterizations are most naturally formulated in terms of end-to-end frequency responses, so a frequency-response-based method is the natural approach to assessing simulator dynamic fidelity. A comprehensive frequency-response approach used heavily by Ames Research Center researchers was described, and results were presented

from a number of simulator fidelity assessment studies. Those studies included UH-60 mathematical model validation and upgrade, ASTOVL linear model extraction, and documentation of the Vertical Motion Simulator (at Ames Research Center) motion and visual system characteristics.

METHODOLOGY DEVELOPMENT FOR EVALUATION OF SELECTIVE-FIDELITY ROTORCRAFT SIMULATION **c09**
William D. Lewis, D. P. Schrage, J. V. R. Prasad, and Daniel Wolfe *In its* NASA/FAA Helicopter Simulator Workshop Apr. 1992 p 161-166 (For primary document see N93-30673 11-01)
Avail: CASI HC A02/MF A02

This paper addressed the initial step toward the goal of establishing performance and handling qualities acceptance criteria for realtime rotorcraft simulators through a planned research effort to quantify the system capabilities of 'selective fidelity' simulators. Within this framework the simulator is then classified based on the required task. The simulator is evaluated by separating the various subsystems (visual, motion, etc.) and applying corresponding fidelity constants based on the specific task. This methodology not only provides an assessment technique, but also provides a technique to determine the required levels of subsystem fidelity for a specific task. Derived from text

EFFECT OF CANARD WING POSITIONS ON AERODYNAMIC CHARACTERISTICS OF SWEPT-FORWARD WING
Zhang Binqian and B. Laschka 25 Feb. 1993 17 p Transl. into ENGLISH from Kongqidonglixue Xuebao (China), v. 8, no. 4, Dec. 1990 p 404-408
(AD-A262373; FASTC-ID(RS)T-0825-92) Avail: CASI HC A03/MF A01

Based on force measurements, oil flow observations, and eddy measurements in low air-speed wind tunnels, the paper studies the mechanism underlying the effect of canard wing positions on the aerodynamic characteristics of swept-forward canard wing configurations. As shown in studies, canard wing positions play the most significant role with respect to aerodynamic characteristics. Improvements in characteristics through a large incident angle in the swept-forward canard wing configuration depends on the relative position and the mutual control of the eddy at the leading edge of main wing. Based on the experimental results of an assembly with swept-forward and swept-back canard wing as well as the main wing, the paper presents the two- dimensional shapes of the canard and main wings, as well as their relative positions when adopting canard configuration. in addition, the authors express some of their views on the configuration of dual swept forward wings. THE NUMERICAL SOLUTION OF LOW MACH NUMBER FLOW IN CONFINED REGIONS BY RICHARDSON EXTRAPOLATION
B. Christer V. Johansson 25 Mar. 1992 40 p
(Contracts N00014-83-K-0422; NUTEK-726-91-01071; TFR-91-402)
(TRITA-NA-9207) Avail: CASI HC A03/MF A01

We use artificial compressibility together with Richardson extrapolation in the Mach number M as a method for solving the time dependent Navier-Stokes equation for very low Mach number flow and for incompressible flow. The question of what boundary conditions one should use for low Mach number flow, especially at inflow and outflow boundaries, is investigated theoretically, and boundary layer suppressing boundary conditions are derived. For the case of linearization around a constant flow we show that the low Mach number solution will converge with the rate O(M-squared) to the true incompressible solution, provided that we choose the boundary conditions correctly. However, if the boundary conditions are chosen incorrectly, it might happen that the low Mach number solution converges to an incompressible solution that looks physical, even though the difference between the true incompressible solution and the limit solution derived as M-squared approaches 0 is O(1). The reason is that the limit solution in this case does not satisfy the boundary conditions. The results of numerical calculations for the time dependent, nonlinear equations and for flow situations with time dependent inflow velocity profiles are presented. The convergence rate M-squared to incompressible solution is numerically confirmed. It is also shown that using Richardson extrapolation to M-squared = 0 in order to derive a solution with very small divergence can with good result be carried through with M-squared as large as 0.1 and 0.05. As the time step in numerical methods must be chosen approximately such that delta-t x (i/M delta-x + v/delta-x squared) is in the stability region of the time stepping method, and as M-squared = 0.05 is sufficiently small to yield good results, the restriction on the time step due to the Mach number is not serious. Therefore the equations can be integrated very fast by explicit time stepping methods. This method for solving very low Mach number flow and incompressible flow is well suited to parallel processing. TRANSONIC FLOWS ON AN OSCILLATING AIRFOIL AND THEIR EFFECT ON THE FLUTTER-BOUNDARY Ph.D. Thesis - Technische Univ. Munich [TRANSSONISCHE STROEMUNGEN AN EINEM SCHWINGENDEN PROFIL UND DEREN EINFLUSS AUF DIE FLATTERGRENZE]
Lorenz Tichy May 1992 145 p In GERMAN
(DLR-FB-92-08; ETN-93-93733) Avail: CASI HC A07/MF A02; DLR, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

A mount system for experiments on a two dimensional airfoil in a transonic wind tunnel is described. The system permits the measurement of static and dynamic pressure distributions and forces as well as flutter experiments. The study is based on results for the NACA 0012 airfoil oscillating in plunging and pitching modes. Different types of pressure fluctuations for weak and strong shocks and for shock induced separation are detailed. Flutter calculations based on measured unsteady aerodynamic derivatives show the effect of these pressure fluctuations on the flutter boundary in transonic flow. ESA

THE DEVELOPMENT OF A PARACHUTE SYSTEM FOR AERIAL DELIVERY FROM HIGH SPEED CARGO AIRCRAFT
V. L. Behr 1992 11 p Presented at the 12th Royal Aeronautical Society/AIAA Aerodynamic Decelerator Systems Technical Conference, London, England, 10 May 1993
(Contract DE-AC04-76DP-00789)
(DE93-008339; SAND-92-1889C; CONF-930580-2) Avail: CASI HC A03/MF A01

Supply of military personnel on the ground with cargo has long been accomplished with parachute delivery systems from aircraft. Structural limits of aircraft have typically limited these operations to no more than 150 KCAS. A desire for increased survivability of cargo delivery aircraft has led to the development and fielding of aircraft capable of delivering cargo at substantially higher speeds. This paper describes efforts undertaken to design develop and test a cargo delivery system for use at speeds compatible with those high speed cargo aircraft. DOE

AN EXPERIMENTAL STUDY OF FLOW OVER A 6 TO 1 PROLATE SPHEROID AT INCIDENCE Ph.D. Thesis
Seungki Ahn 1992 307 p
Avail: Univ. Microfilms Order No. DA9306841

In two-dimensional flow, the point of flow separation from the surface coincides with the point at which the skin friction vanishes. However, in three-dimensional flow, the situation is much more complex and the flow separation is rarely associated with the vanishing of the wall shear stress except in a few special cases. Though the effects of cross-plane separation are substantial and have been recognized for some time, the phenomenon of flow separation over three-dimensional bodies is still far from being completely understood. The flow is so complex that no completely satisfactory analytical tools are available at the moment. In an attempt to logically identify the various effects and parametric dependence while simultaneously minimizing configuration dependent issue, the flow over a 6 to 1 prolate spheroid, which is a generic three dimensional body, is investigated. For the identification of the general flow pattern and better understanding of the flow field, surface-oil-flow visualization tests and force and moment tests were performed. The angle of attack effect and Reynolds number effect on the separation location are studied with natural transition. Forces and moments tests, surface pressure distribution measurements as well as the surface pressure fluctuations, and mini-tuft flow visualization tests were made to document the flow characteristics on the surface of the body with an artificial boundary layer trip. It was found that there exists a critical Reynolds number at which the flow characteristics of the after body changes. This critical Reynolds number was also confirmed by the force and moment tests. Above this Reynolds number, as the Reynolds number increases, the separation lines do not change their circumferential location but stretch to the upstream of the body. For the low super critical Reynolds number range, the angle of attack effect on the location of the primary separation is not as prominent as in the higher Reynolds number range where the crossflow component effect becomes dominant. Surface pressure fluctuation data and surface pressure spectra were measured and documented for the first time for this type of three-dimensional flow. For the extension of the study to unsteady transient motion effects, a new Dynamic-Plunge-Pitch-Roll (DyPPiR) model mount was designed and developed to generate required transient motions. The measurements carried out are to be used as reference data to identify the unsteady transient effect of the flow field undergoing unsteady transient maneuvers. Dissert. Abstr.

PERFORMANCE CHARACTERISTICS OF TWO MULTIAXIS THRUST-VECTORING NOZZLES AT MACH NUMBERS UP TO 1.28
David J. Wing and Francis J. Capone Washington May 1993 111 p
(RTOP 505-62-30-01)
(NASA-TP-3313; L-17151; NAS 1.60:3313) Avail: CASI HC A06/MF A02

The thrust-vectoring axisymmetric (VA) nozzle and a spherical convergent flap (SCF) thrust-vectoring nozzle were tested along with a baseline nonvectoring axisymmetric (NVA) nozzle in the Langley 16-Foot Transonic Tunnel at Mach numbers from 0 to 1.28 and nozzle pressure ratios from 1 to 8. Test parameters included geometric yaw vector angle and unvectored divergent flap length. No pitch vectoring was studied. Nozzle drag, thrust minus drag, yaw thrust vector angle, discharge coefficient, and static thrust performance were measured and analyzed, as well as external static pressure distributions. The NVA nozzle and the VA nozzle displayed higher static thrust performance than the SCF nozzle throughout the nozzle pressure ratio (NPR) range tested. The NVA nozzle had higher overall thrust minus drag than the other nozzles throughout the NPR and Mach number ranges tested. The SCF nozzle had the lowest jet-on nozzle drag of the three nozzles throughout the test conditions. The SCF nozzle provided yaw thrust angles that were equal to the geometric angle and constant with NPR. The VA nozzle achieved yaw thrust vector angles that were significantly higher than the geometric angle but not constant with NPR. Nozzle drag generally increased with increases in thrust vectoring for all the nozzles tested. Author (revised)

EVALUATION OF FOUR ADVANCED NOZZLE CONCEPTS FOR SHORT TAKEOFF AND LANDING PERFORMANCE
P. Frank Quinto, Guy T. Kemmerly, and John W. Paulson, Jr. Jun. 1993 98 p Sponsored by NASA, Washington
(RTOP 505-59-30-02)
(NASA-TP-3314; L-16998; NAS 1.60:3314) Avail: CASI HC A05/MF A02

Four advanced nozzle concepts were tested on a canard-wing fighter in the Langley 14- by 22-Foot Subsonic Tunnel. The four vectoring-nozzle concepts were as follows: (1) an axisymmetric nozzle (AXI); (2) an asymmetric, load balanced exhaust nozzle (ALBEN); (3) a low aspect ratio, single expansion ramp nozzle (LASERN); and (4) a high aspect ratio, single expansion ramp nozzle (HASERN). The investigation was conducted to determine the most suitable nozzle concept for short takeoff and landing (STOL) performance. The criterion for the best STOL performance was a takeoff ground roll of less than 1000 ft. At approach, the criteria were high lift and sufficient drag to maintain a glide slope of -3 to -6 deg with enough pitching-moment control from the canards. The test was performed at a dynamic pressure of 45 lb/sq ft and an angle-of-attack range of 0 to 20 deg. The nozzle pressure ratio was varied from 1.0 to 4.3 at both dry power and after burning nozzle configurations with nozzle vectoring to 60 deg. In addition, the model was tested in and out of ground effects. The ALBEN concept was the best of the four nozzle concepts tested for STOL performance. Author (revised)

HYPERSONIC LATERAL AND DIRECTIONAL STABILITY CHARACTERISTICS OF AEROASSIST FLIGHT EXPERIMENT CONFIGURATION IN AIR AND CF4
John R. Micol and William L. Wells Washington Jun. 1993 42 p
(RTOP 506-40-41-01)
(NASA-TM-4435; L-17154; NAS 1.15:4435) Avail: CASI HC A03/MF A01

Hypersonic lateral and directional stability characteristics measured on a 60 deg half-angle elliptical cone, which was raked at an angle of 73 deg from the cone centerline and with an ellipsoid nose (ellipticity equal to 2.0 in the symmetry plane), are presented for angles of attack from -10 to 10 deg. The high normal-shock density ratio of a real gas was simulated by tests at a Mach number of 6 in air and CF4 (density ratio equal to 5.25 and 12.0, respectively). Tests were conducted in air at Mach 6 and 10 and in CF4 at Mach 6 to examine the effects of Mach number, Reynolds number, and normal-shock density ratio. Changes in Mach number from 6 to 10 in air or in Reynolds number by a factor of 4 at Mach 6 had a negligible effect on lateral and directional stability characteristics. Variations in normal-shock density ratio had a measurable effect on lateral and directional aerodynamic coefficients, but no significant effect on lateral and directional stability characteristics. Tests in air and CF4 indicated that the configuration was laterally and directionally stable through the test range of angle of attack. Author (revised)

KINETICS AND ENERGY TRANSFER IN NONEQUILIBRIUM FLUID FLOWS Final Report, 17 Jun. 1990 - 16 Sep. 1992
David R. Crosley 3 Feb. 1993 70 p
(Contract DAAL03-90-K-0001)
(AD-A263612; ARO-27864.3-EG-SDI) Avail: CASI HC A04/MF A01

Chemical kinetics and energy transfer have been investigated for nonequilibrium fluid flow. The particular process of interest is ultraviolet emission from the A2 sigma + excited electronic state of NO, which is generated under nonequilibrium conditions in the bow shock waves of ascending missiles at 50 to 100 km altitude. A literature survey of the pertinent rate constants and mechanism for use in computer models of the process has been undertaken. Emission from NO has been studied in shock tubes, using shock heated air and other gas mixtures. Collisional quenching of the A2 sigma + state is the reverse of heavy particle excitation of the emission. Its temperature dependence has been studied in a heated cell and a shock tube. An attempt was made to determine the final vibrational state distribution in the ground electronic state, concluding that the NO is transferred into high vibrational levels. DTIC

MODAL SURVEY OF A FULL-SCALE F-18 WIND TUNNEL MODEL Interim Report, Mar. 1991 - Jul. 1992
Vincent J. Levraea, Douglas A. Henderson, Arnel P. Pacia, and Michael P. Banford Sep. 1992 63 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A262482; WL-TM-92-350-FIBG) Avail: CASI HC A04

The purpose of this investigation was to perform a ground vibration test (GVT) to determine the resonant frequencies, damping, and mode shapes for the F-18 vertical tail structure. This effort represents a subtask of the twin tail buffet work currently studying the buffet response of the F-18 vertical tails to forebody vortices generated at high angles of attack. The GVT was conducted on a full-scale F-18 airframe which had been significantly modified to enable it for use as a full-scale wind tunnel model in the NASA Ames 80 ft x 120 ft wind tunnel facility. Because the major emphasis of the test was to obtain the dynamic characteristics of the vertical tails under tunnel mounting conditions, the GVT was performed with the full-scale model mounted on the tunnel pedestals in the same configuration as would be used for the wind tunnel tests. The primary excitation frequencies of the vortical wake were expected to be below 100 hertz, thus the GVT only measured tail response frequencies below this value. The results give dynamic response information for the first bending, second bending, and first torsional modes of the vertical tails. DTIC

HIGH-REYNOLDS-NUMBER TEST OF A 5-PERCENT-THICK LOW-ASPECT-RATIO SEMISPAN WING IN THE LANGLEY 0.3-METER TRANSONIC CRYOGENIC TUNNEL: WING PRESSURE DISTRIBUTIONS
Julio Chu and Pierce L. Lawing Dec. 1990 201 p
(RTOP 505-61-01-01)
(NASA-TM-4227; L-16704; NAS 1.15:4227) Avail: CASI HC A10/MF A03

A high Reynolds number test of a 5 percent thick low aspect ratio semispan wing was conducted in the adaptive wall test section of the Langley 0.3 m Transonic Cryogenic Tunnel. The model tested had a planform and a NACA 64A-105 airfoil section that is similar to that of the pressure instrumented canard on the X-29 experimental aircraft. Chordwise pressure data for Mach numbers of 0.3, 0.7, and 0.9 were measured for an angle-of-attack range of -4 to 15 deg. The associated Reynolds numbers, based on the geometric mean chord, encompass most of the flight regime of the canard. This test was a free transition investigation. A summary of the wing pressures are presented without analysis as well as adapted test section top and bottom wall pressure signatures. However, the presented graphical data indicate Reynolds number dependent complex leading edge separation phenomena. This data set supplements the existing high Reynolds number database and are useful for computational codes comparison. Author

A wind tunnel investigation was conducted to determine the 2-D aerodynamic characteristics of a new rotorcraft airfoil designed for application to the tip region (stations outboard of 85 pct. radius) of a helicopter main rotor blade. The new airfoil, the RC(6)-08, and a baseline airfoil, the RC(3)-08, were investigated in the Langley 6- by 28-inch transonic tunnel at Mach numbers from 0.37 to 0.90. The Reynolds number varied from 5.2 x 10(exp 6) at the lowest Mach number to 9.6 x 10(exp 6) at the highest Mach number. Some comparisons were made of the experimental data for the new airfoil and the predictions of a transonic, viscous analysis code. The results of the investigation indicate that the RC(6)-08 airfoil met the design goals of attaining higher maximum lift coefficients than the baseline airfoil while maintaining drag divergence characteristics at low lift and pitching moment characteristics nearly the same as those of the baseline airfoil. The maximum lift coefficients of the RC(6)-08 varied from 1.07 at M=0.37 to 0.94 at M=0.52 while those of the RC(3)-08 varied from 0.91 to 0.85 over the same Mach number range. At lift coefficients of -0.1 and 0, the drag divergence Mach number of both the RC(6)-08 and the RC(3)-08 was 0.86. The pitching moment coefficients of the RC(6)-08 were less negative than those of the RC(3)-08 for Mach numbers and lift coefficients typical of those that would occur on a main rotor blade tip at high forward speeds on the advancing side of the rotor disk. The ability to predict the complete set of aerodynamic performance parameters for projectile configurations has been a stated goal of the Computational Aerodynamics Branch, U.S. Army Ballistic Research Laboratory. In order to achieve this goal, predictive capabilities which utilize Navier-Stokes computational techniques have been developed and applied to an extensive number of projectile configurations. A summary of code validation efforts and applications for both spin stabilized and fin stabilized projectile configurations are described. Significant progress in the predictive capability for projectile aerodynamics has been achieved through the availability of substantial supercomputer resources and modern computational techniques. Current and future research areas of interest are described and provide an indication of computer resources and code enhancements needed to continue the progress in projectile computational aerodynamics. SOLUTION OF EULER EQUATIONS FOR FOREBODY-INLET ENSEMBLE OF AIRCRAFT AT HIGH ANGLE OF ATTACK
Zheng Xiaoqing and Shen Huili 27 Apr. 1993 19 p Transl. into ENGLISH from unidentified Chinese language document p 161-168
(AD-A263905; FASTC-ID(RS)T-0870-92) Avail: CASI HC A03/MF A01

A computational procedure was developed to simulate inviscid flows over integrated forebody-inlet ensemble of an aircraft model. The analysis, which includes the effect of Mach number, angle of attack, and engine mass flow is based on the solution of three-dimensional Euler equations. A finite-volume spatial discretization and a Runge-Kutta time stepping scheme are employed in solving the equations. To achieve the required geometric flexibility, a multizone mesh is used. The entire computational domain is divided into three zones. The mesh of each zone is generated by interpolating the fluxes across the interface between adjacent zones during iterations. A new type of treatment of inlet exit boundary conditions was developed and tested. The procedure was applied to forebody-inlet analysis for a range of flight conditions including subsonic, transonic, and supersonic flight with various engine mass flows and angles of attack. In addition, the steady states of supersonic flight up to 15 degrees of angle of attack for the subcritical engine regime were obtained. The results are in good agreement with the experimental data. UNSTEADY VORTEX LOOP/DIPOLE THEORY APPLIED TO THE WORK AND ACOUSTICS OF AN IDEAL LOW SPEED PROPELLER Progress Report

Earl Quandt Mar. 1993 28 p

(AD-A264057; CDNSWC/PAS-92/52) Avail: CASI HC A03/MF A01

The vortex loop/dipole singularities used to simulate blade lift and thickness in potential flow models of turbomachines are examined in an unsteady form. The three-dimensional potential fields created as these singularities rotate in the absolute frame are shown to provide the input forces, ideal work and wake energy for an incompressible fluid, as well as the tonal acoustics for slight compressibility. For typical low Mach number propellers, the sound field is dominated by the lift force and exhibits large cancellation effects with multiple blades. It is concluded that the unsteady formulation illustrates well the physics of a turbomachine, and in addition, highlights some basic principles of potential flow. DTIC

THE APPLICATION OF CONCENTRIC VORTEX SIMULATION TO CALCULATING THE AERODYNAMIC CHARACTERISTICS OF BODIES OF REVOLUTION AT HIGH ANGLES OF ATTACK

Ban Xianlin and Tu Xing 27 Apr. 1993 16 p Transl. into ENGLISH from Kongqidonglixue Xuebao (China), v. 8, no. 2, 1990 p 161-167

(AD-A263879; FASTC-ID(RS)T-0869-92) Avail: CASI HC A03/MF A01

The aerodynamic characteristic of sharp nosed bodies of revolution is calculated by using concentric vortex simulation in this paper. Based on the experimental results, an appropriate set of free integration parameters is selected and an empirical relation between initial separation angle and the Reynolds number is established. Thus, the effect of the Reynolds number is reasonably considered in the calculation. The effect of the Mach number is corrected by using Gothert's rule. The differential equations of vortex motion are solved by using the fourth order Runge Kutta method with varying step size. Three different initial step sizes are used in different integration positions in order to increase the speed of calculation. Two models (F3Al6 and F3.5A7) were calculated in this paper. DTIC

SONIC BOOM PROBLEM FOR FUTURE HIGHSPEED AIRCRAFT [LE PROBLEME DU BANG SONIQUE POUR DE FUTURS AVIONS DE TRANSPORT A HAUTE VITESSE]

Andre Auriol, Claude Lecomte, and Christian Thery 1990 52 p In FRENCH

(ONERA-NT-1990-3; ETN-93-93723) Avail: CASI HC A04/MF A01

The various physical characteristics of sonic booms are recalled: origin, atmospheric propagation, and circumstances under which focusing takes place. The main effects on structures and living creatures are outlined. The only noticeable nuisance from the sonic boom is due to the fact that it startles people. This reaction increases in intensity with the severity of the boom and the steepness of the shock fronts. No acceptance threshold has been defined so far, but startle reactions become scarce for boom intensities less than 50 pascals, or for those booms having a shock front of weak intensity followed by a gradual compression. This milder reaction could, therefore, be attained by changing the aerodynamic geometry of the aircraft appropriately. It is, therefore, recommended that work continues, with the following: studies on startle reactions, to define bearable booms of unconventional shapes; and studies of the aerodynamic shapes of planes able to generate such booms. Ways also have to be found to reduce the effects of the unavoidable strengthening of the boom due to the transonic acceleration of the plane. ESA

A COMPUTATIONAL MODEL THAT COUPLES AERODYNAMIC AND STRUCTURAL DYNAMIC BEHAVIOR OF PARACHUTES DURING THE OPENING PROCESS Final Report, Oct. 1991 - Jan. 1993

Keith R. Stein, Richard J. Benney, and Earl C. Steeves Apr. 1993 31 p

(AD-A264115; Natick/TR-93/029) Avail: CASI HC A03/MF A01

In parachute research, the canopy inflation process is the least understood and most complex to model. Unfortunately, it is during the opening process that the canopy often experiences the largest deformations and loadings. The complexity of modelling the opening process stems from the coupling between the structural dynamics of the canopy, lines and payload with the aerodynamics of the surrounding fluid medium. The addition of a computational capability to model the coupled opening behavior would greatly assist in the understanding of the canopy inflation process. Ongoing research at the U.S. Army Natick Research, Development and Engineering Center (Natick) focuses on this coupled problem. The solution to the coupled problem is expected to assist in the development of future U.S. Army airdrop systems which include the capability of deploying at low altitudes and high speeds. A computational fluid dynamics (CFD) code and structural dynamic mass spring damper (MSD) code are coupled with an explicit marching method. The CFD flow solver provides the differential pressure values at node points along a radial which are used as input in the MSD model. The MSD code integrates the equations of motion for the canopy and returns current nodal positions and velocities to the CFD code. The node points on the MSD model coincide with a unique set of adjacent CFD grid points for all time. This coupled model predicts behavior for a quarter-scale C-9 parachute which compares favorably with experimentally determined behavior. DTIC

TURBULENCE CHARACTERISTICS OF AN AXISYMMETRIC REACTING FLOW Final Report
Richard D. Gould, Warren H. Stevenson, and H. Doyle Thompson Washington Feb. 1988 213 p
(Grant NAG3-502; RTOP 505-90-11)
(NASA-CR-4110; E-3813; NAS 1.26:4110) Avail: CASI HC A10/MF A03

Simultaneous two-componet laser velocimeter measurements were made in the turbulent flow field following an axisymmetric sudden expansion with and without combustion. The fuel (propane) and air were fully premixed to give a constant fuel-air ratio of 0.032 at the inlet (corresponding to an equivalence ratio of 0.5) for the combusting flow measurements. Reynolds number based on step height was 5.57 x 10 exp 4. The primary objective of the study was to obtain detailed measurements which would be of use to modelers. Quantities measured included mean axial and radial velocities, Reynolds stresses, and turbulent triple products. In addition, simultaneous time resolved temperature measurements were made in the reacting flow using high speed thermocouples. This permitted the computation of velocity-temperature correlations. Experimental results were compared to predictions from a widely used numerical code based on the k-epsilon turbulence model and the combustion model of Magnussen and Hjertager. Relatively good agreement was found for the cold flow case as in previous studies, but predicted values of temperature in the reacting flow case deviated substantially from the measurements. Sizable errors in the predictions for the velocity field also were found. Possible sources for the observed differences and suggestions for future model development are suggested.

COMPRESSIBLE TURBULENCE IN A HIGH-SPEED HIGH REYNOLDS NUMBER MIXING LAYER Ph.D. Thesis
Rodney Dale Welch Bowersox 1992 257 p
Avail: Univ. Microfilms Order No. DA9302663

Compressible turbulence in a high-speed, high Reynolds number, supersonic free shear layer was studied. A two-dimensional free mixing layer was chosen to study turbulence rather than a wall bounded flow due to the experimental fact that the effects of compressibility become significant at lower Mach numbers. The overall flow structure was documented with the shadowgraph and conventional mean flow probes. Image processing techniques were developed in order to determine root-mean-square index of refraction (density) fluctuation levels from the shadowgraph plates. The research concentrated on the Reynolds averaged form of the Navier-Stokes equations, where the effects of compressibility are manifested through 'apparent mass' terms (i.e. p'u'(sub i)). These terms appear in all of the Reynolds averaged Navier-Stokes equations (continuity, momentum, and energy). A new turbulence transformation, coupled with innovative experimental methods, allowed the full compressible Reynolds shear stress to be directly measured. The full compressible heat flux and apparent mass terms were also estimated from cross-wire results. Profiles were obtained at four downstream stations which were strategically located to map different levels of development of the shear flow. It was found, experimentally, that the effects of compressibility on turbulence were more than significant accounting for about 75 percent of the total level of the Reynolds shear stress formulation. For the present mean adiabatic flow, the compressible turbulence accounted for 100 percent of the turbulent heat flux. The apparent mass in the continuity equation was, by definition, only due to compressibility. These results led to the development of a new Compressible Apparent Mass Mixing Length Extension (CAMMLE) model that accounts for compressible turbulence in all of the governing equations. A total of seven turbulence models were experimentally evaluated: the CAMMLE model, the Prandtl incompressible and the Situ-Schetz compressible mixing length models, the Prandtl and Bradshaw turbulent kinetic energy (TKE) formulations, and two compressible TKE extensions that are based upon a newly defined compressible TKE formulation. The measured turbulence data was used to assess the various models, where the measured mean flow profiles were used in the model formulations. The incompressible formulations were generally successful in representing the measured incompressible part of the Reynolds shear stress. However, this term only accounted for about 25 percent of the total shear stress level. All of the compressible extensions provided accurate estimates of the full compressible Reynolds shear stress.

TURBULENT DRAG REDUCTION: STUDIES OF FEEDBACK CONTROL AND FLOW OVER RIBLETS Ph.D. Thesis
Haecheon Choi 1993 293 p
Avail: Univ. Microfilms Order No. DA9309581

The objective is to explore concepts for control of turbulent boundary layers leading to skin-friction reduction using the direct numerical simulation technique. Three different control methods are investigated; a passive control by longitudinal riblets, an active control by sensing and perturbing structures near the wall, and a feedback control procedure guided by control theory. In Part 1 significant drag reduction is achieved when the surface boundary condition is modified to suppress the dynamically significant coherent structures present in the wall region. The drag reduction is accompanied with significant reduction in the intensity of the wall layer structures and reductions in the magnitude of Reynolds shear stress throughout the flow. Two essential drag reduction mechanisms are presented. In Part 2 mathematical methods of control theory are applied to the problem of control of fluid flow. The procedure of how to cast the problem of controlling turbulence into a problem in optimal control theory is presented through the formalism and language of control theory. Then a suboptimal control and feedback procedure are presented using methods of calculus of variations through the adjoint state and gradient algorithms. This suboptimal feedback control procedure is applied to the distributed and boundary controls of the stochastic Burgers equation. Most cases considered show significant reductions of the costs. In Part 3 direct numerical simulation is performed to analyze turbulent flow over longitudinal riblets, and to reduce the mechanism of drag reduction by riblets. The computed drags on the riblet surfaces are in good agreement with the existing experimental data. Differences in the mean-velocity profile and turbulence quantities are found to be limited to the inner region of the boundary layer. Velocity and vorticity fluctuations as well as the Reynolds shear stresses above the riblets are reduced in drag-reducing configurations. Instantaneous flow fields near the riblets are investigated in detail and a physical explanation for the observed drag reduction is proposed. Dissert. Abstr.

A THEORETICAL AND COMPUTATIONAL STUDY ON ACTIVE WAKE CONTROL Ph.D. Thesis
Luca Cortelezzi 1993 165 p
Avail: Univ. Microfilms Order No. DA9307031

A two-dimensional unsteady separated flow past a semi-infinite plate with transverse motion is considered. The flow is assumed incompressible and at high Reynolds number. The rolling-up of the separated shear-layer is modeled by a point vortex whose time dependent circulation is predicted by an unsteady Kutta condition. A power-law starting flow is assumed along with a power-law for the transverse motion. The effects of the motion of the plate on the starting vortex circulation and trajectory are presented. A suitable vortex shedding mechanism is introduced and a class of flows involving several vortices is presented. Subsequently, a control strategy able to maintain constant circulation when a vortex is present is derived. An exact solution for the non-linear controller is then obtained. Dynamical system analysis is used to explore the performance of the controlled system. Finally, the control strategy is applied to a class of flows and the results are discussed. The previous results are extended to the case of a two dimensional unsteady separated flow past a plate of variable length. Again the rolling-up of the separated shear layer is modeled by a vortex pair whose time dependent circulation is predicted by an unsteady Kutta condition. A power-law starting flow is assumed while the plate length is kept constant. The results of the simulations are presented and the model validated. A time dependent scaling which unveils the universality of the phenomenon is discussed. The previous vortex shedding mechanism is implemented and a vortex merging scheme is tested in a class of flows involving several vortices and is shown to be highly accurate. Subsequently, a control strategy able to maintain constant circulation when a vortex pair is present is derived. An exact solution for the non-linear controller is obtained in the form of an ordinary differential equation. Dynamical system analysis is used to explore the performance of the controlled system and the existence of a controllability region is discussed. Finally, the control strategy is applied to two classes of flows and the results are presented. Dissert. Abstr.

N93-30947 Stanford Univ., CA.
THE NUMERICAL SIMULATION OF CIRCULATION CONTROLLED AIRFOIL FLOWFIELDS Ph.D. Thesis
Samuel Witherspoon Linton 1993 173 p
Avail: Univ. Microfilms Order No. DA9309631

A Circulation Controlled Airfoil has a rounded trailing edge, so that the rearward stagnation point is not fixed, but is free to move along the surface. In addition, it uses upper surface blowing near the trailing edge to energize the boundary layer, thus increasing its resistance to separation. Since the jet flow rate is controlled, there is direct control of the separation point location, and thus of the circulation and lift of the airfoil. The delayed separation of the boundary layer near the trailing edge can result in a very high maximum lift coefficient. The present research is the numerical simulation of two- and three-dimensional flows over a Circulation Controlled geometry using a fully implicit Navier-Stokes code, and the comparison to experimental results. Mach numbers of 0.3 and 0.5 and jet total to freestream pressure ratios of 1.4 and 1.8 are investigated. The Baldwin-Lomax and k-epsilon turbulence models are used, each modified to include the effect of strong streamline curvature. A new numerical technique is presented for the implicit treatment of the nonlinear source terms in the k-epsilon equations. In addition to the steady-state unstalled solutions, the first known numerical solutions of jet stalled Circulation Controlled Airfoil fields are computed. In two-dimensions, the alternation between adverse pressure gradient and shock induced separation of the boundary layer on the airfoil trailing edge results in a highly repeatable periodic flow field. The first known three-dimensional computations about a Circulation Controlled Wing are also performed. The steady state solutions on the aspect ratio 4 semispan wing show locally two-dimensional behavior inboard of about the 70 percent span station, but strong roll up of the jet sheet into the tip vortex outboard. The post-stall three-dimensional computations show the same mechanism of stall as the corresponding two-dimensional results, but the oscillations are somewhat less regular. The outboard flow field is strongly influenced by the unsteady tip vortex, and the stream-lines there are highly three-dimensional. In some cases, three-dimensionality is important inboard as well, since the oscillations in lift are not in phase over the wing, but seem to travel inboard along it. Dissert. Abstr.

THE HSCT MISSION ANALYSIS OF WAVERIDER DESIGNS Final Report, 15 May 1991 - 14 May 1993
1993 10 p
(Grant NAG1-1295)
(NASA-CR-193467; NAS 1.26:193467) Avail: CASI HC A02/MF A01

The grant provided partial support for an investigation of wave rider design and analysis with application to High-Speed Civil Transport (HSCT) vehicles. Proposed was the development of the necessary computational fluid dynamics (CFD) tools for the direct simulation of the waverider vehicles, the development of two new wave rider design methods that would provide computational speeds and design flexibilities never before achieved in wave rider design studies, and finally the selection of a candidate waverider-based vehicle and the evaluation of the chosen vehicle for a canonical HSCT mission scenario. This, the final report, reiterates the proposed project objectives in moderate detail, and it outlines the state of completion of each portion of the study, providing references to current and forthcoming publications that resulted from this work. WORLD COMMERCIAL AIRCRAFT ACCIDENTS
C. Y. Kimura Jan. 1993 517 p
(Contract W-7405-eng-48)
(DE93-010892; UCRL-ID-112905) Avail: CASI HC A22/MF A04

This report is a compilation of all accidents world-wide involving aircraft in commercial service which resulted in the loss of the airframe or one or more fatality, or both. This information has been gathered in order to present a complete inventory of commercial aircraft accidents. Events involving military action, sabotage, terrorist bombings, hijackings, suicides, and industrial ground accidents are included within this list. Included are the following topics: accidents involving world commercial jet aircraft, world commercial turboprop aircraft, world commercial pistonprop aircraft with four or more engines, and world commercial pistonprop aircraft with two or three engines from 1946 to 1992. Each accident is presented with information in the following categories: date of the accident, airline and its flight numbers, type of flight, type of aircraft, aircraft registration number, construction number/manufacturers serial number, aircraft damage, accident flight phase, accident location, number of fatalities, number of occupants, cause, remarks, or description (brief) of the accident, and finally references used. The sixth chapter presents a summary of the world commercial aircraft accidents by major aircraft class (e.g. jet, turboprop, and pistonprop) and by flight phase. The seventh chapter presents several special studies including a list of world commercial aircraft accidents for all aircraft types with 100 or more fatalities in order of decreasing number of fatalities, a list of collision accidents involving commercial aircrafts, and a list of world commercial aircraft accidents for all aircraft types involving military action, sabotage, terrorist bombings, and hijackings. A PASSIVE INFRARED ICE DETECTION TECHNIQUE FOR HELICOPTER APPLICATIONS

Adam L. Dershowitz and R. John Hansman, Jr. 20 Aug. 1991 54 p
(Grant NAG3-927)
(NASA-CR-193187; NAS 1.26:193187; ASL-91-4) Avail: CASI HC A04/MF A01

A technique has been developed, and successfully tested, to detect icing remotely on helicopter rotor blades. Using passive infrared (IR) thermometry it is possible to detect the warming caused by latent heat released as supercooled water freezes. During icing, the ice accretion region on the leading edge of the blade is found to be warmer than the uniced trailing edge resulting in a chordwise temperature profile characteristic of icing. Preliminary tests, using an IR Thermal video system, were conducted on a static model in the NASA Icing Research Tunnel (IRT) for a variety of wet (glaze) and dry (rime) ice conditions. A prototype detector system was built consisting of a single point IR pyrometer, and experiments were run on a small scale rotor model. Using this prototype detector, the characteristic chordwise temperature profiles were again observed for a range of icing conditions. Several signal processing methods were investigated, to allow automatic recognition of the icing signature. Additionally, several implementation issues were considered. Based on both the static and subscale rotor tests, where ice was successfully detected, the passive IR technique appears to be promising for rotor ice detection. Author (revised)

GENERATION OF CARBON MONOXIDE IN COMPARTMENT FIRES Ph.D. Thesis

Daniel T. Gottuk Dec. 1992 266 p
(Grant NANB-1-D1176)
(PB93-146702; NIST/GCR-92/619) Avail: Issuing Activity

A test compartment was used to investigate the burning of four fuels (hexane, PMMA, spruce, and flexible polyurethane foam) in compartment fires. Empirical correlations between the upper-layer yield of major species and the plume equivalence ratio were shown to exist. The results reveal that the production of CO is primarily dependent on the compartment flow dynamics and upper layer temperature. A chemical kinetic analysis indicated that increased compartment temperature affects upper-layer species yields in two ways: (1) the generation of species in the plume is changed, and (2) oxidation of post-flame gases in the layer is affected. The correlations developed in the compartment fires were qualitatively similar to those developed by Beyler for simplified upper-layer environments. The species yields downstream of hexane compartment fires were investigated and compared to upper-layer yields. Results showed that downstream CO yields can be correlated to the plume equivalence ratio when taking into account the occurrence of external burning. NTIS

FAA INTERNATIONAL CONFERENCE ON AIRPLANE GROUND DEICING

29 May 1992 317 p Conference held in Reston, VA, 28-29 May 1992
(AD-A263617) Avail: CASI HC A14/MF A03

On March 22, 1992 US Air Flight 405, departing from New York's La Guardia Airport, crashed on takeoff. The Federal Aviation Administration (FAA) is proceeding on the assumption that this tragedy was due to icing. In response, the FAA initiated a 6-month effort to improve the safety of winter flight operations. This effort will result in safety improvements that will be implemented before next winter. A better understanding of airplane ground deicing and anti-icing issues is a crucial prerequisite to the implementation of feasible and effective safety improvements. To achieve this goal, the FAA sponsored a conference at which the international aviation community could exchange thoughts and offer recommendation on a variety of issues concerning safe winter operations. On May 28 and 29, 1992, the FAA held the International Conference on Airplane Ground Deicing to develop a better understanding of airplane deicing and anti-icing issues. More than 750 participants discussed the problems posed by aircraft deicing and examined possible solutions. The conference produced suggestions for corrective actions the should be taken before this winter and possible long-term improvements to existing systems. The focus of the conference was carrier operated turbine-powered airplanes with more than 30 passenger seats. DTIC

AIR PIRACY AND TERRORISM DIRECTED AGAINST U.S. AIR CARRIERS Study Project

Charles E. Martin 5 Apr. 1993 32 p
(AD-A264120) Avail: CASI HC A03/MF A01

Air piracy and terrorism have presented an increasing challenge to the air carriers of the United States and to the air carriers of the rest of the world. The air carriers of the United States represent a particularly lucrative target because airlines are symbols of nations. Airliners, which may be carrying as many as 350 hostages or victims, can be pirated and controlled by a small force. Or they can be blown up by a small explosive device placed in baggage or cargo. Terrorist groups and air pirates differ significantly in their goals, aims, means, capabilities as well as many other characteristics. They represent causes and ideals which cover the ideological spectrum. No matter their cause or ideal they cause confusion and fear in the government and population of their target country. This study will examine air piracy and terrorism historically and provide a survey of more recent highly publicized and political acts against U.S. air carriers. DTIC

RESULTS OF DATAS INVESTIGATION OF ATCRBS ENVIRONMENT AT THE LOS ANGELES INTERNATIONAL AIRPORT Final Report, 14 Dec. 1992 - 15 Jan. 1993
Leo Wapelhorst, Thomas Pagano, and John VanDongen Apr. 1993 37 p
(Contract FAA-T1101-F)
(DOT/FAA/CT-93/6) Avail: CASI HC A03/MF A01

The deployment of the Data Link Test and Analysis System (DATAS) as a Traffic Alert and Collision Avoidance System (TCAS) monitor at the Los Angeles International Airport (LAX) is documented. The purpose was to identify aircraft which were reporting illegal Mode Select ID's. Data were also taken on the downlink portion of the environment in order to characterize the environment after the implementation of TCAS. The project was conducted by the Airborne Collision and Data Link Systems branch of the Federal Aviation Administration (FAA) Technical Center. Author (revised)

HELICOPTER APPROACH CAPABILITY USING THE DIFFERENTIAL GLOBAL POSITIONING SYSTEM M.S. Thesis
David N. Kaufmann Jun. 1993 56 p
(Contract NCC2-775)
(NASA-CR-193183; NAS 1.26:193183) Avail: CASI HC A04/MF A01

The results of flight tests to determine the feasibility of using the Global Positioning System (GPS) in the differential mode (DGPS) to provide high accuracy, precision navigation, and guidance for helicopter approaches to landing are presented. The airborne DGPS receiver and associated equipment is installed in a NASA UH-60 Black Hawk helicopter. The ground-based DGPS reference receiver is located at a surveyed test site and is equipped with a real-time VHF data link to transmit correction information to the airborne DGPS receiver. The corrected airborne DGPS information, together with the preset approach geometry, is used to calculate guidance commands which are sent to the aircraft's approach guidance instruments. The use of DGPS derived guidance for helicopter approaches to landing is evaluated by comparing the DGPS data with the laser tracker truth data. Both standard (3 deg) and steep (6 deg and 9 deg) glideslope straight-in approaches were flown. DGPS positioning accuracy based on a time history analysis of the entire approach was 0.2 m (mean) +/- 1.8 m (2 sigma) laterally and -2.0 m (mean) +/- 3.5 m (2 sigma) vertically for 3 deg glideslope approaches, -0.1 m (mean) +/- 1.5 m (2 sigma) laterally and -1.1 m (mean) +/- 3.5 m (2 sigma) vertically for 6 deg glideslope approaches and 0.2 m (mean) +/- 1.3 m (2 sigma) laterally and -1.0 m (mean) +/- 2.8 m (2 sigma) vertically for 9 deg glideslope approaches. DGPS positioning accuracy at the 200 ft decision height (DH) on a standard 3 deg slideslope approach was 0.3 m (mean) +/- 1.5 m (2 sigma) laterally and -2.3 m (mean) +/- 1.6 m (2 sigma) vertically. These errors indicate that the helicopter position based on DGPS guidance satisfies the International Civil Aviation Organization (ICAO) Category 1 (CAT 1) lateral and vertical navigational accuracy requirements. ADVANCED UNMANNED SEARCH SYSTEM (AUSS) SUPERVISORY COMMAND, CONTROL AND NAVIGATION Final Report
H. B. McCracken Nov. 1992 85 p
(NR Proj. S03-97)
(AD-A263171; NRAD-TR-1533) Avail: CASI HC A05/MF A01

This document summarizes three major facets of Advanced Unmanned Search System (AUSS) vehicle operation. It describes the AUSS vehicle system's four command groups: the basic vehicle mode commands, which alter the vehicle's basic mode of operation; movement commands, which move the vehicle around; search commands, which control the vehicle's search sensors; and informational and miscellaneous commands, which provide information to surface operators. The document details the operation of individual basic vehicle mode, movement, and search commands. The document discusses the two types of AUSS vehicle navigation: dead reckoning and Doppler navigation. It describes the main computer system and the sensor computer group that comprise the AUSS vehicle's basic computer architecture, and it summarizes AUSS vehicle computer system components and their specific functions. USING TODAY'S TECHNOLOGY TO IMPROVE MOBILE C4I FOR THE OPERATIONAL COMMANDER
Robert D. Fox 15 Apr. 1993 45 p
(AD-A263613) Avail: CASI HC A03/MF A01

The rapid development of communications and computer technology in the commercial market provides the Army with a unique opportunity to relook the way we provide command, control, communications, computers, and intelligence (C4I) on the battlefield. Desert Shield/Storm experiences demonstrated the capability and reliability of off-the-shelf equipment and enhancements in battlefield awareness provided by new military systems. However, after action reviews also revealed significant problems for operational commanders during Desert Shield/Desert Storm with command and control 'on the move'. As a result, the Chairman, Joint Chiefs of Staff approved a program called 'C4I for the Warrior'. The thrust of the program is to provide a seamless C4I architecture to support the warfighter. The effort is phased over three periods; Quick Fix Phase (POM years), Mid-Term Phase (POM plus 10), and Objective Phase (beyond Mid-Term period). This study looks a leveraging current technology and new military systems in the Quick Fix and Mid-Term phases to provide a communications and computer workstation for an operational commander's command and control vehicle (C2V). SYSTEM ANALYSIS FOR A KINEMATIC POSITIONING SYSTEM BASED ON THE GLOBAL POSITIONING SYSTEM Final Report
G. J. Geier, Peter V. Loomis, and Alfred Kleusberg Dec. 1992 136 p
(Contract DACW72-89-C-0025)
(AD-A262830; TEC-DRP-92-8) Avail: CASI HC A07/MF A02

This report documents the findings of a study to design a kinematic positioning system to support U.S. Army Corps of Engineers dredging and hydrographic survey operations. Survey quality GPS receivers are considered, due to the accuracy constraints (10 cm vertical positioning). Use of auxiliary sensors (i.e., INS and high quality clocks) is considered to improve navigation performance when GPS is unavailable. Predicted navigation performance indicates that the accuracy requirements can be met, except at the extremes of the expected separation distances from the reference station. The integer ambiguities associated with the carrier phase measurements can generally be resolved within 7 minutes by processing all available satellites. Measurement gaps of roughly 60 seconds can be tolerated without losing the integers when using a high quality INS. DTIC

NEURAL NETWORKS APPLICATION TO DIVERGENCE-BASED PASSIVE RANGING
Yair Barniv Dec. 1992 26 p
(RTOP 505-64-52)
(NASA-TM-103981; A-92198; NAS 1.15:103981) Avail: CASI HC A03/MF A01

The purpose of this report is to summarize the state of knowledge and outline the planned work in divergence-based/neural networks approach to the problem of passive ranging derived from optical flow. Work in this and closely related areas is reviewed in order to provide the necessary background for further developments. New ideas about devising a monocular passive-ranging system are then introduced. It is shown that image-plan divergence is independent of image-plan location with respect to the focus of expansion and of camera maneuvers because it directly measures the object's expansion which, in turn, is related to the time-to-collision. Thus, a divergence-based method has the potential of providing a reliable range complementing other monocular passive-ranging methods which encounter difficulties in image areas close to the focus of expansion. Image-plan divergence can be thought of as some spatial/temporal pattern. A neural network realization was chosen for this task because neural networks have generally performed well in various other pattern recognition applications. The main goal of this work is to teach a neural network to derive the divergence from the imagery. Author (revised)

A COMPARISON OF SIMULATED PARALLAX AND SINGLE-STATION RANGE AIDS TO NAVIGATION

Kevin Laxar, S. M. Luria, and Marc B. Mandler Apr. 1993 59 p
(Contract MIPR-Z51100-9-0002)
(AD-A263460; USCG-D-03-93; NSMRL-1168) Avail: CASI HC A04/MF A01

An appropriately designed parallax (two-station) range allows a mariner to accurately determine a range line--the correct path on which to steer the vessel--at greater distances. Less expensive alternatives to parallax ranges are desirable, and many ideas, principally single-station ranges, have been proposed. However, the mariners' abilities to establish range lines with them have not been measured. The present work has quantified the navigational sensitivity afforded by parallax ranges and three different types of single-station range display systems. The single-station ranges used (1) temporal characteristics, (2) spatial representation, or (3) color changes of the signal to represent changes in lateral position. Range systems were simulated either opto-mechanically or on a high resolution computer display system. The mariners' ability to determine both lateral position in a channel and direction of motion across a channel was assessed psychophysically for each range system. DTIC

ATTITUDE DETERMINATION USING GPS: DEVELOPMENT OF AN ALL SOLID-STATE GUIDANCE, NAVIGATION, AND CONTROL SENSOR FOR AIR AND SPACE VEHICLES BASED ON THE GLOBAL POSITIONING SYSTEM Ph.D. Thesis

Clark Emerson Cohen 1993 203 p
Avail: Univ. Microfilms Order No. DA9309582

The Global Positioning System (GPS) is poised to revolutionize aerospace Guidance, Navigation, and Control. While traditionally thought of as a navigation system, GPS is demonstrated to be a formidable sensor for attitude determination as well. In fact, GPS may now be considered a 10 state sensor, providing continuous real-time Position, Velocity, Time, and Attitude (PVTA) for all axes. Attitude determination is derived from precise (5mm, 1sigma) differential range measurements among multiple GPS antennas mounted on a flight vehicle. Experimental testing on 3m baselines is demonstrated pointing accuracies below 0.1 deg (1sigma) with a usable bandwidth of several tens of Hz. The design and development of a new and unique GPS receiver with full PVTA capability is described. It chronicles the key innovations which made this technology possible and addresses the fundamentals and performance of GPS-based attitude determination. A prototype receiver base on antenna multiplexing is presented which offers prospects of significantly reducing the size, weight, power, and cost of the hardware. Other conceptual designs are presented for achieving the highest possible performance. Methods of resolving the cycle ambiguities of the GPS carrier based on motion are developed and tested in an effort to derive the robustness of attitude determination toward perfection. Maiden space flights of the new receiver are scheduled for launch into low Earth orbit. Test data is presented from extensive flights on a single-engine Piper Dakota to explore aircraft applications of attitude determination. Among these, attitude and precise position sensing using GPS can be applied to the estimation of the aircraft dynamic model in flight. The wealth of dynamic response data obtained through GPS can be used to estimate aircraft stability derivatives and, surprisingly, aeroelastic effects with millimeter-level clarity. This new capability is likely to enhance the overall safety and efficiency of aviation. Dissert. Abstr.

DESIGN AND IMPLEMENTATION OF A GLOBAL POSITIONING SYSTEM (GPS) SUPPORTED AREA NAVIGATION SYSTEM WITH ELECTRONIC AIRCRAFT [ENTWURF UND IMPLEMENTIERUNG EINES GPS-GESTUETZTEN FLAECHENNAVIGATIONSSYSTEMS MIT ELEKTRONISCHER LUFTFAHRTKARTE]

Detlef Stolze 14 Sep. 1992 192 p In GERMAN
(ILR-Mitt-275(1992); ETN-93-94175) Avail: CASI HC A09/MF A02

The development of an area navigation system with GPS (Global Positioning System) based position acquisition is described, with focus on low cost concepts and real time operation. A modular software solution was chosen which can be used on computers with Intel processors. An electronic airchart with a moving map display was selected as man machine interface. A course line computer was used for trajectory points management and for calculation of characteristic magnitudes of area navigation. A modified horizontal situation indicator was used for result representation. ESA

AIRCRAFT GUIDANCE FOR WIND SHEAR AVOIDANCE: DECISION-MAKING UNDER UNCERTAINTY Ph.D. Thesis

Donald Alexander Stratton 1992 220 p
Avail: Univ. Microfilms Order No. DA9306544

Severe low-altitude wind shear poses a significant threat to air transportation safety. Concepts for assisting critical decision making under uncertainty are advanced to promote the avoidance of hazardous weather, particularly microburst wind shear. Computational strategies founded on probability and optimal estimation theories enable flight deck integration of diverse forecasting and detection systems, from airport weather information services to airborne forward-looking wind sensors. A decision-making policy for wind shear is developed from a comprehensive investigation of microburst phenomenology, its observed characteristics, and its effects on aircraft flight. Existing avoidance guidelines for wind shear are extended to exploit the latest available technology, such as Doppler weather radar and lidar. Theories for probability based decision making facilitate real-time computer reasoning with dynamic, conflicting data from a wide array of sources. Bayesian neural networks fused with multivariable estimators account for the limited precision, reliability, and timeliness of correlated sensor measurements. Monte Carlo analyses are conducted to refine a disturbance prediction Kalman filter for forward-looking sensors, with statistical results completing their incorporation into Bayesian reasoning. Symbolic and numerical processes for a Wind Shear Safety Advisor are implemented and evaluated. A risk assessment model based on empirical and analytical results is used to compare the relevance of available wind shear information sources. Simulations of the risk assessment model show its insensitivity to parameter variations. Validations of overall Wind Shear Safety Advisor logic illustrate how it conveys beneficial advance warnings in rapidly developing microburst encounter situations. These results prove that intelligently-integrated detection systems can warn pilots of threatening wind shear sooner, more frequently, and more effectively than isolated systems can. Dissert. Abstr.

DEVELOPMENT AND TESTING OF THE PERSEUS PROOF-OF-CONCEPT AIRCRAFT
John S. Langford 26 Feb. 1993 68 p Prepared in cooperation with National Inst. for Global Environmental Change, Davis, CA

(Contract DE-FC03-90ER-61010)
(DE93-010121; DOE/ER-61010/002; AR-9301) Avail: CASI HC A04/MF A01

Many areas of global climate change research could benefit from a flexible, affordable, and near-term platform that could provide in situ measurements in the upper troposphere and lower stratosphere. To provide such a capability, the Perseus unmanned science research aircraft was proposed in 1989. As a first step toward the development of Perseus, a proof-of-concept (POC) demonstrator was constructed and tested during 1990 and 1991. The POC was a full scale Perseus airframe intended to validate the structural, aerodynamic, and flight control technologies for the Perseus within a total budget of about $1.5 million. Advanced propulsion systems needed for the operational Perseus were not covered in the POC program due to funding limitations. This report documents the design, development, and testing of the Perseus POC. DOE

PRELIMINARY DESIGN OF AN INTERMITTENT SMOKE FLOW VISUALIZATION SYSTEM
Donald T. Ward and James H. Myatt Jun. 1993 65 p
(Grant NAG2-651; RTOP 533-02-35)
(NASA-CR-186027; H-1917; NAS 1.26:186027; TEES-AERO-TR-91-1) Avail: CASI HC A04/MF A01

A prototype intermittent flow visualization system that was designed to study vortex flow field dynamics has been constructed and tested through its ground test phase. It produces discrete pulses of dense white smoke consisting of particles of terephthalic acid by the pulsing action of a fast-acting three-way valve. The trajectories of the smoke pulses can be tracked by a video imaging system without intruding in the flow around in flight. Two methods of pulsing the smoke were examined. The simplest and safest approach is to simply divert the smoke between the two outlet ports on the valve; this approach should be particularly effective if it were desired to inject smoke at two locations during the same test event. The second approach involves closing off one of the outlet ports to momentarily block the flow. The second approach requires careful control of valve dwell times to avoid excessive pressure buildup within the cartridge container. This method also increases the velocity of the smoke injected into the flow. The flow of the smoke has been blocked for periods ranging from 30 to 80 milliseconds, depending on the system volume and the length of time the valve is allowed to remain open between valve closings. Author (revised)

(NASA-CR-193222; NAS 1.26:193222) Avail: CASI HC A03/MF A01

The objective of this research is to develop optimization procedures to provide design trends in high speed prop-rotors. The necessary disciplinary couplings are all considered within a closed loop multilevel decomposition optimization process. The procedures involve the consideration of blade-aeroelastic aerodynamic performance, structural-dynamic design requirements, and acoustics. Further, since the design involves consideration of several different objective functions, multiobjective function formulation techniques are developed. Derived from text

QUIET BY DESIGN: NUMERICAL ACOUSTO-ELASTIC ANALYSIS OF AIRCRAFT STRUCTURES Ph.D. Thesis
Nicolaas Bernardus Roozen 1992 158 p Sponsored by Fokker B.V. Original contains color illustrations
(ISBN-90-386-0042-9; ETN-93-93578) Avail: CASI HC A08/MF A02

The development of feasible analysis methods and models to calculate the dynamic behavior of fuselage and the so called acousto-elastic interaction with its enclosed acoustic cavity, is reported. These methods are to be used in the design optimization of aircraft resulting in considerable noise reduction. The so called structural detuning concept, in which the fuselage structure and propulsion system are designed in such a way that the aircraft resistant frequencies and the propulsion system excitation frequencies are well separated, was applied. The two analysis methods investigated were the continuous analysis (analytical) models and discrete analysis (finite element method) models. ESA

A REAL-TIME, HARDWARE-IN-THE-LOOP SIMULATION OF AN UNMANNED AERIAL RESEARCH VEHICLE Final Report, 1 May 1991 - 28 Aug. 1992
Scott D. Robertson Aug. 1992 65 p
(AF Proj. 2403)
(AD-A262477; WL-TR-93-3005) Avail: CASI HC A04/MF A01

Simulation is a valuable tool for rapidly and cost effectively developing and verifying new systems. This report describes the design and development of a system which simulates an unmanned aircraft and verifies the proper operation of its flight computer. Flight computers, being time critical devices, must execute at a certain rate in order to safely and accurately control an aircraft. In order to verify the proper operation of the flight computer, the simulation must execute in 'real-time', which is a rate of 100 Hz for this flight computer. The flight computer's inputs and outputs are connected to the simulation so that the flight computer thinks it is flying. The simulation architecture is a VME-based computer system, consisting of an input board (designed for this project) which demodulates 13 channels of pulse-width modulated signals, a processor board which executes the simulation software, and a digital-to-analog output board. The existing simulation software was ported to the C language and re-hosted on a 68030 processor board. Additional software was written to handle all the I/O and data conversions. The system accurately simulates the unmanned aircraft, runs in real-time, and verifies the proper operation of the flight computer. DTIC

FLIGHT MECHANICAL MODEL FOR PERFORMANCE CALCULATIONS AND INTERACTIONS BETWEEN FLIGHT VEHICLE AND RAMJET IN REGARD TO THE FLIGHT ORBIT
Frans G. J. Kremer (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Cologne, Germany.) Oct. 1992 93 p Transl. into ENGLISH of Flugmechanikmodel fuer Leistungsrechnungen und Wechselwirkungen zwischen Flugkoerper und Staustrahltriebwerk mit Unterschallverbrennung in bezung zur Flugbahn (Cologne, Germany, DLR), Feb. 1991 p 1-95 Original language document was announced as N91-32131
(ESA-TT-1267; DLR-FB-91-03; ETN-93-93714) Avail: CASI HC A05/MF A02; Original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

A flight mechanics model for performance calculations and relationships between flight vehicle and ramjet engine with subsonic combustion relative to the flight path is described. Performance calculation for a ramjet engine initially required determination of the burst demand throughout the flight path. This is the objective of a flight mechanics computer model. The computer model described is based on the assumption of equilibrium of forces at the center of gravity of the flight vehicle. A further input is an aerodynamic model of the flight vehicle. The flight path is input with a statement of the flight profile, acceleration on flight direction and turning acceleration. The interaction between flight vehicles and ramjet engines in conjunction with the flight path is considered. The influencing variables in the consumption relating to mission phases are described. The role of the angle of incidence and the significance of the design are explained. Interactions are described on the basis of modification of parameters for flight path data (ram pressure, acceleration in flight direction and turning acceleration). ESA

ADVANCED TECHNOLOGY COMPOSITE AIRCRAFT STRUCTURES Monthly Technical Progress Report No. 25, 1-31 May 1991
Larry B. Ilcewicz and Thomas H. Walker 14 Jun. 1991 133 p
(Contract NAS1-18889)
(NASA-CR-190420; NAS 1.26:190420) Avail: CASI HC A07/MF A02

Work performed during the 25th month on NAS1-18889, Advanced Technology Composite Aircraft Structures, is summarized. The main objective of this program is to develop an integrated technology and demonstrate a

confidence level that permits the cost- and weight-effective use of advanced composite materials in primary structures of future aircraft with the emphasis on pressurized fuselages. The period from 1-31 May 1991 is covered.

THE ULTRA LIGHT AIRCRAFT TESTING Final Report
Howard W. Smith 1993 172 p
(Grant NAG1-345)
(NASA-CR-193043; NAS 1.26:193043) Avail: CASI HC A08/MF A02

The final report for grant NAG1-345 is presented. Recently, the bulk of the work that the grant has supported has been in the areas of ride quality and the structural analysis and testing of ultralight aircraft. The ride quality work ended in May 1989. Hence, the papers presented in this final report are concerned with ultralight aircraft. For individual titles, see N93-29775 through N93-29779.

REPORT ON THE TEST SET-UP FOR THE STRUCTURAL TESTING OF THE AIRMASS SUNBURST ULTRALIGHT AIRCRAFT
William Zimmerman and Howard W. Smith *In its* The Ultra Light Aircraft Testing 1993 5 p (For primary document see N93-29774 11-05)
(Grant NAG1-345)
Avail: CASI HC A01/MF A02

This report reviews the test set-up and procedure for the structural testing of the Airmass Sunburst Ultralight Aircraft. In general aviation today, there is a growing need for more stringent design criteria for ultralight aircraft. Unlike most general aviation aircraft, the ultralight lacks sufficient design criteria and more importantly it lacks sufficient certification enforcement. The Airmass Sunburst ultralight that is currently being tested is responsible for over a dozen deaths. It is believed that had there been a more stringent criteria and certification process, this might have been prevented. Our attempt is to show that the failing loads of the aircraft in question are so far below that of the current design criteria, that the laws need to be changed. Author (revised)

LOAD TEST SET-UP FOR THE AIRMASS SUNBURST ULTRA-LIGHT AIRCRAFT
Daniel W. Krug and Howard W. Smith *In its* The Ultra Light Aircraft Testing 1993 41 p (For primary document see N93-29774 11-05)
(Grant NAG1-345)
Avail: CASI HC A03/MF A02

The purpose of this project was to set up, instrument, and test a Sunburst Ultra-Light aircraft. The intentions of the project were that the aircraft would need to be suspended from the test stand, leveled in the stand, the strain gauges tested and wired to the test equipment, and finally, the aircraft would be destroyed to obtain the failing loads. All jobs were completed, except for the destruction of the aircraft. This notebook shows the group's progress as these tasks were completed, and the following section attempts to explain the photographs in the notebook.

NASTRAN ANALYSIS FOR THE AIRMASS SUNBURST MODEL 'C' ULTRALIGHT AIRCRAFT c39
John Verbestel and Howard W. Smith *In its* The Ultra Light Aircraft Testing 1993 32 p (For primary document see N93-29774 11-05)
(Grant NAG1-345)
Avail: CASI HC A03/MF A02

The purpose of this project was to create a three dimensional NASTRAN model of the Airmass Sunburst Ultralight comparable to one made for finite element analysis. A two dimensional sample problem will be calculated by hand and by NASTRAN to make sure that NASTRAN finds similar results. A three dimensional model, similar to the one analyzed by the finite element program, will be run on NASTRAN. A comparison will be done between the NASTRAN results and the finite element program results. This study will deal mainly with the aerodynamic loads on the wing and surrounding support structure at an attack angle of 10 degrees.

CONSTRUCTION, WIND TUNNEL TESTING AND DATA ANALYSIS FOR A 1/5 SCALE ULTRA-LIGHT WING MODEL c02
Michael D. James and Howard W. Smith *In its* The Ultra Light Aircraft Testing 1993 41 p (For primary document see N93-29774 11-05)
(Grant NAG1-345)
Avail: CASI HC A03/MF A02

This report documents the construction, wind tunnel testing, and data analysis of a 1/5 scale ultra-light wing section. Wind tunnel testing provided accurate and meaningful lift, drag, and pitching moment data. This data was processed and graphically presented as follows: C(sub L) vs. gamma; C(sub D) vs. gamma; C(sub M) vs. gamma; and C(sub L) vs. C(sub D). The wing fabric flexure was found to be significant and its possible effects on aerodynamic data was discussed. The fabric flexure is directly related to wing angle of attack and airspeed. Different wing section shapes created by fabric flexure are presented with explanations of the types of pressures that act upon the wing surface. This report provides conclusive aerodynamic data for ultra-light wings. Author (revised)

SELECTION AND STATIC CALIBRATION OF THE MARSH J1678 PRESSURE GAUGE c35
Charles R. Oxendine and Howard W. Smith *In its* The Ultra Light Aircraft Testing 1993 32 p (For primary document see N93-29774 11-05)
(Grant NAG1-345)
Avail: CASI HC A03/MF A02

During the experimental testing of the ultralight, it was determined that a pressure gauge would be required to monitor the simulated flight loads. After analyzing several factors, which are indicated in the discussion section of this report, the Marsh J1678 pressure gauge appeared to be the prominent candidate for the task. However, prior to the final selection, the Marsh pressure gauge was calibrated twice by two different techniques. As a result of the calibration, the Marsh gauge was selected as the appropriate measuring device during the structural testing of the ultralight. Although, there are commerical pressure gauges available on the market that would have proven to be more efficient and accurate. However, in order to obtain these characteristics in a gauge, one has to pay the price on the price tag, and this value is an exponential function of the degree of accuracy efficiency, precision, and many other features that may be designed into the gauge. After analyzing the extent of precision and accuracy that would be required, a more expensive gauge wouldn't have proven to be a financial benefit towards the outcome of the experiment. EFFECT OF DESIGN SELECTION ON RESPONSE SURFACE PERFORMANCE
William C. Carpenter Washington Jun. 1993 181 p
(Grant NAG1-1378; RTOP 505-63-50)
(NASA-CR-4520; NAS 1.26:4520) Avail: CASI HC A09/MF A02

Artificial neural nets and polynomial approximations were used to develop response surfaces for several test problems. Based on the number of functional evaluations required to build the approximations and the number of undetermined parameters associated with the approximations, the performance of the two types of approximations was found to be comparable. A rule of thumb is developed for determining the number of nodes to be used on a hidden layer of an artificial neural net and the number of designs needed to train an approximation is discussed. The flight software developed for the Flight Management/Flight Controls (FM/FC) MicroVAX computer used on the Transport Systems Research Vehicle for Advanced Transport Operating Systems (ATOPS) research is described. The FM/FC software computes navigation position estimates, guidance commands, and those commands issued to the control surfaces to direct the aircraft in flight. Various modes of flight are provided for, ranging from computer assisted manual modes to fully automatic modes including automatic landing. A high-level system overview as well as a description of each software module comprising the system is provided. Digital systems diagrams are included for each major flight control component and selected flight management functions. Author (revised)

STANDARDIZATION OF AUTOMATIC TEST EQUIPMENT IN THE US AIR FORCE Research Report, Aug. 1991 - Apr. 1992
Arthur J. Rooney, Jr. Apr. 1992 31 p
(AD-A262076; NDU-ICAF-92-S79) Avail: CASI HC A03/MF A01

The USAF has failed to standardize automatic test equipment (ATE) used to support aircraft avionics systems. Although the savings from standardization are difficult to estimate, studies indicate the Air Force could save over $200M through standardization of ATE. Aside from the monetary savings, other benefits such as reduced training requirements and provisioning fewer items could be realized through standardization. This paper will focus on three areas. First, we will look at standardization from definition through highlighting the importance of standard ATE. Next, a review of the impediments to achieving commonality of ATE within the Air Force. Finally, an actual example of acquiring common ATE for the Special Operations Forces will be examined. The paper concludes with recommendations to achieve greater commonality of ATE within the Air Force. DTIC

A CONCLUDING STUDY OF THE ALTITUDE DETERMINATION DEFICIENCIES OF THE SERVICE AIRCRAFT INSTRUMENTATION PACKAGE (SAIP) M.S. Thesis
Daniel G. Sergent 25 Mar. 1993 64 p
(AD-A263515) Avail: CASI HC A04/MF A01

Previous research at the Naval Postgraduate School addressed the aerodynamic effects that caused the altitude determination errors in the Service Aircraft Instrumentation Package (SAIP). This thesis builds on the previous work and focused on establishing a correction for the SAIP using both aerodynamic and atmospheric corrections to the Extended Area Test System (EATS) system evaluator program. By using a quadratic function of Mach number to estimate the Cp, the aerodynamic errors can be reduced to enable the SAIP to measure altitude correctly to within 100 ft for velocities up to Mach 0.8. This correction is used to modify the static pressure read by the SAIP. Further flight tests will have to be accomplished to determine the correction for a range of altitudes and aircrafts. The atmospheric errors can be corrected by analyzing the sounding data generated by the Geophysics Department at Pt. Mugu and substituting

actual lapse rate information into the standard altitude equation. This model is shown to predict altitudes to within 200 feet up through 60,000 feet.

A virtual reality flight control system displays to the pilot the image of a scene surrounding a vehicle or pod having six degrees of freedom of acceleration or velocity control by the pilot and traveling through inertial space, the image itself including a superimposed figure providing the pilot an instant reference of orientation consisting of superimposed sets of geometric figures whose relative orientations provide the pilot an instantaneous feel or sense of orientation changes with respect to some fixed coordinate system. They include a first set of geometric figures whose orientations are fixed to the pilot's vehicle and a second set of geometric figures whose orientations are fixed with respect to a fixed or interstellar coordinate system. The first set of figures is a first set of orthogonal great circles about the three orthogonal axes of the flight vehicle or pod and centered at and surrounding the pilot's head, while the second set of figures is a second set of orthogonal great circles about the three orthogonal axes of a fixed or interstellar coordinate system, also centered at and surrounding the pilot's head.

NAVIER-STOKES ANALYSIS OF RADIAL TURBINE ROTOR PERFORMANCE
L. M. Larosiliere Jun. 1993 20 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; sponsored by AIAA, SAE, ASME, and ASEE
(Contract NCC3-208; RTOP 505-62-10)
(NASA-CR-191153; E-7937; NAS 1.26:191153; AIAA Paper 93-2555)
Avail: CASI HC A03/MF A01

An analysis of flow through a radial turbine rotor using the three-dimensional, thin-layer Navier-Stokes code RVC3D is described. The rotor is a solid version of an air-cooled metallic radial turbine having thick trailing edges, shroud clearance, and scalloped-backface clearance. Results are presented at the nominal operating condition using both a zero-clearance model and a model simulating the effects of the shroud and scalloped-backface clearance flows. A comparison with the available test data is made and details of the internal flow physics are discussed, allowing a better understanding of the complex flow distribution within the rotor.

ANALYSIS OF UNSTEADY WAVE PROCESSES IN A ROTATING CHANNEL
L. M. Larosiliere and M. Mawid (Illinois Univ., Chicago.) Jun. 1993 22 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; sponsored by AIAA, SAE, ASME, and ASEE
(Contract NCC3-208; RTOP 505-62-10)
(NASA-CR-191154; E-7939; NAS 1.26:191154; AIAA Paper 93-2527)
Avail: CASI HC A03/MF A01

The impact of passage rotation on the gas dynamic wave processes is analyzed through a numerical simulation of ideal shock-tube flow in a closed rotating-channel. Initial conditions are prescribed by assuming homentropic solid-body rotation. Relevant parameters of the problem such as wheel Mach number, hub-to-tip radius ratio, length-to-tip radius ratio, diaphragm temperature ratio, and diaphragm pressure ratio are varied. The results suggest possible criteria for assessing the consequences of passage rotation on the wave processes, and they may therefore be applicable to pressure-exchange wave rotors. It is shown that for a fixed geometry and initial conditions, the contact interface acquires a distorted three-dimensional time-dependent orientation at non-zero wheel Mach numbers. At a fixed wheel Mach number, the level of distortion depends primarily on the density ratio across the interface as well as the hub-to-tip radius ratio. Rarefaction fronts, shocks, and contact interfaces are observed to propagate faster with increasing wheel Mach number.

(NASA-TM-106230; E-7948; NAS 1.15:106230; AIAA Paper 93-1795)
Avail: CASI HC A03/MF A01

Two 14.4 inch tip diameter rotors were installed and tested in the Small Engines Component Turbine Facility (SECTF) at NASA Lewis Research Center. The rotors, a solid and a cooled version of a radial-inflow turbine, were tested with a 15 vane stat or over a set of rotational speeds ranging from 80 to 120 percent design speed (17,500 to 21,500 rpm). The total-to-total stage pressure ratios ranged from 2.5 to 5.5. The data obtained at the equivalent conditions using the solid version of the rotor are presented with the cooled rotor data. A Reynolds number of 381,000 was maintained for both rotors, whose stages had a design mass flow of 4.0 lbm/sec, a design work level of 59.61 Btu/lbm, and a design efficiency of 87 percent. The results include mass flow data, turbine torque, turbine exit flow angles, stage efficiency, and rotor inlet and exit surveys.

AN ANALYSIS OF THE CORRELATION BETWEEN THE J52 ENGINE COMPONENT IMPROVEMENT PROGRAM AND IMPROVED MAINTENANCE PARAMETERS M.S. Thesis
Leonard B. Gordon Dec. 1992 81 p
(AD-A262062) Avail: CASI HC A05/MF A01

This thesis is a study of the J52 Engine Component Improvement Program (CIP). The objective of the thesis was to determine if the correlation between J52 CIP expenditures and improved maintenance parameters at the component level could be quantified. The major focus of the study revolved around developing a methodology to accomplish the objective using existing databases and open dialogue between the J52 engine manufacturer (Pratt and Whitney), NAVAIRSYSCOM Engine Program Manager, and various NADEP engineers. The methodology evolved using the Fuel Nozzle Support Assembly and was validated using the Fuel Pump. The thesis reached the conclusion that observed improvements in maintenance parameters can be linked to CIP expenditures at the component level.

EFFECTS OF FLOW-PATH VARIATIONS ON INTERNAL REVERSING FLOW IN A TAILPIPE OFFTAKE CONFIGURATION FOR ASTOVL AIRCRAFT

Jack G. McArdle and Barbara S. Esker Jun. 1993 23 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; cosponsored by AIAA, SAE, ASME, and ASEE
(RTOP 505-68-32)
(NASA-TM-106149; E-7643; NAS 1.15:106149; AIAA Paper 93-2438)
Avail: CASI HC A03/MF A01

A one-third-scale model of a generic tailpipe offtake system for an advanced short takeoff, vertical landing (ASTOVL) aircraft was tested at the NASA Lewis Research Center Powered Lift Facility. The basic model consisted of a tailpipe with a center body to form an annulus simulating turbine outflow with no swirl; twin offtake ducts with elbows at the ends to turn the flow to a downward direction; flow control nozzles at the ends of the elbows; and a blind flange at the end of the tailpipe to simulate a closed cruise nozzle. The offtake duct-to-tailpipe diameter ratio was 0.74. Modifications of a generic nature were then made to this basic configuration to measure the effects of flow-path changes on the flow and pressure-loss characteristics. The modifications included adding rounded entrances at the forward edges of the offtake openings, blocking the tailpipe just aft the openings instead of at the cruise nozzle, changing the location of the openings along the tailpipe, removing the center body, and varying the Mach number (flow rate) over a wide range in the tailpipe ahead of the openings by changing the size of the flow control nozzles. The tests were made with unheated air at tailpipe-to-ambient pressure ratios from 1.4 to 5. Results are presented and compared with performance graphs, total-pressure contour plots, paint streak flow visualization photographs, and a flow-angle probe traverse at the offtake entrance.

The evolution of the contact interface and the propagation of compression waves inside a single wave rotor passage gradually opening to and traversing an inlet port is studied numerically using an inviscid formulation of the governing equations. Insights into the response of the interface and kinematics of the flow field to various opening times are given. Since the opening time is inversely proportional to the rotational speed of the rotor, the effects of passage rotation such as centripetal and Coriolis accelerations are intrinsically coupled to the gradual opening process. Certain three-dimensional features associated with the gradual opening process as a result of centripetal and Coriolis accelerations are illustrated. For the range of opening times or rotational speeds considered, a portion of the interface behaves like a vortex sheet that can degenerate into a complex interfacial structure. The vortices produced along the interface can serve as a stirring mechanism to promote local mixing. Coriolis and centripetal accelerations can introduce three dimensional effects such as interfacial distortions in meridional planes and spanwise migration of fluid elements.

A time marching Navier-Stokes code called PARC3D was used to study the 3-D viscous flow associated with an advanced ducted propeller (ADP) subsonic inlet at take-off operating conditions. At a free stream Mach number of 0.2, experimental data for the inlet-with-propeller test model indicated that the airflow was attached on the cowl windward lip at an angle of attack of 25 degrees became unstable at 29 degrees, and separated at 30 degrees. An experimental study with a similar inlet and with no propeller (through-flow) indicated that flow separation occurred at an angle of attack a few degrees below the value observed when the inlet was tested with the propeller. This tends to indicate that the propeller exerts a favorable effect on the inlet performance. During the through-flow experiment a stationary blockage device was used to successfully simulate the propeller effect on the inlet flow field at angles of attack. In the present numerical study, this flow blockage was modeled via a PARC3D computational boundary condition (BC) called the screen BC. The principle formulation of this BC was based on the one-and-half dimension actuator disk theory. This screen BC was applied at the inlet propeller face station of the computational grid. Numerical results were obtained with and without the screen BC. The application of the screen BC in this numerical study provided results which are similar to the results of past experimental efforts in which either the blockage device or the propeller was used.

HEAT TRANSFER AND COOLING IN GAS TURBINES [LE TRANSFERT THERMIQUE ET LE REFROIDISSEMENT DANS LES TURBINES A GAZ]

Feb. 1993 492 p 80th Symposium held in Antalya, Turkey, 12-16 Oct. 1992
(AGARD-CP-527; ISBN-92-835-0701-0) Copyright Avail: CASI HC A21/MF A04

The symposium was arranged in the following sessions: turbine blades--external heat transfer; turbine blades--internal heat transfer; measurement techniques; rotating disks, labyrinth seals, and shafts; combustors; design, interactions; and prediction methods. Heat transfer and cooling in gas turbines are still key factors for achieving high performance, increased life, and improved reliability. Any progress in this field will lead to a reduction of maintenance cost and fuel consumption. The purpose of the symposium was to bring together experts from industry, research establishments, and universities to discuss fundamental and applied heat transfer problems relevant to gas turbines, to exchange practical experience gained, and to review the state of the art. For individual titles, see N93-29927 through N93-29964.

A theory for unsteady, multimode transition on gas turbine airfoils is presented. The theory, which provides a correction to the Mayle-Dullenkopf multimode model, considers a more physically correct viewpoint by taking into account the periodic disturbance caused by both the wake-induced turbulent strips and the 'becalmed' flow following them. In addition, a comparison of the theory with data is provided, which shows excellent agreement, and results illustrating the effects of transition onset distance and wake-passing Strouhal number on multimode transition are presented.

In HP turbines, predictions of the heat transfer to the blade and endwalls is particularly important for an accurate assessment of turbine component life. On the endwalls, there are often complex 3D (secondary) flows present which make predictions of heat transfer particularly difficult. A detailed investigation of this area has been carried out on a fully annular cascade of highly 3D nozzle guide vanes. Measurements were made on the vane and endwalls to determine heat transfer and aerodynamic characteristics. Testing was conducted in a short duration Isentropic Light Piston Test Facility, at engine representative Reynolds number, Mach number, and gas-to-wall temperature ratio. Interpreted test data are compared with computations obtained at test conditions. Author (revised)

Results of naphthalene sublimation measurements and flow visualization studies near the base of round and a square cylinder mounted on a flat plate are compared with similar measurements in the endwall region of a turbine blade. Differences and similarities of the flow and mass transfer are discussed. Samples of mass transfer distribution and visualization results in the region are provided. Supported by the sublimation and the flow visualization results models for the vortex structure in the flow are suggested. Derived from text

THERMAL EFFECTS OF A COOLANT FILM ALONG THE SUCTION SIDE OF A HIGH PRESSURE TURBINE NOZZLE GUIDE VANE

T. Arts and I. Lapidus (Societe Nationale d'Etude et de Construction de Moteurs d'Aviation, Villaroche, France.) *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 8 p Sponsored in part by SNECMA (For primary document see N93-29926 11-07)

Copyright Avail: CASI HC A02/MF A04

The purpose is to try to describe some of the influences on external convective heat transfer of a coolant film whose position varies along the suction side of a high pressure turbine nozzle guide vane. The measurements were performed in the short duration Isentropic Light Piston Compression Tube Facility CT-2 of the von Karman Institute. The effects of external and internal flow are considered in terms of Mach number, Reynolds number, freestream turbulence intensity, blowing rate, and coolant to freestream temperature ratio. The way to evaluate those results in terms of heat transfer coefficient is finally discussed. Author (revised)

EXPERIMENTAL STUDY OF HEAT TRANSFER CLOSE TO A PLANE WALL HEATED IN THE PRESENCE OF MULTIPLE INJECTIONS (SUBSONIC FLOW) [ETUDE EXPERIMENTALE DU TRANSFERT DE CHALEUR PRES D'UNE PAROI PLANE CHAUFFEE EN PRESENCE D'INJECTIONS MULTIPLES (ECOULEMENT SUBSONIQUE)]

E. Foucault, P. Deniboire, J.-L. Bousgarbies, J.-J. Vullierme, and E. Dorignac *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 10 p In FRENCH (For primary document see N93-29926 11-07)

Copyright Avail: CASI HC A02/MF A04

The results of a detailed experimental study of the aerodynamic and thermic fields within the boundary layer of a plane wall heated in the presence of localized injections of hot air are presented. For two values of the ratio of jet speed/main flow (0.6 and 1.6) the three components of the flight path vector and the local temperature of the flow are measured in many positions, respectively by Doppler laser anemometry using a cold probe wire. A map of the temperature of the plane wall is obtained by means of an infrared camera. The results show the strongly 3D aspect of the flow downstream from the jet which is dominated by the presence of swirling structures. These last areas generate strong rates of turbulence and have a great influence on the temperature field in the wake of the jets. For the largest of the two speed ratios considered, the cross-flow penetrates under the jets downstream from the injection openings and thus, is in opposition to the heat transfer. Author (revised)

THE INFLUENCE OF NON-UNIFORM SPANWISE INLET TEMPERATURE ON TURBINE ROTOR HEAT TRANSFER

G. R. Guenette, G. Pappas, and A. H. Epstein *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 10 p Sponsored in part by Rolls-Royce, Inc. (For primary document see N93-29926 11-07)

Copyright Avail: CASI HC A02/MF A04

The influence of a spanwise varying, circumferentially uniform inlet total temperature distortion was measured on a transonic turbine stage in a short duration turbine test facility. Large levels of distortion were found to increase rotor blade heat transfer, especially on the pressure surface. A three-dimensional, steady, multi-blade row, Euler code and a streamline curvature calculation were used to interpret the data but did not account for all of the heat transfer increase observed. DETERMINATION OF SURFACE HEAT TRANSFER AND FILM COOLING EFFECTIVENESS IN UNSTEADY WAKE FLOW CONDITIONS

M. Sautner, S. Clouser, and J. C. Han (Texas A&M Univ., College Station.) *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 12 p (For primary document see N93-29926 11-07)

Copyright Avail: CASI HC A03/MF A04

The effect of unsteady wake flows on blade heat transfer and film cooling effectiveness was experimentally determined by using a spoked-wheel type wake generator. The experiments were performed with a five airfoil linear cascade at the Texas A&M University low speed wind tunnel facility. The mainstream Reynolds number based on airfoil chord length was about 3 x 10 exp 5. The wake Strouhal number was varied between 0 and 0.4 by changing the rotating wake passing frequency. A hot wire anemometer system was located at the cascade inlet to detect the instantaneous velocity, phase-averaged mean velocity, and turbulence intensity induced by the passing wake. A pressure tap instrumented blade was used to measure the surface static pressure distributions and compared well with predicted velocity distributions in the cascade. An instrumented blade without film holes equipped with a thin foil thermocouple was used to determine the surface heat transfer coefficient distributions. The results show that the periodically passing wake promotes earlier boundary layer transition, causing much higher heat transfer on the suction surface. The passing wake also significantly enhances the heat transfer on the pressure surface. The other thin foil thermocouple instrumented blade contained several rows of film cooling holes at the stagnation region and on both the suction and pressure surfaces, and was employed to determine the film cooling effectiveness distributions. The results show that the strong passing wake interacts with the film layer and causes a relatively lower film effectiveness on both the suction and pressure surfaces for all three blowing ratios studied (M = 0.4, 0.8, and 1.2). Measurements have been made of instantaneous heat-transfer rates to a flat-plate surface under a transitional boundary layer. The thin-film surface instrumentation used in the study was capable of time-resolving the effects of changes in the heat-transfer rate within an accuracy of 10 microseconds. The tests were conducted in the Oxford University 6 inch Isentropic Light-Piston Tunnel (ILPT) under simulated gas turbine Reynolds numbers, Mach numbers, gas-to-wall temperature ratios, and pressure gradients. The ability to observe and track the end stage of the transition process (i.e., turbulent spots) in a laminar boundary layer undergoing transition allowed turbulent-spot convection speeds and spreading angles to be estimated. In these tests, the important fluid-dynamic parameters of Mach number, Reynolds number, and streamwise pressure gradient were varied independently over a wide range of values characteristic of those encountered in the turbine environment. Using quantitative values of the measured turbulent-spot characteristics, a simple time-marching code was developed based on Emmons' turbulent-spot theory to estimate the intermittency. The accurate prediction of turbine heat transfer remains beyond our current capabilities. To investigate this condition, nonconventional turbulence generation techniques have been employed to explore the impact of high turbulence or unsteadiness on heat transfer. The heat transfer from a 2D planar wall jet is compared with an axisymmetric wall jet with twice the turbulence scale and more turbulent kinetic energy - with an increased heat transfer shown by the planar configuration. The resulting comparisons of wall jet augmented heat transfer to engine turbine blade heat transfer is quite favorable. Derived from text

Turbulence in turbine flows of gas turbine engines is generally inhomogeneous and is also characterized by wide ranges of intensity and scale. The interaction between Free Stream Turbulence (FST) and boundary layer turbulence (BLT) is complicated in all but the case of low values of both intensity and scale. In a recent investigation, an attempt was made to establish the effect of homogeneous FST on wall friction (when there is no heat transfer) in the relatively simple case of a flat plate, zero pressure gradient boundary layer. In the current paper, the method was extended for the prediction of heat transfer in the same flow field. In any problem involving heat and momentum transport, it is common to introduce some type of similarity between the two transport processes. The current method is based on the application of a similarity rule governing the spectra of turbulence intensity and temperature variance. The principal outcome is a method of establishing heat transfer in a given flow field for which experimental data are available under cold flow conditions and have been verified with the model prediction scheme. This paper presents the results of an experimental program aimed at investigating the effect of Coriolis forces and centripetal buoyancy on forced convection in an internally finned circular tube which rotates about an axis orthogonal to the tube's central axis. This geometric arrangement typifies the internal coolant channels of gas turbine rotor blades. It is demonstrated that, as with smooth-walled tubes, Coriolis-driven secondary flows give rise to relatively better heat transfer on the trailing edge of the tube compared with that on the leading edge. Leading edge heat transfer is shown to be significantly impaired in relation to that which occurs under non-rotating conditions. Centripetal buoyancy is shown to improve local heat transfer on the leading and trailing edges for a given value of the through flow Reynolds number and the Rossby number. Although duct rotation tends to improve heat transfer on the trailing edge in comparison with normal stationary duct forced convection, serious overprediction of heat transfer results from ignoring rotational effects on the leading edge. This is an important observation in the context of the design of turbine rotor blade cooling systems. Author (revised)

The paper brings together recent research at UMIST directed at the prediction of flow through tight, square sectioned U-bends rotating in orthogonal mode. The cases of flow through rotating straight ducts and stationary U-bends are considered first to allow comparison with experimental data; finally, having demonstrated the level of accord achieved with experiment, predictions for the rotating U-bend are provided. A fairly simple turbulence model was adopted with the usual high Reynolds number k-epsilon model being interfaced with a 1-equation near-wall model. To achieve, in the case of the U-bend, grid independent behavior with the available computer core, a bounded third-order discretization of convective transport had to be applied to all dependent variables. The agreement with the available experimental data is broadly satisfactory in the case of the rotating straight duct (the substantial modifications to the Nusselt number on the pressure and suction faces of the duct due to Coriolis and buoyant forces being well reproduced. Agreement is less complete in the case of the U-bend but even so, the predicted levels of Nusselt number and the distribution of velocity downstream of the bend are broadly in line with experiment. The results point to the desirability of incorporating second-moment closure into the bend-flow calculations as models of this type have a track record of capturing the sensitivity of the turbulent stresses to complex strains better than the eddy viscosity model adopted here. COOLING GEOMETRY OPTIMIZATION USING LIQUID CRYSTAL TECHNIQUE

G. Lodigiani, A. Trovati, L. Paci, and P. Pirrelli (Elasis S.C.p.A., Brindisi, Italy.) *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 12 p (For primary document see N93-29926 11-07)

Copyright Avail: CASI HC A03/MF A04

Experimental results concerning the cooling performance of jet engine blading internal passages are presented. Use was made of the Liquid Crystal Transient Technique in order to obtain detailed information about heat transfer coefficients on the internal blade surfaces in presence of turbulence promoters. A peculiar behavior of the cooling channels with turbulators was detected, which reduces the expected heat transfer effectiveness. Heat transfer experimental results, reproducing actual engine operating conditions, were employed to predict the blade metal temperature: cooling flow parameters and internal channel characteristics were therefore tuned in order to attain a suitable metal temperature distribution, and to optimize the cooling effectiveness. The outcome of experimental and calculation work was then compared to the engine test blade surface temperature distribution, obtained by means of thermal paints. The comparison showed fairly good agreement, demonstrating once more the usefulness of the Liquid Crystal Transient Technique in allowing designers to improve present blade cooling devices. Measurements were made of the local heat transfer at the surface of a flat plate underneath a confined impinging jet. Thermochromic liquid crystals were used to measure the surface temperature of a uniformly heated plate cooled by an impinging jet. The temperature of the wall through which the jet passes was controlled, and experiments were performed to measure the two heat transfer coefficients which arise from this three temperature problem. The effect of Reynolds number and plate to jet spacing on heat transfer was investigated. The heat transfer results are discussed in terms of the interpreted flow field. Author (revised)

PREDICTION OF JET IMPINGEMENT COOLING SCHEME CHARACTERISTICS (AIRFOIL LEADING EDGE APPLICATION) **c34**
A. Riahi, H. J. Saabas, and W. Abdel Messeh *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 14 p (For primary document see N93-29926 11-07)
Copyright Avail: CASI HC A03/MF A04

A control volume, finite difference method based on the work of Rhie in conjunction with a high Reynolds k-epsilon model and a two layer turbulence model was used to predict the heat transfer coefficients underneath an impinging circular jet in the absence of cross flow. The numerical results are compared to experimental measurements for two different impingement height to jet diameter ratios: H/D = 2, and H/D = 10. The comparisons indicate that, although both the k-epsilon and the two layer turbulence models are adequate in the prediction of the flow field, the two layer model resulted in heat transfer predictions that were closer to experimental observations. It was also observed that the predicted heat transfer coefficients for the case of H/D = 2 were sensitive to the assumed jet exit turbulence levels, whereas they were not for H/D = 10. This information is useful to the designer of cooled turbine components. Author (revised)

An overview and summary of test methods and results are given for the problem of measuring local heat transfer on rotating surfaces that model gas turbine engine disks. Disk cavity situations generically similar to those encountered in the high pressure stage disk cooling are considered, with cooling air supplied both at or near the wheel centerline as well as through single or multiple jets impinging outboard on the wheel near the blade attachment region. In some situations provision has been made for ingestion into the disk-cavity from the gas path region radially outboard of the disk. Local heat transfer rates in all cases are determined from the color display from a thin coating of encapsulated liquid crystals sprayed onto the disk, in conjunction with use of a video camera and computer vision system. For cases with axisymmetric disk surfaces, the coated surfaces are illuminated and viewed continuously, and detailed radial distributions of local Nusselt number are obtained. For non-axisymmetric disk surfaces, such as encountered in the vicinity of bolt heads, the disk is illuminated with stroboscopic light, and a method has been developed and used to synchronize the computer frame grabber with the illumination. THE SWOLLEN POLYMER TECHNIQUE AND ITS USE FOR HEAT TRANSFER INVESTIGATIONS ON FILM COOLED SURFACES **c34**
N. Hay, D. Lampard, and N. MacLeod (Edinburgh Univ., Scotland.) *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 21 p (For primary document see N93-29926 11-07)
Copyright Avail: CASI HC A03/MF A04

The Swollen Polymer Technique is a mass transfer analogy method for obtaining heat transfer data. It is similar in principle to the naphthalene method, but it has an advantage in that it can be combined with interferometric measuring methods giving a panoramic view of the distribution of the transfer coefficient over the working surface. Additionally, the mass transfer process is reversible, and the working surface can be used repeatedly. Changes in thickness of a polymer coating on the working surface, initially swollen with an ester, are measured, using holographic interferometry to yield a fringe pattern depicting loci of equal transfer coefficient over the surface. The paper describes the basis of the method, the equipment required to implement it, the precautions necessary for its successful use, its advantages, its limitations, and its future potential. The technique yields data useful in the design process. Examples of its application to film cooled surfaces are given, including the effects of geometry, density ratio, and acceleration of the mainstream flow on the heat transfer coefficient. Extension of the technique for the simultaneous measurement of effectiveness and heat transfer coefficient is described, and its further extension for use with curved surfaces is outlined. A recent development to the technique itself by the use of a thermoplastic plate for recording the holograms opens up the possibility of further advancement using electronic image processing. The Advanced Turbine Aerothermal Research Rig (ATARR) has been under development and construction at Wright-Patterson Air Force Base for the past three years. Construction of the facility is now complete and demonstration experiments are underway. These demonstration experiments involve use of an instrumented turbine stage (both surface pressure and surface heat flux instrumentation) to obtain measurements for comparison with predictions, flow path measurement of total pressure, total temperature, and static pressure to determine flow path uniformity, as well as instrumentation to ascertain proper operation of all facility components. At the time of this writing, the experiments designed to obtain the data just mentioned are underway but results are not available. Therefore, the written paper will be confined to a description of: (1) the facility and its design capabilities, (2) a description of the operation of the major components with limited supporting data, e.g., main valve opening and closing times, and (3) a brief description of an uncertainty analysis that has been completed for the instrumentation and aero-performance measurements. Heat transfer measurements were made in a five-cavity compressor drum rig, in which cooling air passed axially through the center of the discs. The rig also contained a central drive shaft which could be either co- or contrarotated. Tests were conducted for different mass flow rates, rotational speeds and air temperatures. Typical engine conditions for steady state and transient operating conditions were simulated. Local Nusselt numbers were obtained for the discs of one cavity and compared with other published results. Furthermore an investigation into the effect of co- and contrarotating shaft on the surface temperatures of the discs and on the Nusselt number distribution was also carried out. It was found that the direction of rotation and speed of the shaft influenced the disc temperatures as well as the Nusselt numbers. Author

The operating temperatures of turboshaft engines oblige the manufacturers to cool the parts of the engine located downstream from the combustion chamber and in particular the turbines. Knowledge of the air flow in the air ventilation paths is essential to optimize the cooling of the engines. In order to precisely determine the phenomena of heat exchanges and the aerodynamic forces on the walls of complex cavities, SNECMA uses the MATHILDA code developed with ONERA. The MATHILDA code solves the three dimensional Navier-Stokes equations for flows of compressible fluid. The equations are treated using a finite volume method accomplished on a mesh structure. The resolution scheme is decentered by the order of 2. An implicit method of the ADI type makes it possible to stabilize and accelerate the calculation. This article presents the work of the validation of the MATHILDA code for applications to the flows in interdisc cavities. The cases presented were studied by the implementation of the axisymmetric two-dimensional version. Two types of experimental cavities served as the validations, rotor/stator cavities and rotor/rotor cavities. The solutions obtained, compared with the experimental measurements, are satisfactory, from an aerodynamic point of view and a thermal point of view. The last calculation, on a real configuration of the internal cavity of the engine, makes it possible to apprehend the difficulties encountered in the implementation of this type of modeling, and to measure the contribution of the code solving the Navier-Stokes equations to the description of the cooling flows. The flow regimes in rotating cavities (modelling corotating disks or rotor-stator systems), with or without through flow, are studied by numerical approach using different techniques: spectral and finite volume methods. Comparisons between these techniques have been carried out for a typical test case. The solutions have been also compared satisfactorily to asymptotical approximations and to experimental results. The computations with spectral methods have been carried out until the onset of unsteady instabilities and transition to turbulence. The turbulent regimes have been treated with the finite volume method based on modelling derived from a k-epsilon or algebraic model of second order. Author (revised)

The thermal behavior of discs and casings in gas turbine engines has important effects on engine performance and integrity and theoretical or computer modelling of these effects is an essential part of the design process. In this paper the current status of thermal modelling is reviewed, problem areas are identified, examples of where application of the latest numerical and modelling techniques have led to improvements are given, and prospects for further developments are discussed. It is concluded that, although recent research and computing advances are improving the predictive capability, considerable scope for further improvement remains. Author

The paper provides both a brief review of some recent research into the flow and heat transfer associated with the turbine and compressor discs of gas turbine engines and some new results for flow between contra-rotating turbine discs. Elliptic solvers, parabolic solvers and integral methods have all been applied successfully to some important axisymmetric boundary-layer-dominated flows, and multigrid elliptic solvers used in conjunction with parallel computers offer great promise for the future computation of nonaxisymmetric flows. LDA velocity measurements and computations have given fresh insight into the flow between contra-rotating turbine discs. Batchelor-type flow, in which there are boundary layers on the discs and a shear layer in the midplane, has been computed for laminar flow but has not been observed in practice, even at local rotational Reynolds numbers as low as 2.2 x 10(exp 4). The actual flow structure comprised radial outflow in boundary layers on the discs and a central core of radial inflow in which rotational effects were weak. Although the flow in the core was always turbulent, the flow in the boundary layers was laminar for rotational Reynolds numbers up to at least 1.2 x 10(exp 5). Agreement between the computed turbulent velocities and the measured values was good for Reynolds numbers above 4.5 x 10(exp 5). Author (revised)

A new experimental and numerical research program was conducted to determine the effects of rotation on the leakage loss and the heat transfer coefficients of compressible flows in modern high performance labyrinth seals. In this study, the interest is focused on divergent shaped stepped labyrinth seals. That type of labyrinth seal is the last one within a row of different labyrinth seals, investigated at the University of Karlsruhe: straight-through, staggered labyrinth seals and convergent shaped stepped labyrinth seals have been the other geometries. For heat transfer and leakage loss measurements our high temperature test facility was used, providing realistic conditions of gas temperatures, pressure ratios as well as a wide range of axial and peripheral Reynolds numbers. In addition, numerical codes have been verified by experimentally obtained data. Heat transfer coefficients for the stator and the rotor are derived utilizing the well-known standard k-epsilon model and the Stanton-analogy. This report discusses some new rotational effects, which are significant for the divergent shaped seal. In addition, these results are compared with those obtained from our other seal geometries studied. Author (revised)

FLUID FLOW AND HEAT TRANSFER IN THE ENTRANCE REGION OF AN ANNULUS BETWEEN INDEPENDENTLY ROTATING TUBES WITH A TURBULENT AXIAL FLOW c34

H. Pfitzer, T. Rothe, and H. Beer *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 11 p (For primary document see N93-29926 11-07)
Copyright Avail: CASI HC A03/MF A04

Experimental and numerical investigations of turbulent flow and heat transfer have been performed in the entrance region of a concentric annulus between independently rotating tubes. The horizontally mounted test section has an electrically heated outer wall and an adiabatic inner wall. The mean heat transfer rate in the hydrodynamic and thermal entrance region as well as the local Nusselt number at the axial position z/db(sub h) approx. = 60, which is the end of the rotating annular channel, were determined experimentally. Hotwire and thermocouple probes allowed for measurement of velocity and temperature distributions at the end of the annulus. Numerical predictions, applying a k-epsilon eddy viscosity model with a modification by the flux Richardson number, are compared with the experimental results. The comparison shows that general effects of the rotation can be predicted quite well with the aid of a simple turbulence model. Due to stabilizing or destabilizing effects of centrifugal forces in the fluid and due to the additional shear stress, the rotation of the inner and the outer tube influences remarkably fluid flow and heat transfer in the annulus. THE EFFECT OF MAIN STREAM FLOW ANGLE ON FLAME TUBE FILM COOLING c34
H. Klinger and D. K. Hennecke *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 12 p Sponsored in part by BMFT (For primary document see N93-29926 11-07)
Copyright Avail: CASI HC A03/MF A04

Generally film cooling configurations are positioned such that they are oriented perpendicular to the main stream flow direction. However in many cases, in particular combustor applications, different flow angles may occur. Then, due to the interaction between the main stream and the cooling film, a complex three-dimensional flow field with a vortex is formed. An experimental study was done to study the basic effects. The cooling configuration was a vertical slot which could be turned by up to about 60 degrees from the position perpendicular to the main stream. Velocity distributions were measured and the adiabatic film cooling effectiveness was determined using the liquid crystal technique. The results show that, along lines parallel to the slot, the film cooling effectiveness varies strongly, even with small slot turning angles. This would lead to hot and cold spots in a combustor application. A simple semi-empirical correlation for the average cooling effectiveness is derived using the main stream velocity component perpendicular to the slot. Author

Impingement/effusion cooling offers one of the most effective ways of cooling gas turbine combustor walls and turbine blades. The design principles are reviewed and cooling effectiveness data presented for a range of typical geometries with holes at 90 degrees to the surface. The main variable studied was the number of impingement/effusion holes. Comparison was made with the effusion cooling effectiveness. Optimum configurations were demonstrated with a 0.7 overall cooling effectiveness at a mass flow per unit surface area of 0.2 kg/sm(exp 2)bar. This was equivalent to 10 percent of the combustor air flow for a typical gas turbine combustor. Data is also presented for the overall wall heat transfer coefficient. The mechanism of the enhanced heat transfer within the impingement/effusion double skin wall was investigated using a CFD code. This predicted the complex aerodynamics in the impingement gap and also gave good agreement with the measured overall heat transfer data. Author (revised)

EVALUATION OF MULTI-DIMENSIONAL FLUX MODELS FOR RADIATIVE TRANSFER IN CYLINDRICAL COMBUSTION CHAMBERS c34
Nevin Selcuk *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 6 p (For primary document see N93-29926 11-07)
Copyright Avail: CASI HC A02/MF A04

Four flux-type models for radiative heat transfer in cylindrical configurations were applied to the prediction of radiative flux density and source term of a cylindrical enclosure problem based on data reported previously on a pilot-scale experimental combustor with steep temperature gradients. The models, which are Schuster-Hamaker type four-flux model derived by Lockwood and Spalding, two Schuster-Schwarzschild type four-flux models derived by Siddall and Selcuk and Richter and Quack and spherical harmonics approximation, were evaluated from the viewpoint of predictive accuracy by comparing their predictions with exact solutions produced previously. The comparisons showed that spherical harmonics approximation produces more accurate results than the other models with respect to the radiative energy source term and that the four-flux models of Lockwood and Spalding and Siddall and Selcuk for isotropic radiation field are more accurate with respect to the prediction of radiative flux density to the side wall. The progress which was recently achieved in the modeling of turbulent combustion for applications to propulsion are described. The averaged equations of reactive turbulent flows are given, then the Probabilist EUlerian Langrangian model (PEUL) intended for the calculation of the average source terms of categories and of enthalpy are presented. The possibility of taking into account by this model the reactional mechanisms to several categories is applied to the prediction of the pollutants and in particular to the calculation of thermal NO. In order to obtain the best possible prediction of the chemical composition and the temperature, three total mechanisms of oxidation of methane are successively coupled with the PEUL model and their results compared. Two applications are then studied. The first application is a premixed flame stabilized by a hot gas flow. The computation results are compared with the experimental results obtained with ONERA and present a suitable agreement, in particular with regard to the profiles of thermal NO. The second concerns a portion of an annular aeronautical chamber. The comparison of the average production rates obtained with a model of turbulent combustion with rapid chemistry and with the PEUL model highlights, in this case, the importance of not making the hypothesis of rapid chemistry. AERO-THERMAL DESIGN OF A COOLED TRANSONIC NGV AND COMPARISON WITH EXPERIMENTAL RESULTS
S. Colantuoni, A. Colella, L. DiNola, D. Carbone, and D. Marotta *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 25 p (For primary document see N93-29926 11-07)
Copyright Avail: CASI HC A03/MF A04

The aerothermal design process applied to a Nozzle Guide Vane of a gas-generator axial-flow turbine for a compact advanced technology core engine is described. The principal characteristics of the NGV are: Overall Tip Radius, 108.8 mm; Blade height, 19.7 mm; Blade aspect ratio, 0.53; Solidity, 1.37; Mean Exit isentropic Mach Number, 0.95; Inlet Temperature, 1450K. The NGV is cooled by a combination of different solutions, like impingement cooling and film-cooling on the front side, and forced convection on the rear side, followed by a cooling ejection at pressure side near the trailing edge. Representative results of the computational fluid-dynamics and of the thermal analysis of the NGV blade, together with some experimental data obtained from component test rig and engine demonstrator are presented and discussed. Air ejection for film-cooling affects the aerodynamic behavior of the blading by the mixing of the coolant with the mainstream as well as by the interaction between the jet and the boundary layer. The main objective is to receive more information on the flow field in the leading edge region. The focus is the aerodynamic behavior of ejection in the stagnation region. A Navier-Stokes code was used to evaluate the flow field considering the ejection. The calculated results are compared with experimental investigations. Cold gas experiments were conducted in a cascade wind tunnel on three large scaled turbine blades with slotted leading edges. The mass flux ratio was varied from 0.0 to 2.5 to simulate film cooling effects. A high resolution of the flow field especially close to the wall (nearest distance: 50 microns) was achieved by Laser-2-Focus measurements. The pressure distributions on the blade surface and in the wake were measured in order to determine the overall behavior of the blades quantitatively while oil flow patterns and Schlieren pictures provide qualitative results. The experimental results show that the strong pressure gradient near the stagnation point affects the velocity distribution of the jets. This non-uniformity produces additional aerodynamic losses. To take these effects into account for the Navier-Stokes calculation a multi-block grid was used to model the flow field in the ejection holes and in the mainstream. Thus, the experimental and numerical results show a good agreement. Author (revised)

Different aerodynamic aspects of the flow field generated when a single jet or a row of jets are ejected into a mainstream are experimentally investigated. The similarity parameters are taken such as to match those of the three-dimensional film cooling. The objective is to deepen the understanding of the complex phenomena associated with these flows, and to provide a comprehensible and detailed data base for validation of numerical codes. To be able to obtain high resolution measurements, the study is made on large scale models. The scale enlargement obliges to use moderate velocities, so that the Reynolds number can be kept within realistic limits and the similarity preserved. The use of low air speeds prevents the analysis of compressibility effects. This restriction is not as severe as one can think because, according to the related bibliography, these effects start to be noticeable at Mach numbers higher than 0.8, while the designers avoid to inject the coolant in the vicinity of shock waves to avoid boundary layer separation. The study is made on three different models installed in a low speed wind tunnel. A first model consists of a flat plate with a single inclined circular hole. The isolated jet/mainstream interaction is investigated by means of this first test plate. The other two models present the same configuration as the first but having now a row of holes with different pitch to diameter ratios in each case. These models are useful to understand the interaction between jets and to analyze the formation and development of the coolant layer. Author (revised)

MODELING OF A TURBULENT FLOW IN THE PRESENCE OF DISCRETE PARIETAL COOLING JETS [MODELISATION D'UN ECOULEMENT TURBULENT EN PRESENCE DE JETS PARIETAUX DISCRETS DE REFROIDISSEMENT]

J. M. Maurice, F. Leboeuf, and P. Kulisa *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 13 p In FRENCH (For primary document see N93-29926 11-07)

Copyright Avail: CASI HC A03/MF A04

The high temperature level reached in the first turbine stages requires efficient blade cooling. Film cooling has proved its ability to protect the wall from the hot upstream flow. However, the jets strongly disturb the aerodynamic flow characteristics. As a consequence, the main objective of the designers is to get the best compromise between thermal strains and aerodynamic losses. A two-dimensional viscous flow model, with discrete jets and based on a boundary layer concept, was developed at Ecole Centrale de Lyon. The turbulence closure was first performed by a mixing length model. A low Reynolds number version of a k-epsilon model is presented. A space averaging method in the transverse direction is used; thereby the two-dimensional character of the computation is preserved, while the specific effects of the discrete jets are taking into account in the model. Comparisons with experimental results are given in the case of a row of jets, as injected through a turbulent boundary layer on a flat plate, near the injection orifice. Author (revised)

COUPLING OF 3D-NAVIER-STOKES EXTERNAL FLOW CALCULATIONS AND INTERNAL 3D-HEAT CONDUCTION CALCULATIONS FOR COOLED TURBINE BLADES

A. Heselhaus, D. T. Vogel, and H. Krain *In* AGARD, Heat Transfer and Cooling in Gas Turbines Feb. 1993 9 p (For primary document see N93-29926 11-07)

Copyright Avail: CASI HC A02/MF A04

The problem of cooled gas turbine blades is theoretically investigated. The presented code solves the 3D-Reynolds averaged-Navier-Stokes equations for the external passage flow and the 3D-heat conduction equation for the interior of the blade. Both calculation schemes are coupled without any modeling of the heat transfer boundary conditions at the blade surface. Calculations are presented for a thin hollow flat plate and a typical guide vane blade with a simple cooling channel configuration. Both geometries are cooled by prescribing fixed heat transfer boundary conditions at the inner boundaries. Additionally numerical results are compared to analytical data. The agreement is quite satisfactory. Author (revised)

The numerical simulation of transonic flows through film-cooled turbine cascades is described. The modelization of coolant injection was implemented in a computational code which solves either the laminar or the Reynolds-averaged Navier-Stokes equations in cascades. Turbulence effects are accounted for by means of the eddy viscosity concept. Two turbulence models were implemented in the code. The first is the Baldwin-Lomax algebraic model and the second is the two-equation k-omega model proposed by Wilcox. Both models were coupled with a Navier-Stokes solver in a simple, robust, and efficient way. The numerical solution of both the flow and the turbulence model equations is based on a cell centered finite volume scheme and on an explicit Runge-Kutta method for time integration. The code was applied to compute the transonic flow in a cascade of nozzle guide vanes (NGV's) developed by Alfa Romeo Avio S.p.A. The computations were performed both for a cascade of 'solid' vane profiles and for a cascade of 'cutted' vane profiles that allow coolant flow ejection through a slot on the pressure side near the trailing edge. The NGV cascade is still under testing and at present only the experimental data for the 'solid' NGV cascade are available for code validation. The computational results presented show that the proposed coupling of the k-omega model with the explicit Navier-Stokes solver does not seem to suffer from the stiffness problems often characterizing other two-equation turbulence models. Copyright Avail: CASI HC A03/MF A04

A numerical method for solving the three-dimensional, Navier-Stokes equations for unsteady, viscous flow and heat transfer through multiple turbomachinery blade rows is presented. The method solves the fully three-dimensional Navier-Stokes equations with an implicit scheme which is based on a control volume approach. A two-equation turbulence model with a low Reynolds number modification is employed. A third-order accurate upwinding scheme is used to approximate convection terms while a second order accurate central difference scheme is used for the discretization of viscous terms. A second-order accurate scheme is employed for the temporal discretization. The numerical method is applied to study the unsteady flow and heat transfer field of the High Pressure Fuel side Turbo-Pump (HPFTP) of the Space Shuttle Main Engine (SSME). The stage calculation is performed by coupling the stator and the rotor flow fields at each time step through an over-laid grid. Numerical results for the complete geometry with the vane trailing edge cutback are presented and compared with the available experimental data. Author (revised)

(Contract BMFT-0326800D)
(ETN-93-93454) Avail: CASI HC A05/MF A01

A theoretical analysis of the optical method for blade vibration measurements with special emphasis on multiprobe systems (more than two probes) was performed. On the basis of a theoretical model, guidelines for the optimization of the experimental setup and for the analysis of experimental errors are given. Test calculations show that the blade vibrations can be reliably detected even in the presence of disturbances. In multiprobe systems, equidistant arrangements of the probes on the circumference of the rotor are preferred. For this case, robust evaluation algorithms are presented. It is shown that blade vibrations can be analyzed not only for static but also for fast transient excitations using the optical system. ESA

Ceramic composite materials have the capability to sustain high stress in the presence of high temperatures and aggressive atmospheres. Such materials are being considered for application as combustors, burner cubes, heat exchangers, headers. hot-gas filters, and even rotors of stationary gas turbine engines. In the present program, Nicalon preforms of tubular geometry were fabricated with different fiber architectures (filament winding, 3D braiding, or cloth winding) to tailor the mechanical properties for specific applications. However, these applications require that candidate materials be carefully characterized. Mechanical characterization must establish the properties and performance that are essential for structural design of the turbine components. For this purpose, a full complement of properties is needed, i.e., the stiffness and strengths of the composite material at a range of temperatures, and the fatigue and creep behavior of the materials under the stress states anticipated by the user. This mechanical characterization requires specialized equipment and methodologies, which are now under development by the authors. This paper will present a description of the methodologies required for ceramic composite characterization, and will describe initial results for ceramic composite tubes, a representative geometry for gas turbine components. Future needs and opportunities will also be discussed. DOE

THRUST AUGMENTATION SYSTEM FOR LOW-COST-EXPENDABLE TURBOJET ENGINE Final Report, 26 Jun. 1992 - 31 Mar. 1993
Bryan J. Seegers and David G. Shreiner 31 Mar. 1993 65 p
(Contract DAAH01-92-C-R359)
(AD-A263727) Avail: CASI HC A04/MF A01

During the performance period, a dump-combustor afterburner and water/methanol injection system were designed, fabricated, and tested on a Sundstrand TJ-90 expendable-turbojet engine. Maximum thrust measured was 150 lbs. This yields an augmentation ratio of 1.57. Also evaluated were silicone based and alumina based lining materials for the afterburner combustion tube and coated-graphite and alumina based materials for the exit nozzle. Water/methanol injection was tested at four engine stations: 8 inches upstream of the compressor face, directly upstream of the compressor deswirl vanes, directly into the combustor dilution region and downstream of the turbine exit. Maximum predicted water/methanol flow rates could not be achieved due to combustor flame out. Performance was measured in the following ways: dry, with water/methanol only, with afterburner only, and with afterburner and water/methanol injection. DTIC

An articulated control surface is provided for hydrodynamic control utilizing a moldable control surface. The central surface is shaped by contracting and elongating wire bundles fabricated with shape-memory alloys located in an adjacent cooling chamber. The shape-memory alloys contract when heated via an applied electric current and elongate when cooled, i.e., the electric current is removed. A pair of wire bundles is anchored inside the cooling chamber. Each bundle is routed over several pulleys in such a manner that a lateral movement is produced at the actuator end of the wire. A pair of bundles act in opposition to maintain dynamic tension at the actuator end. Cooling flow to opposing wire bundles is controlled independently to enhance response time and reduce power requirements. The actuator is a post extending from the cooling chamber to the trailing edge structure of the control surface. DTIC

ROBUST CONTROL OF INTELLIGENT ROTOR
Reza Kashani 22 Feb. 1993 37 p

(Contract DAAL03-92-G-0303)
(AD-A263707; ARO-30299-1-EG-II) Avail: CASI HC A03/MF A01

The performance and robustness of the intelligent rotors under feedback control depend on the fidelity of the models used in designing their controllers. This is also true for other kinds of smart structures. A computer aided robust control design program has been developed that takes the percentage of the variation on the parameters, as well as the desired number of modes to be included in the model and designs a robust controller that guarantees the stability of the system in presence of the formulated uncertainty. Moreover, the use of Terfenol-D magnetostrictive rods for actuation of an intelligent rotor is explored. The challenge in the use of these actuators in intelligent rotor applications is housing them in the structure of the rotor. The packaging of the Terfenol rod actuators, considered in this work, inside the structure of the rotor blade is based on lining the actuators inside the spar along the axis of the blade. This is possible due to the fact that most blades have a hollow D or box spar. The two ends of each actuator is sandwiched between two plates which, for flapwise actuation of the spar, are attached to the top and bottom of the spar, alternatively. This arrangement translate the actuator force to two point moments on the blade at the plate populations. DTIC

COMPUTATION OF A DELTA-WING ROLL-AND-HOLD MANEUVER Final Report, 1 Feb. 1992 - 1 Feb. 1993
Raymond E. Gordnier and Miguel Visbal 12 Feb. 1993 46 p
(AD-A264704; WL-TR-93-3016) Avail: CASI HC A03/MF A01

This report presents computations of the flowfield around an 80 degree sweep delta wing undergoing a constant roll-rate maneuver from 0 to 45 degrees. The governing equations for the problem are the unsteady, three-dimensional Navier-Stokes equations. The equations are solved using the implicit, approximately-factored algorithm of Beam-Warming. Fixed roll angle results are also presented and compared with experimental measurements to demonstrate the ability of the numerical technique to accurately capture the flowfield around a rolled delta wing. The dynamic behaviors of the vortex position and strength, as well as their corresponding effect on surface pressure, lift, and roll moment are described. A simple, quasi-static explanation of these vortex behaviors based on effective angle-of-attack and sideslip angle is proposed. DTIC

ANALYTICAL FOUNDATIONS OF GAIN SCHEDULING Final Report, 1 Mar. 1990 - 28 Feb. 1993
Wilson J. Rugh 15 Mar. 1993 7 p
(Grant AF-AFOSR-0138-90)
(AD-A264682; AFOSR-93-0325TR) Avail: CASI HC A02/MF A01

This final report briefly describes research results on a theory of gain scheduling for flight control applications that were obtained by the Principal Investigator and his students over the three-year period of support. Results reported include development of a basic theory of gain scheduling in nonlinear systems, solution of output regulation problems based on an exogenous system assumption for the exogenous signals (including disturbance and scheduling signals), initial development of methods to alleviate performance degradation in the case of rapidly-varying scheduling signals, and an exploratory application of these results to an autopilot design example. Publications describing the results in detail are listed. DTIC

OPTIMAL TRAJECTORIES FOR AIRCRAFT TERRAIN FOLLOWING AND TERRAIN AVOIDANCE: A LITERATURE REVIEW UPDATE
M. E. Halpern Mar. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A264075; ARL-TR-5; DODA-AR-006-630) Avail: CASI HC A03

This is a literature review relevant to the automated design of flight paths for low-flying military aircraft in terrain following and terrain avoidance roles. Improvements in computer technology continue to widen the range of approaches which may be applied to this important problem. In particular, there is interest in the application of techniques which use elements of artificial intelligence. DTIC

FLIGHT CONTROL SYSTEM DESIGN FACTORS FOR APPLYING AUTOMATED TESTING TECHNIQUES
Joel R. Sitz and Todd H. Vernon (Planning Research Corp., Edwards, CA.) Washington Oct. 1990 17 p Presented at the 9th Annual Digital Avionics System Conference, Virginia Beach, VA, 15-18 Oct. 1990; sponsored by IEEE Previously announced in IAA as A91-54610
(RTOP 533-02-51)
(NASA-TM-4242; H-1631; NAS 1.15:4242) Avail: CASI HC A03/MF A01

Automated validation of flight-critical embedded systems is being done at ARC Dryden Flight Research Facility. The automated testing techniques are being used to perform closed-loop validation of man-rated flight control systems. The principal design features and operational experiences of the X-29 forward-swept-wing aircraft and F-18 High Alpha Research Vehicle (HARV) automated test systems are discussed. Operationally applying automated testing techniques has accentuated flight control system features that either help or hinder the application of these techniques. The paper also discusses flight control system features which foster the use of automated testing techniques. Derived from text

RENDERING THE OUT-THE-WINDOW VIEW FOR THE AFIT VIRTUAL COCKPIT M.S. Thesis
W. D. McCarty Mar. 1993 50 p
(AD-A262599; AFIT/GCS/ENG/93M-04) Avail: CASI HC A03/MF A01

The Air Force Institute of Technology (AFIT) is developing a distributed interactive flight simulator, the Virtual Cockpit, using commercial graphics workstations and helmet mounted displays. The Virtual Cockpit communicates with other simulators via local and long-haul networks using the SIMNET protocol. The work reported in this thesis focuses on developing the terrain database for the synthetic environment and on rendering the pilot's view of the database. There are many different file formats for describing 3-dimensional geometric polygonal objects. An analysis of three formats, AFIT GEOM, the Naval Postgraduate School (NPS) DRP, and Software Systems' Flight, is presented. Each file format is described, and their attributes are compared in a decision table. A series of C++ classes were developed to render the file format used by the terrain database. These C++ classes, which include classes for stationary and moving entities, and for textures, are discussed. A technique for increasing the rendering speed is also presented. DTIC

AIRCRAFT AND REFUELER BONDING AND GROUNDING STUDY
Feb. 1993 48 p
(AD-A262027; CRC-583) Avail: CASI HC A03/MF A01

The 1990 Edition of NFPA 407, Standard on Aircraft Fuel Servicing, deleted the requirement for grounding during aircraft fueling and tank truck loadings. This change has caused a great deal of concern in the industry since it impacts not only refueling operations, but also airport construction and maintenance. In order to resolve the more controversial aspects of this change, the Coordinating Research Council (CRC) Electrical Discharges Liaison Group conducted a series of tests at Denver Stapleton Airport, 30 October-8 November 1991. This test program culminated in a demonstration of a simulated aircraft refueling operation conducted with and without the use of ground wires. The demonstration was witnessed by representatives from the FAA, the airline, air cargo and aircraft fueling industries, airport design industry and the Denver Fire Department. The program did not address grounding requirements for purposes other than refueling. DTIC

MATHEMATICAL MODELING AND CONTROL LAW DEVELOPMENT FOR THE ATMOSPHERIC MONITORING AND CONTROL SYSTEM OF THE CONTROLLED ENVIRONMENT RESEARCH CHAMBER (CERC) AT NASA AMES RESEARCH CENTER M.S. Thesis
Bruce H. Mathers Dec. 1992 127 p
(AD-A261978) Avail: CASI HC A07/MF A02

The objective of this research is to develop a mathematical model and control algorithm for maintenance of the environmental system within the Controlled Environmental Research Chamber (CERC) located at the National Aeronautics and Space Administration (NASA) Ames Research Center, Moffet Field, CA. The hypobaric research chamber is currently undergoing renovation as part of the Human Exploration Development Project (HEDP), an effort on behalf of NASA for advanced life support research. A broad overview of the chamber is provided which includes a physical description, preliminary system hardware and associated performance, and potential experimental uses. A mathematical model of the chamber air mass is developed based on key energy and mass balances. Two methods of adaptive control have been implemented for the coupled control of temperature, composition, pressure and humidity within the closed environment. Simulations testing the control algorithm performance are conducted, including a sup and modified ramp response. The results of the simulations indicate the adaptive methods performed well for the model presented. Further research is required in refining the chamber model for algorithm optimization including integration of hardware dynamics. DTIC

TWO SIMULATION STUDIES OF PRECISION RUNWAY MONITORING OF INDEPENDENT APPROACHES TO CLOSELY SPACED PARALLEL RUNWAYS
Ann Marie T. Lind 2 Mar. 1993 129 p
(Contracts DTFA01-89-Z-02033; F19628-90-C-0002)
(AD-A263433; ATC-190; DOT/FAA/NR-92/9) Avail: CASI HC A07/MF A02

This report documents the findings of two simulation studies of air traffic controller reaction to the Precision Runway Monitor (PRM). The PRM is a new system for monitoring independent approaches to closely spaced parallel runways. It consists of a radar which has higher accuracy and a faster update interval than the current system. The PRM radar is accompanied by a high-resolution color display which provides automated visual and vocal warnings to alert controllers of impending and actual penetration of a 'No Transgression Zone' between parallel runways. The studies, were conducted in order to determine the effects of key variables on controller reaction time and to determine controller opinion on system acceptability. Study 1 examined the use of the PRM when the runway separation was both 3,400 ft and 4,300 ft. Study 2 examined the use of the PRM when the runway separation was 3,000 ft. Real-time simulated approach blunders were presented to controllers, and measurements of their reaction times were recorded and analyzed. Independent variables studied included sensor update interval, runway separation, deviation angle, deviation range, flight path condition, approach blunder type, and controller experience level. In addition, controller opinions of the PRM were surveyed. Findings regarding the effects of each of the variables are reported. Survey results of controller opinion are reported. Recommendations for enhancing the realism of the simulation and recommendations of issues for future study are discussed. DTIC

X RAY MICROSCOPY RESOURCE CENTER AT THE ADVANCED LIGHT SOURCE
W. Meyer-Ilse, M. Koike, R. Beguiristain, J. Maser, and D. Attwood Jul. 1992 4 p Presented at the SPIE International Symposium on Optical Applied Science and Engineering, San Diego, CA, 19-24 Jul. 1992
(Contract DE-AC03-76SF-00098)
(DE93-010449; LBL-32323; CONF-920792-51) Avail: CASI HC A01/MF A01

An x-ray microscopy resource center for biological x-ray imaging will be built at the Advanced Light Source (ALS) in Berkeley. The unique high brightness of the ALS allows short exposure times and high image quality. Two microscopes, an x-ray microscope (XM) and a scanning x-ray microscope (SXM) are planned. These microscopes serve complementary needs. The XM gives images in parallel at comparable short exposure times, and the SXM is optimized for low radiation doses applied to the sample. The microscopes extend visible light microscopy towards significantly higher resolution and permit images of objects in an aqueous medium. High resolution is accomplished by the use of Fresnel zone plates. Design considerations to serve the needs of biological x-ray microscopy are given. Also, the preliminary design of the microscopes is presented. Multiple wavelength and multiple view images will provide elemental contrast and some degree of 3D information. DOE

DEVELOPMENT OF A CONCEPT FORMULATION PROCESS AID FOR ANALYZING TRAINING REQUIREMENTS AND DEVELOPING TRAINING DEVICES Final Report, Apr. 1991 - Jul. 1992
Paul A. Sticha, Stephens Gibbons, and Michael J. Singer Mar. 1993 39 p
(Contract DAHC35-89-D-0046; DA Proj. 2Q2-63007-A-795)
(AD-A263579; ARI-RR-1637) Avail: CASI HC A03/MF A01

This report describes the development of a concept formulation process decision aid that addresses the tradeoff determination phase. It adapts previously developed models for use during a specific step in the development of a training device. The report identifies the source of information used and explains the rationale for the development of different aspects of the system,. A brief overview of the aiding system is presented. The goals of the aid are introduced and the steps taken to meet those goals are presented. The report describes the data elements, links between elements, and aiding functions and presents and discusses the evaluation of the system by projected users and the results of that evaluation. Difficulties discovered during development and suggestions for future research and development are presented in the conclusion. DTIC

MATHEMATICAL MODEL OF FROST HEAVE AND THAW SETTLEMENT IN PAVEMENTS

Gary L. Guymon, Richard L. Berg, and Theodore V. Hromadka Apr. 1993 128 p
(Contract DTFA01-84-Z-02038)
(CRREL-REPT-93-2; DOT/FAA/RD-93/15) Avail: CASI HC A07/MF A02

Since 1975, the U.S. Army Corps of Engineers, The Federal Highway Administration, and the Federal Aviation Administration have been working cooperatively to develop a mathematical model to estimate frost heave and thaw weakening under various environmental conditions and for various pavement designs. A model has been developed. It is a 1D representation of vertical heat and moisture flux, is based on a numerical solution technique termed the nodal domain integration method, and estimates frost heave and frost penetration reasonably well for a variety of situations. The model is now ready for additional field evaluation and implementation in appropriate cases. The main objectives are the following: (1) to describe the model, FROST, including modeling uncertainties and errors; (2) to summarize recent comparisons between measured and computed values for frost heave and frost penetration; and (3) to describe parameters necessary for input into the model. LOW-COST ACTIVE STRUCTURAL CONTROL SPACE EXPERIMENT (LASC) **c18**
Rush Robinett (Sandia National Labs., Albuquerque, NM.) and Angelia P. Bukley *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 14 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

The DOE Lab Director's Conference identified the need for the DOE National Laboratories to actively and aggressively pursue ways to apply DOE technology to problems of national need. Space structures are key elements of DOD and NASA space systems and a space technology area in which DOE can have a significant impact. LASC is a joint agency space technology experiment (DOD Phillips, NASA Marshall, and DOE Sandia). The topics are presented in viewgraph form and include the following: phase 4 investigator testbed; control of large flexible structures in orbit; INFLEX; Controls, Astrophysics; and structures experiments in space; SARSAT; and LASC mission objectives. The objectives are the following: (1) to develop and demonstrate in-space performance of both passive and active damping systems for suppression of micro-amplitude vibration on an actual application structure and operate despite uncertain dynamics and uncertain disturbance characteristics; and (2) to correlate ground and in-space performance - the performance metric is vibration attenuation. The goals are to achieve vibration suppression equivalent to 5 percent passive damping in selected models and 15 percent active damping in selected modes. Various aspects of this experiment are presented in viewgraph form. Derived from text

CONTROL-STRUCTURES INTERACTION TEST OF THE LACE SATELLITE **c18**
Lawrence W. Taylor, Jr. and Shalom Fisher (Naval Research Lab., Washington, DC.) *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 21 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

It is clear that additional experience and validation of Control Structures Interaction (CSI) techniques are needed in controlling the structural dynamics of flexible spacecraft. It is also clear that the effects of the space environment such as weightlessness dictate that this be done in space. Unfortunately, orbital tests are difficult to achieve because of the high cost of the test article, the launch into orbit, the instrumentation, and communication systems. The Low-power Atmospheric Compensation Experiment (LACE) Satellite has provided an opportunity to achieve a CSI test in space for very little cost. First, the CSI test rode piggy-back and did not interfere with the primary objective of LACE. Second, the novel technique of using ground based measurements of vibration of the orbiting satellite was employed. The LACE has a heavy central body to which is attached booms with lengths as long as 150 feet. The ground measurements were obtained using laser Doppler radar at the MIT Lincoln Laboratory Firepond Facility. The initial tests demonstrated the accuracy of the vibration measurements and obtained structural responses for enhancing the accuracy of the mathematical model of the structural dynamics. Germanium corner-cube retroreflectors attached to the central body and a boom deployed to 18 feet ensured a high strength return signal. Subsequent tests demonstrated the ability of an open-loop damper to attenuate the vibrations of the orbiting satellite. The LACE test results are important in contributing to the validation of a CSI technique, and demonstrating a novel ground measurement technique for orbital tests that is accurate but which has very low cost. LIQUID MOTION IN A ROTATING TANK EXPERIMENT (LME) c20
F. T. Dodge *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 20 p Sponsored by NASA. Goddard Space Flight Center (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

The Liquid Motion in Rotating Tank Experiment (LME) will investigate and quantify liquid motions occurring in spin-stabilized spacecraft; acquire representative data to validate ground-test scaling procedures; and obtain scientific understanding to formulate better analytical models. LME eliminates the limitations of ground testing. LME design is nearing the end of phase B: the breadboard hardware model has been completed; the load cells have been fabricated and tested; the experiment computer has been flight qualified; and other electronics have been breadboarded. Various aspects of this experiment are presented in viewgraph form. Derived from text

TANK PRESSURE CONTROL EXPERIMENT/THERMAL PHENOMENA (TPCE/TP) c20
M. M. Hasan and R. H. Knoll *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 18 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

The 'Tank Pressure Control Experiment/Thermal Phenomena (TPCE/TP)' is a reflight of the tank pressure control experiment (TPCE), flown on STS-43 in a standard Get-Away Special (GAS) container in August 1991. The TPCE obtained extensive video and digital data of the jet induced mixing process in a partially filled tank in low gravity environments. It also provided limited data on the thermal processes involved. The primary objective of the reflight of TPCE is to investigate experimentally the phenomena of liquid superheating and pool nucleate boiling at very low heat fluxes in a long duration low gravity environment. The findings of this experiment will be of direct relevance to space based subcritical cryogenic fluid system design and operation. Experiment hardware and results from the first TPCE are described in outline and graphic form. Author (revised)

SODIUM-SULFUR CELL TECHNOLOGY FLIGHT EXPERIMENT (SSCT) c44
Carl R. Halbach *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 8 p (For primary document see N93-28699 11-12)
Avail: CASI HC A02/MF A10

The sodium-sulfur battery is emerging as a prime high-temperature energy storage technology for space flight applications. A Na-S cell demonstration is planned for a 1995-96 NASA Space Shuttle flight which focuses on the microgravity effects on individual cells. The experiment is not optimized for battery performance as such. Rather, it maximizes the variety of operating conditions which the Na-S cell is capable of in a relatively short 5-day flight. The demonstration is designed to reveal the effects of microgravity by comparison with ground test control cells experiencing identical test conditions but with gravity. Specifically, limitations of transport dynamics and associated cell performance characteristics should be revealed. The Na-S Cell Technology Flight Experiment consists of three separate experiments designed to determine cell operating characteristics, detailed electrode kinetics and reactant distributions. THERMAL ENERGY STORAGE FLIGHT EXPERIMENT IN MICROGRAVITY **c44**
David Namkoong *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 12 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

The Thermal Energy Storage Flight Experiment was designed to characterize void shape and location in LiF-based phase change materials in different energy storage configurations representative of advanced solar dynamic systems. Experiment goals and payload design are described in outline and graphic form. CASI

N93-28721*# National Aeronautics and Space Administration. Goddard Space Flight Center, Greenbelt, MD.
CRYOGENIC HEAT PIPE EXPERIMENT (CRYOHP) **c44**
Roy McIntosh *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 21 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

The objective of the CRYOHP experiment is to conduct a shuttle experiment that demonstrates the reliable operation of two oxygen heat pipes in microgravity. The experiment will perform the following tasks: (1) demonstrate startup of the pipes from the supercritical state; (2) measure the heat transport capacity of the pipes; (3) measure evaporator and condenser film coefficients; and (4) work shuttle safety issues. The approach for the experiment is as follows: (1) fly two axially grooved oxygen heat pipes attached to mechanical stirling cycle tactical coolers; (2) integrate experiment in hitch-hiker canister; and (3) fly on shuttle and control from ground. Derived from text

N93-28722*# Hughes Aircraft Co., Torrance, CA.
HEAT PIPE PERFORMANCE EXPERIMENT **c44**
George Fleischman *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 40 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

The objective of the heat pipe performance experiment is to answer questions about how heat pipe performance in space differs from heat pipe performance on the ground. This part of the experiment will attempt to account for the following: (1) gravity domination in ground testing; (2) surface tension domination in a microgravity environment; and (3) the effects of underfill and overfill. The secondary objective of the experiment is to obtain quantitative data for axial groove and porous wick heat pipes in a microgravity environment for comparison with the following: (1) analytical models; (2) ground test data; and (3) existing flight data. Derived from text

MEASUREMENT OF THE RELATIVE AND ABSOLUTE MICROGRAVITY ENVIRONMENT OF SPACE PLATFORMS, RECENT FLIGHT RESULTS, AND DETERMINATION OF THE SPATIAL MICROGRAVITY FIELD c29
J. A. Bijvoet, J. Randorf, D. R. Wingo, and J. R. Blakely *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 19 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

Microgravity material processing in space, such as crystal growth, requires specific and accurate knowledge of the very low frequency, very low level microgravity. This means knowledge of absolute microgravity levels. Most acceleration measurement systems for space platforms only measure 'microvibrations,' the measurement of the absolute microgravity level being severely corrupted by bias errors, temperature hysteresis, nonlinearity by-products, and bias changes due to launch vibrations. An advanced system was developed incorporating a fixed 3-axis acceleration measurement system with improved signal conditioning and Invertible Accelerometers for absolute measurements. The higher sensitivity channels have lower frequency low pass filtering to meet crystal growers demands for recording of low level/low frequency disturbances. Also included is a pre-flight bias adjustment feature. Author (revised)

ENVIRONMENTAL VERIFICATION EXPERIMENT FOR THE EXPLORER PLATFORM (EVEEP) c18
Bonnie Norris and Chris Lorentson *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 14 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

Satellites and long-life spacecraft require effective contamination control measures to ensure data accuracy and maintain overall system performance margins. Satellite and spacecraft contamination can occur from either molecular or particulate matter. Some of the sources of the molecular species are as follows: mass loss from nonmetallic materials; venting of confined spacecraft or experiment volumes; exhaust effluents from attitude control systems; integration and test activities; and improper cleaning of surfaces. Some of the sources of particulates are as follows: leaks or purges which condense upon vacuum exposure; abrasion of movable surfaces; and micrometeoroid impacts. The Environmental Verification Experiment for the Explorer Platform (EVEEP) was designed to investigate the following aspects of spacecraft contamination control: materials selection; contamination modeling of existing designs; and thermal vacuum testing of a spacecraft with contamination monitors. RETURN FLUX EXPERIMENT c18
June L. Tveekrem *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 15 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

All spacecraft emit molecules via outgassing, thruster plumes, vents, etc. The return flux is the portion of those molecules that scatter from the ambient atmosphere and return to the spacecraft. Return flux allows critical spacecraft surfaces to become contaminated even when there is no direct line of sight between the contamination source and the critical surface. Data from the Long Duration Exposure Facility (LDEF) show that contamination of LDEF surfaces could not have come entirely from direct flux. The data suggest significant return flux. Several computer models have been developed to simulate return flux, but the predictions have never been verified in orbit. Large uncertainties in predictions lead to overly conservative spacecraft designs. The purpose of the REturn FLux EXperiment (REFLEX) is to fly a controlled experiment that can be directly compared with predictions from several models. Derived from text

RADIATION MONITORING EQUIPMENT DOSIMETER EXPERIMENT c19
Kenneth A. Hardy (Aerospace Medical Research Labs., Brooks AFB, TX.), Michael J. Golightly, and William Quam (EG and G Energy Measurements, Inc., Goleta, CA.) *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 33 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

Spacecraft crews risk exposure to relatively high levels of ionizing radiation. This radiation may come from charged particles trapped in the Earth's magnetic fields, charged particles released by solar flare activity, galactic cosmic radiation, energetic photons and neutrons generated by interaction of these primary radiations with spacecraft and crew, and man-made sources (e.g., nuclear power generators). As missions are directed to higher radiation level orbits, viz., higher altitudes and inclinations, longer durations, and increased flight frequency, radiation exposure could well become a major factor for crew stay time and career lengths. To more accurately define the radiological exposure and risk to the crew, real-time radiation monitoring instrumentation, which is capable of identifying and measuring the various radiation components, must be flown. This presentation describes a radiation dosimeter instrument which was successfully flown on the Space Shuttle, the RME-3. Author

NPB CESIUM SPACE EXPERIMENT c73
George M. Parsons, III *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 11 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

Neutral Particle Beam (NPB) weapons systems are planned to perform the ballistic missile defense functions of nuclear weapon/decoy discrimination and warhead kill at appropriate energy levels and ion currents. Negatively charged ions are produced in a specialized ion source and focused into a high quality particle beam. NPB linear accelerators accelerate and steer the negatively charged ions using electric and magnetic fields. After acceleration and steering the neutralizer system strips away extra electrons from ions to form the electrically neutral particle beam. The neutral beam then travels through space to the target unaffected by the Earth's magnetic fields. Continuing technological advances have greatly reduced the size and weight of NPB accelerator systems. Ion current production has been enhanced by over 100 percent with the intermittent addition of cesium at the NPB ion source device. This increase in current is essential to attain the most light weight, compact NPB platforms and minimize expensive launch costs. Addition of cesium into the ion source has been identified by the NPB community as the highest priority risk reduction space experiment necessary prior to planned NPB accelerator experiments and later weapons systems. The NPB Cesium Space Experiment is planned to successfully demonstrate controlled cesium introduction and vaporization into a simulated ion source chamber. Microgravity effects on the cesium deposition will be studied as will the effects of small amounts of cesium on high voltage accelerator components that might be susceptible to electrical insulator break downs. The experiment design will simulate as closely as possible the environment, physical and operational characteristics of the actual NPB ion source. Author

THE EMULSION CHAMBER TECHNOLOGY EXPERIMENT **c35**

John C. Gregory *In* NASA, Washington, NASA/DOD Flight Experiments Technical Interchange Meeting Proceedings 1992 16 p (For primary document see N93-28699 11-12)
Avail: CASI HC A03/MF A10

Photographic emulsion has the unique property of recording tracks of ionizing particles with a spatial precision of 1 micron, while also being capable of deployment over detector areas of square meters or 10's of square meters. Detectors are passive, their cost to fly in Space is a fraction of that of instruments of similar collecting. A major problem in their continued use has been the labor intensiveness of data retrieval by traditional microscope methods. Two factors changing the acceptability of emulsion technology in space are the astronomical costs of flying large electronic instruments such as ionization calorimeters in Space, and the power and low cost of computers, a small revolution in the laboratory microscope data-taking. Our group at UAH made measurements of the high energy composition and spectra of cosmic rays. The Marshall group has also specialized in space radiation dosimetry. Ionization calorimeters, using alternating layers of lead and photographic emulsion, to measure particle energies up to 10(exp 15) eV were developed. Ten balloon flights were performed with them. No such calorimeters have ever flown in orbit. In the ECT program, a small emulsion chamber was developed and will be flown on the Shuttle mission OAST-2 to resolve the principal technological questions concerning space exposures. These include assessments of: (1) pre-flight and orbital exposure to background radiation, including both self-shielding and secondary particle generation; the practical limit to exposure time in space can then be determined; (2) dynamics of stack to optimize design for launch and weightlessness; and (3) thermal and vacuum constraints on emulsion performance. All these effects are cumulative and affect our ability to perform scientific measurements but cannot be adequately predicted by available methods. Author (revised)

ANALYSIS OF ORBITAL SYSTEM LOGISTICS IN THE CIS-LUNAR SPACE WITH PARTICULAR CONSIDERATION OF LIFE CYCLE COSTS Ph.D. Thesis [ANALYSE DER LOGISTIK VON ORBITALSYSTEMEN IM CIS-LUNAREN RAUM UNTER BESONDERER BERUECKSICHTIGUNG DER LEBENSZYKLUSKOSTEN]

Stephanos Melissopoulos Feb. 1992 160 p In GERMAN
(ETN-93-93484) Avail: CASI HC A08/MF A02

An attempt to define and analyze the concept of 'logistics of space operation centers' in an infrastructure scenario is presented. A logistics system was designed, which is strongly linked to the transportation system used. A narrow relation between operations in a space operation center and the transport model considered was established. Typical space transportation system designs were adapted and integrated in the logistics/life cycle cost model. A space operation center was conceived from general equations for calculation of module masses of rockets and from the NEPTUN booster project. A simulation model with a mass model, operation model and life cycle cost model was developed for evaluation of life cycle costs of a space operation center. Calculation results give reference costs for exploitation of orbital stations and requirements on space operation center service achievements. These results allow a relation between operations at space operation centers and transportation systems in an orbital infrastructure to be established from a logistic point of view. A sensitivity analysis shows that input parameters must be carefully chosen, because a minimal variation can very strongly modify the results. ESA

SPACE TRANSFER CONCEPTS AND ANALYSES FOR EXPLORATION MISSIONS, PHASE 3 Final Report

Gordon R. Woodcock Jun. 1993 347 p
(Contract NAS8-37857)
(NASA-CR-192584; NAS 1.26:192584; D615-10062-2) Avail: CASI HC A15/MF A03

This report covers the third phase of a broad-scoped and systematic study of space transfer concepts for human lunar and Mars missions. The study addressed issues that were raised during Phase 2, developed generic Mars missions profile analysis data, and conducted preliminary analysis of the Mars in-space transportation requirements and implementation from Stafford Committee Synthesis Report. The major effort of the study was the development of the first Lunar Outpost (FLO) baseline which evolved from the Space Station Freedom Hab Module. Modifications for the First Lunar Outpost were made to meet mission requirements and technology advancements. Author (revised)

Documentation for the User Interface Program for the Minimum Hamiltonian Ascent Trajectory Evaluation (MASTRE) is provided. The User Interface Program is a separate software package designed to ease the user input requirements when using the MASTRE Trajectory Program. This document supplements documentation on the MASTRE Program that consists of the MASTRE Engineering Manual and the MASTRE Programmers Guide. The User Interface Program provides a series of menus and tables using the VAX Screen Management Guideline (SMG) software. These menus and tables allow the user to modify the MASTRE Program input without the need for learning the various program dependent mnemonics. In addition, the User Interface Program allows the user to modify and/or review additional input Namelist and data files, to build and review command files, to formulate and calculate mass properties related data, and to have a plotting capability. AUTOMATED SATELLITE IMAGE NAVIGATION M.S. Thesis
Robert M. Bassett Dec. 1992 89 p
(AD-A262868) Avail: CASI HC A05/MF A01

The automated satellite image navigation method (Auto-Avian) developed and tested by Spaulding (1990) at the Naval Postgraduate School is investigated. The Auto-Avian method replaced the manual procedure of selecting Ground Control Points (GCP's) with an autocorrelation process that utilizes the World Vector Shoreline (WVS) provided by the Defense Mapping Agency (DMA) as a string of GCP's to rectify satellite images. The automatic cross-correlation of binary reference (WVS) and search (image) windows eliminated the subjective error associated with the manual selection of GCP's and produced accuracies comparable to the manual method. The scope of Spaulding's (1990) research was expanded. The worldwide application of the Auto-Avian method was demonstrated in three world regions (eastern North Pacific Ocean, eastern North Atlantic Ocean, and Persian Gulf). Using five case studies, the performance of the Auto-Avian method on 'less than optimum' images (i.e., islands, coastlines affected by lateral distortion and/or cloud cover) was investigated. DTIC

The analysis presented in this paper defines the reference coordinate frames, equations of motion, and control parameters necessary to model the relative motion and attitude of spacecraft in close proximity with another space system during the Automatic Rendezvous and Capture phase of an on-orbit operation. The relative docking port target position vector and the attitude control matrix are defined based upon an arbitrary spacecraft design. These translation and rotation control parameters could be used to drive the error signal input to the vehicle flight control system. Measurements for these control parameters would become the bases for an autopilot or feedback control system (FCS) design for a specific spacecraft. Author (revised)

DOUBLE SWINGBY AT EARTH-MOON FOR INCREASE OF EXCESS VELOCITY Ph.D. Thesis [DOPPEL-SWING-BY AM ERDMOND ZUR STEIGERUNG DER EXZESSGESCHWINDIGKEIT]

Kok Kiong Ong 1992 111 p In GERMAN
(ETN-93-94177) Avail: CASI HC A06/MF A02

The minimal start velocity for leaving the Earth-Moon system is analytically determined in the framework of the three body problem (spaceprobe, Earth, and Moon). The patched conic method for precise trajectory calculation is presented. Space probe, Earth, and Moon were considered as point objects and motion differential equations were solved with Jacobi integral and Hill curves. Numerical integration was carried out with Runge-Kutta method. Start velocity for the free flight Moon swing by was iteratively ascertained. A sensitivity analysis was conducted for estimating accuracy of space vector of Moon and velocity vector of spaceprobe components. ESA

Avail: CASI HC A02/MF A01

A new test facility was constructed at the NASA Lewis Research Center Rocket Laboratory for the purpose of conducting rocket propulsion research at up to 8.9 kN (2000 lbf) thrust, using liquid oxygen and gaseous hydrogen propellants. A laser room adjacent to the test cell provides access to the rocket engine for advanced laser diagnostic systems. The size and location of the test cell provide the ability to conduct large amounts of testing in short time periods, with rapid turnover between programs. These capabilities make the new test facility an important asset for basic and applied rocket propulsion research. Author (revised)

ESTIMATING TEST RANGE CAPACITY M.S. Thesis

Paul A. McDaniel 5 Mar. 1993 160 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A262493; AFIT/GST/ENS/93M-08) Avail: Issuing Activity (Defense Technical Information Center (DTIC)

The main focus of this thesis effort was to develop a means to estimate the capacity of the test range complex at Eglin AFB, Florida. For the purposes of this study, test range capacity was defined as the maximum number of missions, of a given set, that could possibly be supported by range resources on any given day. In trying to determine this number, the complexities of the overall multi-resource constrained scheduling problem dictated a more practical approach be taken in modeling the allocation process of range resources to test missions. Therefore, a series of three single-resource, 0-1 integer programming models depicting the allocation of Test Wing aircraft, radars, and range area resources were developed to produce an upper bound estimate of the range capacity for a given set of missions. In actual testing, the Range Area Allocation Model produced some poor results and therefore, cannot be used in its present form. However, both the Aircraft and Radar Models appear to produce legitimate upper bounds on range capacity in all cases. Nevertheless, to insure the goodness of these two models, further testing is recommended. In addition, a single model depicting the allocation of these two resources and possibly several other, should be developed in order to better estimate range capacity. DTIC

AUTOMATING THE SATELLITE RANGE SCHEDULING PROCESS M.S. Thesis

Timothy D. Gooley Mar. 1993 233 p
(AD-A262601; AFIT/GOR/ENS/93M-06) Avail: CASI HC A11/MF A03

Satellite range scheduling is a complex problem that involves scheduling satellite supports in which a satellite and a specific remote tracking station are assigned a time window during which they communicate with each other. As the number and complexity of satellite supports continue to increase, more pressure is placed on the current manual system to efficiently generate a schedule. The objective of this research was to develop a methodology that will automate the generation of the initial 24 hour schedule. The goal of the algorithm developed was to schedule as many conflict free supports as possible. A two phased approach was developed to schedule the supports. The first phase scheduled as many low altitude satellite supports as possible, while the second phase scheduled as many additional high altitude satellite supports as possible. For both phases, schedule generation and schedule improvement algorithms were developed.

The schedule generation algorithms are a mixed integer program linking procedure and an insertion procedure. The schedule improvement algorithms are a two satellite interchange procedure and a three satellite interchange procedure. A schedule was generated for six representative data sets with encouraging results. At least 91% of all satellite support requests were scheduled for each day. These results were comparable to results of the current range schedulers and a previous automation study. Based on the results reported, the methodology presented in this research effort seems to be a valid approach for automating the initial 24 hour schedule. DTIC

TWO-DIMENSIONAL MODEL FOR CURRENT AND HEAT TRANSPORT IN SOLID-ARMATURE RAILGUNS Final Report, Oct. 1991 - Sep. 1992
John D. Powell, David J. Walbert, and Alexander E. Zielinski Feb. 1993 34 p
(AD-A262014; ARL-TR-74) Avail: CASI HC A03/MF A01

A numerical model is developed for solving the equations which predict current and heat transport in a solid-armature railgun. The model is two dimensional and fully time dependent. Some preliminary calculations are carried out for a 'U-shaped' armature similar to that currently under investigation in the ARDEC small and cannon-caliber railgun programs. The most extensive calculations are for a situation in which the projectile is started at rest and accelerated to about 500 m/s in a time of about 1 ms. Results of the calculations can be used to infer, for example, where melting in the armature is most likely to occur and where the electromagnetic fields are largest. For comparison, calculations are also presented for a situation in which the projectile is held fixed. Some discussion of future efforts is given, with particular emphasis on describing how the model might be used to guide the design of armatures, or provide input for other types of calculations relating to electromagnetic guns. SPACE TRANSPORTATION ANALYSIS AND DESIGN (REISSUE A)
R. Hartunian, B. Moss, M. G. Wolfe, J. Statsinger, and L. Forrest 17 Feb. 1993 99 p Supersedes TOR-92(2464)-1, AD-A251036
(Contract F04701-88-C-0089)
(AD-A262752; TOR-92(2464)-1-A; XC-SMC) Avail: CASI HC A05/MF A02

The intent of this TOR is to provide a guide to the processes and technical considerations involved in the selection of a launch vehicle for a given satellite mission, the integration of the satellite with the launch vehicle, and the many elements required to derive life-cycle costs of viable launch system candidates. As such, the document is expected to be of interest to satellite mission planners for preliminary assessments of launch vehicle candidate and of general use to experienced specialists and new engineers in both satellites and launch vehicle sectors. Sufficient quantitative data, orbital and vehicle performance formulae, environmental data, and references have been provided to allow preliminary, first-order assessments which should suffice at the very early planning stages. As the planning process matures, the satellite planners are urged to get the much higher fidelity data on both technical and cost information required for programmatic decisions from the appropriate launch vehicle system program offices (SPOs). DEBRIS/ICE/TPS ASSESSMENT AND INTEGRATED PHOTOGRAPHIC ANALYSIS FOR SHUTTLE MISSION STS-55 Final Report, 22 Mar. - 7 May 1993
Gregory N. Katnik, Barry C. Bowen, and J. Bradley Davis May 1993 136 p Original contains color illustrations
(NASA-TM-107559; NAS 1.15:107559) Avail: CASI HC A07/MF A02; 53 functional color pages

A Debris/Ice/TPS assessment and integrated photographic analysis was conducted for Shuttle mission STS-55. Debris inspections of the flight elements and launch pad were performed before and after launch. Ice/Frost conditions on the External Tank were assessed by the use of computer programs, nomographs, and infrared scanner data during cryogenic loading of the vehicle followed by on-pad visual inspection. High speed photography was analyzed after launch to identify ice/debris sources and evaluate potential vehicle damage and/or in-flight anomalies. This report documents the debris/ice/TPS conditions and integrated photographic analysis of Shuttle mission STS-55, and the resulting effect on the Space Shuttle Program. Author

APU DIAPHRAGM TESTING. TEST PLAN
Richard Shelley (Lockheed Engineering and Management Services Co., Inc., Las Cruces, NM.) 14 Jan. 1992 14 p Sponsored by NASA. Johnson Space Center
(NASA-TM-108251; TP-WSTF-682; NAS 1.15:108251) Avail: CASI HC A03/MF A01

Auxiliary Power Unit (APU) fuel (hydrazine) tanks have had to be removed from the Columbia Shuttle (OV-102) because they have been in service for 11 years, which is the limit of their useful life. As part of an effort to determine whether the useful life of the fuel tanks can be extended, examination of the ethylene propylene rubber (EPR) diaphragm and the metal from one of the APU tanks is required. The JSC Propulsion and Power Division has requested White Sands Test Facility (WSTF) to examine the EPR diaphragm thoroughly and the metal casing generally from one

tank. The objective is to examine the EPR diaphragm for signs of degradation that may limit the life of its function in the APU propellant tank. The metal casing will also be examined for signs of surface corrosion.

APU DIAPHRAGM TESTING
Richard Shelley (Lockheed Engineering and Sciences Co., Houston, TX.) and William L. Ross, Sr. (Lockheed Engineering and Sciences Co., Houston, TX.) 1 Mar. 1993 107 p Original contains color illustrations
(NASA-TM-108254; NAS 1.15:108254; TR-682-001) Avail: CASI HC A06/MF A02; 29 functional color pages

The Auxiliary Power Unit (APU) fuel (hydrazine) tanks were removed from the Columbia Shuttle during major modification of the vehicle, because of long-term hydrazine compatibility concerns. The three tanks had been in service for 11 years. As part of an effort to determine whether the useful life of the fuel tanks can be extended, examination of the ethylene propylene rubber (EPR) diaphragm and the metal casing from one of the APU tanks was required. NASA Johnson Space Center Propulsion and Power Division requested the NASA Johnson Space Center White Sands Test Facility to examine the EPR diaphragm for signs of degradation that might limit the life of its function in the APU tank and to examine the metal casing for signs of surface corrosion. No appreciable degradation of the EPR diaphragm was noted. A decrease in the tensile properties was found, but tensile failure is considered unlikely because the metal casing constrains the diaphragm, preventing it from elongating more than a few percent. The titanium casing showed no evidence of surface corrosion.

POSTFLIGHT HARDWARE EVALUATION 360T025 (RSRM-25, STS-46) Final Report
Ferral Morgan Mar. 1993 32 p
(Contract NAS8-38100)
(NASA-CR-192562; NAS 1.26:192562; TWR-60699) Avail: CASI HC A03/MF A01

The final report for the Clearfield disassembly evaluation and a continuation of the KSC postflight assessment for the 360T025 (STS-46) Redesign Solid Rocket Motor (RSRM) flight set is presented. All observed hardware conditions were documented on PFOR's and are included in Appendices A through C. Appendices D and E contain the measurements and safety factor data for the nozzle and insulation components. Along with the KSC Ten-Day Postflight Hardware Evaluation Report (TWR-60687), a summary of the 360T025 hardware evaluation is provided. The as-flown hardware configuration is documented in TWR-60470. Disassembly evaluation photograph numbers are logged in TWA-1986. The 360T025 flight set disassembly evaluations described were performed at the RSRM Refurbishment Facility in Clearfield, Utah. The final factory joint demate occurred on 16 Mar. 1993. Detailed evaluations were performed in accordance with the Clearfield PEEP, TWR-50051, Revision A. All observations were compared against limits that are also defined in the PEEP. These limits outline the criteria for categorizing the observations as acceptable, reportable, or critical. Hardware conditions that were unexpected and/or determined to be reportable or critical were evaluated by the applicable CPT and tracked through the PFAR system. Author (revised)

A REPRESENTATIVE SURVEY OF US SPACE SYSTEMS AND METHODS FOR ESTIMATING THEIR COSTS Final Report, Apr. 1991 - Nov. 1992
J. R. Nelson, James Bui, Mitchell S. Robinson, Jennifer A. Titus, and Stephen K. Welman Nov. 1992 185 p
(AD-A264159; IDA-D-1182; IDA/HQ-92-41994; AD-E501645) Avail: CASI HC A09/MF A02

The purpose of this project was to expand and enhance IDA's capabilities to estimate the future acquisition costs and schedules of space systems. This study accumulated information on launch systems, manned space systems, and interplanetary systems from NASA. Cost and schedule information was collected on representative programs, estimating methods, and supporting databases. The results of the effort include this document, which summarizes costs and schedules of representative space systems along with cost-estimating methods currently being applied, and also a library of over 500 documents that describe technical, schedule, and cost characteristics of U.S. space activities during the past 40 years. Preliminary findings of this study have been applied to estimate the costs of manned access to space.

SHUTTLE LANDING FACILITY CLOUD COVER STUDY: CLIMATOLOGICAL ANALYSIS AND TWO TENTHS CLOUD COVER RULE EVALUATION
Michael K. Atchison, Robin Schumann, Greg Taylor, John Warburton, Mark Wheeler, and Ann Yersavich May 1993 199 p
(Contract NAS10-11844)
(NASA-CR-193016; NAS 1.26:193016; Rept-93-001) Avail: CASI HC A09/MF A03

The two-tenths cloud cover rule in effect for all End Of Mission (EOM) STS landings at the Kennedy Space Center (KSC) states: 'for scattered cloud layers below 10,000 feet, cloud cover must be observed to be less than or equal to 0.2 at the de-orbit burn go/no-go decision time (approximately 90 minutes before landing time)'. This rule was designed to protect against a ceiling (below 10,000 feet) developing unexpectedly within the next 90 minutes (i.e., after the de-orbit burn decision and before landing). The Applied Meteorological Unit (AMU) developed and analyzed a database of cloud cover amounts and weather conditions at the Shuttle

Landing Facility for a five-year (1986-1990) period. The data indicate the best time to land the shuttle at KSC is during the summer while the worst time is during the winter. The analysis also shows the highest frequency of landing opportunities occurs for the 0100-0600 UTC and 1300-1600 UTC time periods. The worst time of the day to land a shuttle is near sunrise and during the afternoon. An evaluation of the two-tenths cloud cover rule for most data categorizations has shown that there is a significant difference in the proportions of weather violations one and two hours subsequent to initial conditions of 0.2 and 0.3 cloud cover. However, for May, Oct., 700 mb northerly wind category, 1500 UTC category, and 1600 UTC category there is some evidence that the 0.2 cloud cover rule may be overly conservative. This possibility requires further investigation. As a result of these analyses, the AMU developed nomograms to help the Spaceflight Meteorological Group (SMG) and the Cape Canaveral Forecast Facility (CCFF) forecast cloud cover for EOM and Return to Launch Site (RTLS) at KSC. Future work will include updating the two tenths database, further analysis of the data for several categorizations, and developing a proof of concept artificial neural network to provide forecast guidance of weather constraint violations for shuttle landings. (NASA-TM-106217; E-7928; NAS 1.15:106217) Avail: CASI HC A02/MF A01

The system requirements and hardware implementation for electromagnetic compensation of antenna performance degradations due to thermal effects was investigated. Future commercial space communication antenna systems will utilize the 20/30 GHz frequency spectrum and support very narrow multiple beams (0.3 deg) over wide angle field of view (15-20 beamwidth). On the ground, portable and inexpensive very small aperture terminals (VSAT) for transmitting and receiving video, facsimile and data will be employed. These types of communication system puts a very stringent requirement on spacecraft antenna beam pointing stability (less than .01 deg), high gain (greater than 50 dB) and very lowside lobes (less than -25 dB). Thermal analysis performed on the advanced communication technology satellite (ACTS) has shown that the reflector surfaces, the mechanical supporting structures and metallic surfaces on the spacecraft body will distort due thermal effects from a varying solar flux. The antenna performance characteristics (e.g., pointing stability, gain, side lobe, etc.) will degrade due to thermal distortion in the reflector surface and supporting structures. Specifically, antenna RF radiation analysis has shown that pointing error is the most sensitive antenna performance parameter to thermal distortions. Other antenna parameters like peak gain, cross polarization level (beam isolation), and side lobe level will also degrade with thermal distortions. In order to restore pointing stability and in general antenna performance several compensation methods were proposed. In general these compensation methods can be classified as being either of mechanical or electromagnetic type. This paper will address only the later one. In this approach an adaptive phased array antenna feed is used to compensate for the antenna performance degradation. Extensive work has been devoted to demonstrate the feasibility of adaptive feed compensation on space communication antenna systems. This paper addresses the system requirements for such a system and identify candidate technologies (analog and digital) for possible hardware implementation. Author (revised)

SPREE INTERACTIVE DATA ANALYSIS TOOL (SIDAT)
C. J. Roth and N. A. Bonito 30 Oct. 1992 34 p
(AD-A262782; RXR-92101; PL-TR-92-2331; SR-6) Avail: CASI HC A03/MF A01

The SPREE Interactive Data Analysis Tool (SIDAT) is a collection of user-friendly display processes for performing real-time and postflight analysis of data from the Shuttle Potential and Return Electron Experiment (SPREE). SPREE was used to study the effects of a potential being induced between a tethered satellite and the Shuttle by the motion of the conductive tether across the Earth's magnetic field lines. Full-color raster graphics and text displays were used for the data presentation, utilizing the X11 and XView X Window System libraries. The SIDAT data display processes allowed the SPREE data and other related data to be viewed in a variety of formats simultaneously. During flight, SIDAT displayed the current or previously captured real-time SPREE telemetry data. SIDAT postflight operations allow the user to perform rapid data survey for analysis. The user specified the times for data survey, displaying either the captured real-time SPREE telemetry data or the SPREE data archived by the Flight Data Recorders. DTIC

ON-BOARD B-ISDN FAST PACKET SWITCHING ARCHITECTURES. PHASE 2: DEVELOPMENT. PROOF-OF-CONCEPT ARCHITECTURE DEFINITION REPORT Final Report
Dong-Jye Shyy and Wayne Redman Jun. 1993 126 p
(Contract NASw-4711; RTOP 506-72-21)
(NASA-CR-191151; E-7931; NAS 1.26:191151) Avail: CASI HC A07/MF A02

For the next-generation packet switched communications satellite system with onboard processing and spot-beam operation, a reliable onboard fast packet switch is essential to route packets from different uplink beams to different downlink beams. The rapid emergence of point-to-point services such as video distribution, and the large demand for video conference, distributed data processing, and network management makes the multicast function essential to a fast packet switch (FPS). The satellite's inherent broadcast features gives the satellite network an advantage over the terrestrial network in providing multicast services. This report evaluates alternate multicast FPS architectures for onboard baseband switching applications and selects a candidate for subsequent breadboard development. Architecture evaluation and selection will be based on the study performed in phase 1, 'Onboard B-ISDN Fast Packet Switching Architectures', and other switch architectures which have become commercially available as large scale integration (LSI) devices. THE DYNAMICS AND CONTROL OF SPACE TETHERS Ph.D. Thesis
Kurt Voigt Crowder 1992 228 p
Avail: Univ. Microfilms Order No. DA9307210

The dynamics of swinging and spinning space tethered systems are examined, the effects of rapidly spinning tethered systems on their orbit are determined, the phase space positions of unstable and chaotic motion are located, and methods for controlling space tethered systems by manipulating the length and tension of the tether are studied. The dynamics of a system connected by a massless tether are studied. Instabilities are sought for motions corresponding to large librations and rotations in the plane of the orbit. Out of plane instabilities are found for both swinging and spinning motions. The equation for out of plane motion takes the form of Hill's equation, which is well approximated by Mathieu's equation. Instabilities are found from stability charts. The predicted locations of instabilities was checked by integrating the equations of motion numerically and projecting the resulting curves onto one plane to obtain Lissajous plots. Massive tethers are considered. The normal modes of departures from a straight tether were determined. The stability of these modes was analyzed using Mathieu charts. Orbital perturbations are considered. A rapidly spinning tether was assumed. Lagrange's Planetary Equations were solved to find that the size, shape, and inclination of the orbit were unaffected by the tethered system, however, the nodal angle and the argument of periapse were found to precess. A 416km tether could be used to cancel the regression of nodes due to J(sub 2) effects. This method could be used to stabilize orbits with arbitrary inclinations, and could prove useful for many projects, including, for example, a tether mediated low earth orbit to moon transport system. Control laws for spin up, spin down, and reel in are obtained. A method for suppressing out of plane oscillations through parametric damping is also demonstrated. The control methods derived are applied to a numerical model for a massive tether. Most of the control methods stimulate oscillations in the shape of the tether. A method for parametrically damping these oscillations was demonstrated with modest success. The need exists for improved methods to suppress the shape oscillations. Author (revised)

SPACE STATION: ORBITER BERTHING
J. Mapar, Y. C. Lin, and M. Kilby 27 Jan. 1992 33 p
Avail: CASI HC A03/MF A01

The berthing/docking maneuver is important for the construction and assembly of the Space Station Freedom (SSF). Berthing has a direct effect on the SSF assembly build up and SSF/Orbiter operations. The dynamics associated with the berthing activities potentially large impacts on the elements ans systems (both the Orbiter and SSF) throughout the assembly sequence. These dynamics will play a major role in the development of operational requirements that need to be identified and validated in order to assure total safety and maneuver execution during the SSF construction. The berthing/docking task will consider those assembly flights where the SSF has the control authority for the combined stack (currently MB-5) and beyond. The purpose of this task is to analyze the effects of berthing dynamics and their impacts on the maneuver and operational requirements. The task objectives are the following: (1) to develop the necessary analytical tool(s) and skills that will enable the verification and certification of berthing/docking for each assembly flight; (2) to perform detailed analyses of the berthing/docking maneuvers during the SSF assembly buildup in order to verify the viability of such maneuvers; and (3) to develop the operational requirements that affect such maneuvers and establish the operational boundaries and envelops for berthing/docking during assembly and mature operations. Various topics are presented in viewgraph form and include the following: analysis tools and capabilities; analysis results; and ongoing work. Derived from text

Avail: CASI HC A01/MF A01

Deployment and assembly of large structures in orbit is a critical technology to the overall problem of orbital construction. The attendant large configuration changes of structures will cause significant changes in the dynamic characteristics of the entire system, and perturbation to the orbital dynamics of the spacecraft from which the structures are deployed and/or assembled. To better design structures for deployment and assembly, and to better design controlled deployment/assembly processes, accurate modeling techniques are absolutely essential. The problem of modeling the dynamics of deploying and retrieving beam-like structures from a rotating base was addressed. A methodology for discrete modeling, and a computational procedure were developed. These results give us the capability of understanding and predicting the effects on the overall satellite motion of deploying flexible appendages. This is an initial step towards a general capability of treating axially moving three-dimensional beams. The interaction dynamics of the orbiter, its flexible manipulator, and the structures to be assembled/deployed, as a prerequisite in order to simulate incremental in-space structural construction processes are investigated. Preliminary results so obtained indicate that, as the inertia properties of the flexible large space structure under construction change during the space assembly/construction process, the interaction dynamics undergo significant changes in their characteristics, thus revealing the need for a variety of control strategies throughout construction. HYBRID CMS METHODS WITH MODEL REDUCTION FOR ASSEMBLY OF STRUCTURES
Charbel Farhat *In its* Space Construction Activities 1 Nov. 1991 p 8-9 (For primary document see N93-29108 11-18)
Avail: CASI HC A01/MF A01

Future on-orbit structures will be designed and built in several stages, each with specific control requirements. Therefore there must be a methodology which can predict the dynamic characteristics of the assembled structure, based on the dynamic characteristics of the subassemblies and their interfaces. The methodology developed by CSC to address this issue is Hybrid Component Mode Synthesis (HCMS). HCMS distinguishes itself from standard component mode synthesis algorithms in the following features: (1) it does not require the subcomponents to have displacement compatible models, which makes it ideal for analyzing the deployment of heterogeneous flexible multibody systems, (2) it incorporates a second-level model reduction scheme at the interface, which makes it much faster than other algorithms and therefore suitable for control purposes, and (3) it does answer specific questions such as 'how does the global fundamental frequency vary if I change the physical parameters of substructure k by a specified amount?'. Because it is based on an energy principle rather than displacement compatibility, this methodology can also help the designer to define an assembly process. Current and future efforts are devoted to applying the HCMS method to design and analyze docking and berthing procedures in orbital construction. Author (revised)

CONTROLS OF INTERACTION DYNAMICS OF ORBITAL ASSEMBLY
Renjeng Su *In its* Space Construction Activities 1 Nov. 1991 p 10-15 (For primary document see N93-29108 11-18)
Avail: CASI HC A02/MF A01

Building structures and spacecraft in orbit will require technologies for positioning, docking/berthing, and joining orbital structures. A fundamental problem underlying the operation of docking and berthing is that of controlling the contact dynamics of mechanical structures actuated by active mechanisms such as robotic devices. Control systems must be designed to control these active mechanisms so that both the free space motions and contact motions are stable and satisfy specifications on position accuracy and bounds on contact forces. For the large orbital structures of the future, the problem of interactive dynamics and control is fundamentally different in several ways than it was for spacecraft docking in the past. First, future space structures must be treated as flexible structures - the operations of docking, berthing, and assembly will need to respect the vibrations of the structures. Second, the assembly of these structures will require multiple-point contact, rather than the essentially single-point positioning of conventional spacecraft docking. Third, some assembly operations require the subassemblies to be brought and held in contact so that successful joining can be accomplished. A preliminary study of contact stability and compliance control design has resulted in the development of an analytical method and a design method to analyze stability. The analytical method analyzes the problem of stability when an actively-controlled structure contacts a passive structure. This method makes it possible to accurately estimate the stiffness of the passive structures with which the contact motion will become unstable. The analytic results suggest that passivity is neither achievable in practice, nor necessary as a design concept. A contact control system need only be passive up to a certain frequency; beyond that frequency the system can be stabilized with sufficiently small gains. With this concept the Center developed a design methodology for achieving desired compliant contact motions. This design method is based on H-infinity norm optimization, which makes it possible to consider both driving point mechanical impedance and systems robustness to modeling uncertainty. A laboratory facility was set up to verify experimentally the analytical and design theory. Author (revised)

CONTROLS FOR SPACE STRUCTURES
Mark Balas *In its* Space Construction Activities 1 Nov. 1991 p 16-19 (For primary document see N93-29108 11-18)
Avail: CASI HC A01/MF A01

Assembly and operation of large space structures (LSS) in orbit will require robot-assisted docking and berthing of partially-assembled structures. These operations require new solutions to the problems of controls. This is true because of large transient and persistent disturbances, controller-structure interaction with unmodeled modes, poorly known structure parameters, slow actuator/sensor dynamical behavior, and excitation of nonlinear structure vibrations during control and assembly. For on-orbit assembly, controllers must start with finite element models of LSS and adapt on line to the best operating points, without compromising stability. This is not easy to do, since there are often unmodeled dynamic interactions between the controller and the structure. The indirect adaptive controllers are based on parameter estimation. Due to the large number of modes in LSS, this approach leads to very high-order control schemes with consequent poor stability and performance. In contrast, direct model reference adaptive controllers operate to force the LSS to track the desirable behavior of a chosen model. These schemes produce simple control algorithms which are easy to implement on line. One problem with their use for LSS has been that the model must be the same dimension as the LSS - i.e., quite large. A control theory based on the command generator tracker (CGT) ideas of Sobel, Mabins, Kaufman and Wen, Balas to obtain very low-order models based on adaptive algorithms was developed. Closed-loop stability for both finite element models and distributed parameter models of LSS was proved. In addition, successful numerical simulations on several LSS databases were obtained. An adaptive controller based on our theory was also implemented on a flexible robotic manipulator at Martin Marietta Astronautics. Computation schemes for controller-structure interaction with unmodeled modes, the residual mode filters or RMF, were developed. The RMF theory was modified to compensate slow actuator/sensor dynamics. These new ideas are being applied to LSS simulations to demonstrate the ease with which one can incorporate slow actuator/sensor effects into our design. It was also shown that residual mode filter compensation can be modified for small nonlinearities to produce exponentially stable closed-loop control. A theory for disturbance accommodating controllers based on reduced order models of structures was developed, and stability results for these controllers in closed-loop with large-scale finite element models of structures were obtained. STRUCTURAL LOAD CONTROL DURING CONSTRUCTION
Martin M. Mikulas, Jr. *In its* Space Construction Activities 1 Nov. 1991 p 20-22 (For primary document see N93-29108 11-18)
Avail: CASI HC A01/MF A01

In the absence of gravitational pull, the major design considerations for large space structures are stiffness for controllability, and transient dynamic loadings (as opposed to the traditional static load associated with earth-based structures). Because of the absence of gravitational loading, space structures can be designed to be significantly lighter than their counterparts on Earth. For example, the Space Shuttle manipulator arm is capable of moving and positioning a 60,000 lb payload, yet weighs less than 1,000 lbs. A recent design for the Space Station which had a total weight of about 500,000 lbs. used a primary loadcarrying keel beam which weighed less than 10,000 lbs. For many large space structures designs it is quite common for the load-carrying structure to have a mass fraction on the order of one or two percent of the total spacecraft mass. This significant weight reduction for large space structures is commonly accompanied by very low natural frequencies. These low frequencies cause an unprecedented level of operational complexity for mission applications which require a high level of positioning and control accuracy. This control problem is currently the subject of considerable research directed towards reducing the flexibility problem. In addition, however, the small mass fraction typically results in structures which are quite unforgiving to inadvertent high loadings. In other words, the structures are 'fragile.' In order to deal with the fragility issue CSC developed a load-limiting concept for space truss structures. This concept is aimed at limiting the levels of load which can occur in a large space structure during the construction process as well as during subsequent operations. Currently, the approach for dealing with large loadings is to make the structure larger. The impact this has on construction is significant. The larger structures are more difficult to package in the launch vehicle, and in fact in some instances the concept must be changed from a deployable truss to an erectable truss to permit packaging. The new load-limiting concept is aimed at permitting the use in large space structures of smaller trusses with a high level of strength robustness, in order to simplify the construction process. To date several analyses conducted on the concept have demonstrated its feasibility, and an experiment is currently being designed to demonstrate its operation. Author

SYSTEMS ENGINEERING STUDIES OF ON-ORBIT ASSEMBLY OPERATION
George W. Morgenthaler *In its* Space Construction Activities 1 Nov.

1991 p 23-26 (For primary document see N93-29108 11-18)
Avail: CASI HC A01/MF A01

While the practice of construction has a long history, the underlying theory of construction is relatively young. Very little has been documented as to techniques of logistic support, construction planning, construction scheduling, construction testing, and inspection. The lack of 'systems approaches' to construction processes is certainly one of the most serious roadblocks to the construction of space structures. System engineering research efforts at CSC are aimed at developing concepts and tools which contribute to a systems theory of space construction. The research is also aimed at providing means for trade-offs of design parameters for other research areas in CSC. Systems engineering activity at CSC has divided space construction into the areas of orbital assembly, lunar base construction, interplanetary transport vehicle construction, and Mars base construction. A brief summary of recent results is given. Several models for 'launch-on-time' were developed. Launch-on-time is a critical concept to the assembly of such Earth-orbiting structures as the Space Station Freedom, and to planetary orbiters such as the Mars transfer vehicle. CSC has developed a launch vehicle selection model which uses linear programming to find optimal combinations of launch vehicles of various sizes (Atlas, Titan, Shuttles, HLLV's) to support SEI missions. Recently, the Center developed a cost trade-off model for studying on orbit assembly logistics. With this model it was determined that the most effective size of the HLLV would be in the range of 120 to 200 metric tons to LEO, which is consistent with the choices of General Stafford's Synthesis Group Report. A second-generation Dynamic Construction Activities Model ('DYCAM') process model has been under development, based on our past results in interruptability and our initial DYCAM model. This second-generation model is built on the paradigm of knowledge-based expert systems. It is aimed at providing answers to two questions: (1) what are some necessary or sufficient conditions for judging conceptual designs of spacecraft?, and (2) can a methodology be formulated such that these conditions may be used to provide computer-aided tools for evaluating conceptual designs and planning for space assembly sequences? Early simulation results indicate that the DYCAM model has a clear ability to emulate and simulate human orbital construction processes. Author (revised)

LUNAR REGOLITH DENSIFICATION **c91**
Hon-Yim Ko and Stein Sture *In its* Space Construction Activities 1 Nov. 1991 p 28-30 (For primary document see N93-29108 11-18)
Avail: CASI HC A01/MF A01

Core tube samples of the lunar regolith obtained during the Apollo missions showed a rapid increase in the density of the regolith with depth. Various hypotheses have been proposed for the possible cause of this phenomenon, including the densification of the loose regolith material by repeated shaking from the seismic tremors which have been found to occur at regular monthly intervals when the moon and earth are closest to one another. A test bed was designed to study regolith densification. This test bed uses Minnesota Lunar Simulant (MLS) to conduct shaking experiments in the geotechnical centrifuge with an inflight shake table system. By reproducing realistic in-situ regolith properties, the experiment also serves to test penetrator concepts. The shake table system was designed and used for simulation experiments to study effects of earthquakes on terrestrial soil structures. It is mounted on a 15 g-ton geotechnical centrifuge in which the self-weight induced stresses are replicated by testing an n-th scale model in a gravity field which is n times larger than Earth's gravity. A similar concept applies when dealing with lunar prototypes, where the gravity ratio required for proper simulation of lunar gravity effects is that between the centrifugal acceleration and the lunar gravity. Records of lunar seismic tremors, or moonquakes, were obtained. While these records are being prepared for use as the input data to drive the shake table system, records from the El Centro earthquake of 1940 are being used to perform preliminary tests, using a soil container which was previously used for earthquake studies. This container has a laminar construction, with the layers free to slide on each other, so that the soil motion during the simulated earthquake will not be constrained by the otherwise rigid boundaries. The soil model is prepared by pluviating the MLS from a hopper into the laminar container to a depth of 6 in. The container is mounted on the shake table and the centrifuge is operated to generate an acceleration of 10 times Earth's gravity or 60 times the lunar gravity, thus simulating a lunar regolith thickness of 30 ft. The shake table is then operated using the scaled 'moonquake' as the input motion. One or more model moonquakes are used in each experiment, after which the soil is analyzed for its density profile with depth. This is accomplished by removing from the soil bed a column of soil contained within a thin rubber sleeve which has been previously embedded vertically in the soil during pluviation. This column of soil is transferred to a gamma ray device, in which the gamma ray transmission transversely through the soil is measured and compared with standard calibration samples. In this manner, the density profile can be determined. Preliminary results to date are encouraging, and the Center plans to study the effects of duration of shaking, intensity of the shaking motion, and the frequency of the motion. Author (revised)

REGOLITH-STRUCTURE MODELING **c91**
Hon-Yim Ko and Stein Sture *In its* Space Construction Activities 1 Nov. 1991 p 31-35 (For primary document see N93-29108 11-18)
Avail: CASI HC A01/MF A01

Early lunar missions have provided a basic understanding of the physical and strength properties of lunar regolith, which have been shown to differ from those of dry terrestrial granular soils. Lunar regolith is predominantly a fine sand of which nearly 40 percent can be characterized as silt with a particle size smaller than 100 micrometers. The top 10 to 20 cm of the regolith can be characterized as being in a loose to medium-loose state. The density of the regolith, however, rapidly increases below a depth of 20 cm. The highly irregular and angular shapes of the regolith particles tend to interlock and create relatively strong mechanical bonds that give the particulate mass substantial cohesive properties and smaller amounts of tensile strength properties. In addition, the friction angle of lunar regolith at medium to high densities is quite high and often exceeds 55 degrees. These known properties of lunar regolith have been matched in a terrestrially-manufactured analog known as Minnesota Lunar Simulant. A variety of experiments were conducted using this simulant to both verify existing information and generate new information on the physical and constitutive properties of lunar regolith. These experiments include maximum and minimum density determinations, specific mass of solids, grain-size distribution, conventional triaxial compression and extension, isotropic compression, one-dimensional compression, direct shear, and direct tension. Direct shear experiments were conducted under atmospheric and vacuum conditions. Results of the physical and strength experiments compare closely to results obtained from lunar missions. Results of simulant strength experiments performed in vacuum indicated no observable difference from results obtained in air. A test bed currently under study is one involving a regolith shield covering a first-generation human habitat module. It is understood that regolith in depths ranging from 3 to 5 meters is required for radiation shielding for habitation and workspace. The habitat module is treated as a rigid cylindrical tube with a smooth exterior. By making the cylinder rigid, a complex interaction problem is reduced to a situation where we can consider the support regolith and the shielding regolith as behaving independently of the structural properties of the cylindrical structure. Medium-dense lunar simulant was placed around a scaled model of the habitat module to provide a radiation shield. This embankment-type shield was constructed in relatively thin but fine layers by compacting, by mechanical vibratory means, layer upon layer of simulant placed adjacent to the horizontally-aligned cylinder. The slope angles were constructed at 55 degrees. The model described above was studied in a geotechnical centrifuge, which allows for the scaling of model dimensions to prototype dimensions by increasing the acceleration of gravity on the model. The deformation response can be scaled up to prototype dimensions to provide an assessment of the deformation patterns of the lunar structure. The actual process of local and/or global growth of instabilities or skip planes can also be observed. Author (revised)

LUNAR REGOLITH PENETRATORS AND CUTTERS **c91**
Frank Barnes and Stein Sture *In its* Space Construction Activities 1 Nov. 1991 p 36-37 (For primary document see N93-29108 11-18)
Avail: CASI HC A01/MF A01

An apparatus was designed and built for conducting simulation experiments on cutting tool penetration in the centrifuge. This equipment is mounted on the laminar container which is used for the regolith densification study, so that the end product of the latter, i.e., a regolith bed with the proper density profile, can be used directly for the penetration tests. In this apparatus, an etching tool is suspended through a pulley system by the action of a double acting air cylinder. By adjusting the air pressure acting on each side of the cylinder, the net downward force acting on the tool can be controlled. The penetration of the tool is measured by an LVDT. This apparatus was proof-tested in the centrifuge and is ready for use in conjunction with the regolith densification experiments.

LUNAR CRANE SYSTEM c37

Martin M. Mikulas, Jr. *In its* Space Construction Activities 1 Nov. 1991 p 38-41 (For primary document see N93-29108 11-18)

Avail: CASI HC A01/MF A01

In many lunar construction scenarios, mechanical cranes in some form will be indispensible in moving large masses around with various degrees of fine positioning. While thorough experience exists in the use of terrestrial cranes new thinking is required about the design of cranes to be used in extraterrestrial construction. The primary driving force for this new thinking is the need to automate the crane system so that space cranes can be operated as telerobotic machines with a large number of automatic capabilities. This is true because in extraterrestrial construction human resources will need to be critically rationed. The design problems of mechanisms and control systems for a lunar crane must deal with at least two areas of performance. First, the automated crane must be capable of maneuvering a large mass, so that when the mass arrives at the target position there are only small vibrations. Secondly, any residue vibrations must be automatically damped out and a fine positioning must be achieved. For extraterrestrial use there are additional challenges to a crane design - for example, to design a crane system so that it can be transformed for other construction uses. This initial project in crane design does not address such additional issues, although they may be the subject of future CSC research. To date the Center has designed and analyzed many mechanisms. The fundamental problem of trade-offs between passively stabilizing the load and actively controlling the load by actuators was extensively studied. The capability of 3D dynamics modeling now exists for such studies. A scaled model of a lunar crane was set up and it has been most fruitful in providing basic understanding of lunar cranes. Due to an interesting scaling match-up, this scaled model exhibits the load vibration frequencies one would expect in the real lunar case. Using the analytical results achieved to date, a laboratory crane system is now being developed as a test bed for verifying a wide variety of mechanisms and control designs. Future development will be aimed at making the crane system a telerobotic test bed into which external sensors such as computer vision systems, and other small robotic devices such as CSC lunar rovers, will be integrated.

LUNAR ROVERS AND LOCAL POSITIONING SYSTEM c37

James Avery and Renjeng Su *In its* Space Construction Activities 1 Nov. 1991 p 42-45 (For primary document see N93-29108 11-18)

Avail: CASI HC A01/MF A01

Telerobotic rovers equipped with adequate actuators and sensors are clearly necessary for extraterrestrial construction. They will be employed as substitutes for humans, to perform jobs like surveying, sensing, signaling, manipulating, and the handling of small materials. Important design criteria for these rovers include versatility and robustness. They must be easily programmed and reprogrammed to perform a wide variety of different functions, and they must be robust so that construction work will not be jeopardized by parts failures. The key qualities and functions necessary for these rovers to achieve the required versatility and robustness are modularity, redundancy, and coordination. Three robotic rovers are being built by CSC as a test bed to implement the concepts of modularity and coordination. The specific goal of the design and construction of these robots is to demonstrate the software modularity and multirobot control algorithms required for the physical manipulation of constructible elements. Each rover consists of a transporter platform, bus manager, simple manipulator, and positioning receivers. These robots will be controlled from a central control console via a radio-frequency local area network (LAN). To date, one prototype transporter platform frame was built with batteries, motors, a prototype single-motor controller, and two prototype internal LAN boards. Software modules were developed in C language for monitor functions, i/o, and parallel port usage in each computer board. Also completed are the fabrication of half of the required number of computer boards, the procurement of 19.2 Kbaud RF modems for inter-robot communications, and the simulation of processing requirements for positioning receivers. In addition to the robotic platform, the fabrication of a local positioning system based on infrared signals is nearly completed. This positioning system will make the rovers into a moving reference system capable of performing site surveys. In addition, a four degree mechanical manipulator especially suited for coordinated teleoperation was conceptually designed and is currently being analyzed. This manipulator will be integrated into the rovers as their end effector. Twenty internal LAN cards fabricated by a commercial firm are being used, a prototype manipulator and a range finder for a positioning system were built, a prototype two-motor controller was designed, and one of the robots is performing its first telerobotic motion. In addition, the robots' internal LAN's were coordinated and tested, hardware design upgrades based on fabrication and fit experience were completed, and the positioning system is running. The rover system is able to perform simple tasks such as sensing and signaling; coordination systems which allow construction tasks to begin were established, and soon coordinated teams of robots in the laboratory will be able to manipulate common objects.

INDIGENOUS LUNAR CONSTRUCTION MATERIALS c31

Wayne P. Rogers and Stein Sture *In its* Space Construction Activities 1 Nov. 1991 p 46-50 (For primary document see N93-29108 11-18)

Avail: CASI HC A01/MF A01

The utilization of local resources for the construction and operation of a lunar base can significantly reduce the cost of transporting materials and supplies from Earth. The feasibility of processing lunar regolith to form construction materials and structural components is investigated. A preliminary review of potential processing methods such as sintering, hot-pressing, liquification, and cast basalt techniques, was completed. The processing method proposed is a variation on the cast basalt technique. It involves liquification of the regolith at 1200-1300 C, casting the liquid into a form, and controlled cooling. While the process temperature is higher than that for sintering or hot-pressing (1000-1100 C), this method is expected to yield a true engineering material with low variability in properties, high strength, and the potential to form large structural components. A scenario for this processing method was integrated with a design for a representative lunar base structure and potential construction techniques. The lunar shelter design is for a modular, segmented, pressurized, hemispherical dome which could serve as habitation and laboratory space. Based on this design, estimates of requirements for power, processing equipment, and construction equipment were made. This proposed combination of material processing method, structural design, and support requirements will help to establish the feasibility of lunar base construction using indigenous materials. Future work will refine the steps of the processing method. Specific areas where more information is needed are: furnace characteristics in vacuum; heat transfer during liquification; viscosity, pouring and forming behavior of molten regolith; design of high temperature forms; heat transfer during cooling; recrystallization of basalt; and refinement of estimates of elastic moduli, compressive and tensile strength, thermal expansion coefficient, thermal conductivity, and heat capacity. The preliminary design of the lunar shelter showed us that joining is a critical technology needed for building a structure from large segments. The problem of joining is important to the design of any structure that is not completely prefabricated. It is especially important when the structure is subjected to tensile loading by an internal pressure. For a lunar shelter constructed from large segments the joints between these large segments must be strong, and they must permit automated construction. With a cast basalt building material which is brittle, there is the additional problem of connecting the joint with the material and avoiding stress concentration that would cause failure. Thus, a well-defined project which we intend to pursue during this coming year is the design of joints for cast basalt structural elements.

SYSTEMS ENGINEERING STUDIES OF LUNAR BASE CONSTRUCTION c31

George W. Morgenthaler *In its* Space Construction Activities 1 Nov. 1991 p 51 (For primary document see N93-29108 11-18)

Avail: CASI HC A01/MF A01

Many ingenious concepts have been proposed for lunar base construction, but few systematic studies exist which relate time-consistent lunar base construction technologies and the choice of lunar base approach with the long-term SEI objectives - i.e., lunar indigenous base construction and Mars Exploration equipment development. To fill this gap, CSC has taken a two-pronged approach. First, the Center undertook basic geotechnical investigations of lunar soil, fabrication of a scale prototype of a lunar construction crane, a multi-robot construction team laboratory experiment, and a preliminary design of lunar base structures. Second, during Jun. and Jul. 1991 two lunar base construction systems engineering studies were accomplished - a 'near term lunar base' study, and a 'far-term lunar base' study. The goals of these studies were to define the major lunar base construction research problems in consistent technology/construction frameworks, and to define design requirements for construction equipment such as a lunar crane and a regolith mover. The 'near-term lunar base' study examined three different construction concepts for a lunar base comprised of pre-fabricated, pre-tested, Space Station Freedom-type modules, which would be covered with regolith shielding. Concept A used a lunar crane for unloading and transportation; concept B, a winch and cart; and concept C, a walker to move the modules from the landing site to the base site and assemble them. To evaluate the merits of each approach, calculations were made of mass efficiency measure, source mass, reliability, far-term base mass, Mars base mass, and base assembly time. The model thus established was also used to define the requirements for crane speed and regolith mover m(sup 3)/sec rates. A major problem addressed is how to 'mine' the regolith and stack it over the habitats as shielding. To identify when the cost of using indigenous lunar materials to construct the base exceeds the cost of development and delivery of the equipment for processing lunar materials, a study of construction of a candidate sintered regolith 'far term lunar base' was undertaken. A technique was devised for casting slabs of sintered (basaltic) regolith and assembling these into a hemispherical (or geodesic) dome. The major problem occurs with the inner liner. At 14.7 psi and 20 percent oxygen internal atmosphere, the entire structure is in tension, even with the regolith load. Also, another study has indicated that at 14.7 psi major resupply of air will be needed because of leakage, and astronauts may have to engage in extensive pre-breathing and post-breathing for extravehicular activity (EVA) tasks, thus detracting from useful mission work time. An alternative is to operate part of the base at, say, 5 psi and 70 percent oxygen, or to equip the astronauts with hard suits at 8.3 psi or greater. All of these choices directly influence base design and construction techniques. Author (revised)

DESIGN OPTIMIZATION OF SPACE STRUCTURES

Carlos Felippa *In its* Space Construction Activities 1 Nov. 1991 p 52-54 (For primary document see N93-29108 11-18)
Avail: CASI HC A01/MF A01

The topology-shape-size optimization of space structures is investigated through Kikuchi's homogenization method. The method starts from a 'design domain block,' which is a region of space into which the structure is to materialize. This domain is initially filled with a finite element mesh, typically regular. Force and displacement boundary conditions corresponding to applied loads and supports are applied at specific points in the domain. An optimal structure is to be 'carved out' of the design under two conditions: (1) a cost function is to be minimized, and (2) equality or inequality constraints are to be satisfied. The 'carving' process is accomplished by letting microstructure holes develop and grow in elements during the optimization process. These holes have a rectangular shape in two dimensions and a cubical shape in three dimensions, and may also rotate with respect to the reference axes. The properties of the perforated element are obtained through an homogenization procedure. Once a hole reaches the volume of the element, that element effectively disappears. The project has two phases. In the first phase the method was implemented as the combination of two computer programs: a finite element module, and an optimization driver. In the second part, focus is on the application of this technique to planetary structures. The finite element part of the method was programmed for the two-dimensional case using four-node quadrilateral elements to cover the design domain. An element homogenization technique different from that of Kikuchi and coworkers was implemented. The optimization driver is based on an augmented Lagrangian optimizer, with the volume constraint treated as a Courant penalty function. The optimizer has to be especially tuned to this type of optimization because the number of design variables can reach into the thousands. The driver is presently under development. Author (revised)

THERMAL CERTIFICATION TESTS OF ORBITER THERMAL PROTECTION SYSTEM TILES COATED WITH KSC COATING SLURRIES

James D. Milhoan, Vuong T. Pham, and William D. Sherborne Apr. 1993 90 p
(NASA-TM-104766; JSC-26067; S-716; NAS 1.15:104766) Avail: CASI HC A05/MF A01

Thermal tests of Orbiter thermal protection system (TPS) tiles, which were coated with borosilicate glass slurries fabricated at Kennedy Space Center (KSC), were performed in the Radiant Heat Test Facility and the Atmospheric Reentry Materials & Structures Evaluation Facility at Johnson Space Center to verify tile coating integrity after exposure to multiple entry simulation cycles in both radiant and convective heating environments. Eight high temperature reusable surface insulation (HRSI) tiles and six low temperature reusable surface insulation (LRSI) tiles were subjected to 25 cycles of radiant heat at peaked surface temperatures of 2300 F and 1200 F, respectively. For the LRSI tiles, an additional cycle at peaked surface temperature of 2100 F was performed. There was no coating crack on any of the HRSI specimens. However, there were eight small coating cracks (less than 2 inches long) on two of the six LRSI tiles on the 26th cycle. There was practically no change on the surface reflectivity, physical dimensions, or weight of any of the test specimens. There was no observable thermal-chemical degradation of the coating either. For the convective heat test, eight HRSI tiles were tested for five cycles at a surface temperature of 2300 F. There was no thermal-induced coating crack on any of the test specimens, almost no change on the surface reflectivity, and no observable thermal-chemical degradation with an exception of minor slumping of the coating under painted TPS identification numbers. The tests demonstrated that KSC's TPS slurries and coating processes meet the Orbiter's thermal specification requirements. Author (revised)

TESTING IN COMBINED DYNAMIC ENVIRONMENTS

J. D. Rogers 1993 7 p Presented at the 14th Aerospace Testing Seminar, Manhattan Beach, CA, 9-11 Mar. 1993
(Contract DE-AC04-76DP-00789)
(DE93-010679; SAND-93-0090C; CONF-930391-2) Avail: CASI HC A02/MF A01

The combined dynamic environments of vibration and linear acceleration are experienced by a large number of spacecraft components and other devices. Testing such devices has normally been a two step process in which independent vibration and centrifuge tests were performed. There is a concern that combined effects from these two dynamic environments could cause unexpected operational failures which were not predicted from either analysis or the independent tests. This paper describes the design and performance of a testing facility which combines vibration and centrifuge testing in a single operation. The test facility is called the VIBRAFUGE and utilizes Sandia National Laboratory's 29 foot underground centrifuge with an attached electrodynamic shaker. Also addressed are activities underway at SNL on development of a combined vibration and acoustic test facility. DOE

SPACECRAFT SURFACE CHARGING HANDBOOK Final Report, Oct. 1989 - Nov. 1992
V. A. Davis and L. W. Gordon Nov. 1992 352 p
(Contract F19628-89-C-0209)
(AD-A262778; AD-E201436; PL-TR-92-2232; SSS-DPR-91-12305) Avail: CASI HC A16/MF A03

Spacecraft surface charging is the buildup of net electric charge - and therefore electrostatic potential - on the external surfaces of a spacecraft due to incident particles with energies in the kilo-electron volt to tens of kilo-electron volts range. Geosynchronous and low-altitude, polar-orbiting spacecraft encounter charging environments. Surface charging causes problems for operational spacecraft. A primary effect is the occurrence of electronic switching anomalies which can be triggered by differential charging related discharges. The discharge induced transients can cause system failures and potentially, material damage. A more common anomaly is a phantom command, requiring intervention from the ground, and possibly resulting in loss of data and/or expendables, thus shortening the operational lifetime of the spacecraft. The work of the early 1980's provided designers with tools to reduce the number and severity of anomalies. Over the past 10 years, concern has arisen regarding charging on low-altitude, polar orbiting spacecraft due to auroral precipitation. Additionally, with the miniaturization of components, modern spacecraft are more vulnerable to EMI. This handbook was developed to address some of these concerns. The scientific issues of concern in spacecraft surface charging are reviewed, the components of a spacecraft surface charging control plan are described, and the techniques used to avoid spacecraft surface charging problems are summarized. Examples are provided of (1) calculational techniques to evaluate the expected effects of a spacecraft design, and (2) experimental techniques to test immunity to spacecraft surface charging effects. Information on the environments found in the geosynchronous and auroral region and the surface material properties that can affect surfaces are also given. DTIC

ADVANCED EARTH OBSERVING SATELLITE (ADEOS)
[1993] 27 p In ENGLISH and JAPANESE Original contains color illustrations
Avail: CASI HC A03/MF A01

The objectives of the ADEOS mission are as follows: to acquire data on worldwide environmental changes such as the green house effect, ozone layer depletion, tropical rain forest deforestation, and abnormal climatic conditions; to contribute to international global environmental monitoring; and to further the development of platform bus technology, interorbital data relay technology, etc., which are necessary for the future earth observation systems. To make continuous, thorough observations of the entire earth's surface and its atmosphere, the spacecraft carries two core sensors: the Advanced Visible and Near Infrared Radiometer (AVNIR) and the Ocean Color and Temperature Sensor (OCTS). The two sensors were developed by NASDA. Additionally, the spacecraft carries six (6) Announcement of Opportunity (AO) sensors: the NASA Scatterometer (NSCAT) and Total Ozone Mapping Spectrometer (TOMS); the Polarization and Directionality of the Earth's Surface (POLDER) system; the Interferometric Monitor for Greenhouse Gases (IMG); the Improved Limb Atmospheric Spectrometer (ILAS); and the Retroreflector in Space (RIS). In early 1996, ADEOS will be launched into a sun synchronous sub-recurrent orbit at an altitude of approximately 797 km by an H-2 launcher. Derived from text

POWER BEAMING TO COMMUNICATION SATELLITES IN GEO
R. M. Morgan and R. J. Lipinski 1992 8 p Presented at the 1st Annual Wireless Power Transmission Conference, San Antonio, TX, 23-25 Feb. 1993
(Contract DE-AC04-76DP-00789)
(DE93-007608; SAND-92-1974C; CONF-930258-2) Avail: CASI HC A02/MF A01

Batteries normally provide power to geosynchronous satellites during earth eclipse 90 times each year, but the heavy charge-discharge cycle decreases their life expectancy. Battery life, and thus satellite life, could be extended by providing power during eclipses via laser illumination of the photovoltaic array. For a spin-stabilized satellite this would require 35 kill using an 8-m diameter transmission mirror (and 850-nm light) or 180 kW using a 3.5-m mirror. A 3-axis stabilized satellite has a larger span and requires an elongated spot to use a comparable laser. At present, 70 satellites are scheduled to be replaced by the year 2000 at a cost of almost $10 billion. Power beaming could save a substantial portion of this cost. Laser illumination also could augment solar power to increase the power available to new satellites. Increased power could boost the signal strength or allow more channels on the satellite. In addition, high-frequency channels (which require higher power to penetrate the atmosphere) could be used. Removal of waste heat from the satellite limits the amount of power that can be transmitted. Nevertheless, a spin-stabilized satellite with power beaming could generate 0.9 kill per square meter of the collector array, which is six times that of an equivalent conventional satellite using the same size solar panel. A 3-axis stabilized satellite could generate 0.6 kW/sq m (four times conventional). DOE

CONTROL OF NONLINEAR SYSTEMS WITH APPLICATIONS TO CONSTRAINED ROBOTS AND SPACECRAFT ATTITUDE STABILIZATION Abstract only
Hariharan Krishnan *In its* Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads 3 Jun. 1993 2 p (For primary document see N93-29988 11-18)
Avail: CASI HC A01/MF A02

This thesis is organized in two parts. In Part 1, control systems described by a class of nonlinear differential and algebraic equations are introduced. A procedure for local stabilization based on a local state realization is developed. An alternative approach to local stabilization is developed based on a classical linearization of the nonlinear differential-algebraic equations. A theoretical framework is established for solving a tracking problem associated with the differential-algebraic system. First, a simple procedure is developed for the design of a feedback control law which ensures, at least locally, that the tracking error in the closed loop system lies within any given bound if the reference inputs are sufficiently slowly varying. Next, by imposing additional assumptions, a procedure is developed for the design of a feedback control law which ensures that the tracking error in the closed loop system approaches zero exponentially for reference inputs which are not necessarily slowly varying. The control design methodologies are used for simultaneous force and position control in constrained robot systems. The differential-algebraic equations are shown to characterize the slow dynamics of a certain nonlinear control system in nonstandard singularly perturbed form. In Part 2, the attitude stabilization (reorientation) of a rigid spacecraft using only two control torques is considered. First, the case of momentum wheel actuators is considered. The complete spacecraft dynamics are not controllable. However, the spacecraft dynamics are small time locally controllable in a reduced sense. The reduced spacecraft dynamics cannot be asymptotically stabilized using continuous feedback, but a discontinuous feedback control strategy is constructed. Next, the case of gas jet actuators is considered. If the uncontrolled principal axis is not an axis of symmetry, the complete spacecraft dynamics are small time locally controllable. However, the spacecraft attitude cannot be asymptotically stabilized using continuous feedback, but a discontinuous stabilizing feedback control strategy is constructed. If the uncontrolled principal axis is an axis of symmetry, the complete spacecraft dynamics cannot be stabilized. However, the spacecraft dynamics are small time locally controllable in a reduced sense. The reduced spacecraft dynamics cannot be asymptotically stabilized using continuous feedback, but again a discontinuous feedback control strategy is constructed. Author

ATTITUDE STABILIZATION OF A RIGID SPACECRAFT USING TWO MOMENTUM WHEEL ACTUATORS

Hariharan Krishnan, N. Harris McClamroch, and Mahmut Reyhanoglu *In its* Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads 3 Jun. 1993 20 p (For primary document see N93-29988 11-18)
(Grant NSF MSS-91-14630)
Avail: CASI HC A03/MF A02

It is well known that three momentum wheel actuators can be used to control the attitude of a rigid spacecraft and that arbitrary reorientation maneuvers of the spacecraft can be accomplished using smooth feedback. If failure of one of the momentum wheel actuators occurs, it is demonstrated that two momentum wheel actuators can be used to control the attitude of a rigid spacecraft and that arbitrary reorientation maneuvers of the spacecraft can be accomplished. Although the complete spacecraft equations are not controllable, the spacecraft equations are small time locally controllable in a reduced nonlinear sense. The reduced spacecraft dynamics cannot be asymptotically stabilized to any equilibrium attitude using a time-variant continuous feedback control law, but discontinuous feedback control strategies are constructed which stabilize any equilibrium attitude of the spacecraft in finite time. Consequently, reorientation of the spacecraft can be accomplished using discontinuous feedback control. Author

NONLINEAR ATTITUDE CONTROL OF PLANAR STRUCTURES IN SPACE USING ONLY INTERNAL CONTROLS

Mahmut Reyhanoglu and N. Harris McClamroch (Michigan Univ., Ann Arbor.) *In* Michigan Univ., Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads 3 Jun. 1993 15 p (For primary document see N93-29988 11-18)
(Grant NSF MSS-91-14630)
Avail: CASI HC A03/MF A02

An attitude control strategy for maneuvers of an interconnection of planar bodies in space is developed. It is assumed that there are no exogeneous torques and that torques generated by joint motors are used as means of control so that the total angular momentum of the multibody system is a constant, assumed to be zero. The control strategy utilizes the nonintegrability of the expression for the angular momentum. Large angle maneuvers can be designed to achieve an arbitrary reorientation of the multibody system with respect to an inertial frame. The theoretical background for carrying out the required maneuvers is summarized. Author

ATTITUDE STABILIZATION OF A RIGID SPACECRAFT USING GAS JET ACTUATORS OPERATING IN A FAILURE MODE

Hariharan Krishnan, Mahmut Reyhanoglu, and Harris McClamroch *In its* Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads 3 Jun. 1993 6 p Presented at the Conference on Decision and Control, Tucson, AZ, 1992 (For primary document see N93-29988 11-18)
(Grant NSF MSS-91-14630)
Avail: CASI HC A02/MF A02

The attitude stabilization of a rigid spacecraft using control torques supplied by gas jet actuators about only two of its principal axes is considered. First, the case where the uncontrolled principal axis of the spacecraft is not an axis of symmetry is considered. In this case, the complete spacecraft dynamics are small time locally controllable. However, the spacecraft cannot be asymptotically stabilized to an equilibrium attitude using time-invariant continuous feedback. A discontinuous stabilizing feedback control strategy is constructed which stabilizes the spacecraft to an equilibrium attitude. Next, the case where the uncontrolled principal axis of the spacecraft is an axis of symmetry is considered. In this case, the complete spacecraft dynamics are not even accessible. However, the spacecraft dynamics are strongly accessible and small time locally controllable in a reduced sense. The reduced spacecraft dynamics cannot be asymptotically stabilized to an equilibrium attitude using time-invariant continuous feedback, but again a discontinuous stabilizing feedback control strategy is constructed. In both cases, the discontinuous feedback controllers are constructed by switching between one of several feedback functions. Author (revised)

PLANAR REORIENTATION OF A FREE-FREE BEAM IN SPACE USING EMBEDDED ELECTROMECHANICAL ACTUATORS **c39**

Ilya V. Kolmanovsky and N. Harris McClamroch *In its* Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads 3 Jun. 1993 12 p Presented at the SPIE Conference on Smart Structures and Materials, 1993 (For primary document see N93-29988 11-18)
(Grant NSF MSS-91-14630)
Avail: CASI HC A03/MF A02

It is demonstrated that the planar reorientation of a free-free beam in zero gravity space can be accomplished by periodically changing the shape of the beam using embedded electromechanical actuators. The dynamics which determine the shape of the free-free beam is assumed to be characterized by the Euler-Bernoulli equation, including material damping, with appropriate boundary conditions. The coupling between the rigid body motion and the flexible motion is explained using the angular momentum expression which includes rotatory inertia and kinematically exact effects. A control scheme is proposed where the embedded actuators excite the flexible motion of the beam so that it rotates in the desired sense with respect to a fixed inertial reference. Relations are derived which relate the average rotation rate to the amplitudes and the frequencies of the periodic actuation signal and the properties of the beam. These reorientation maneuvers can be implemented by using feedback control. Author

EFFICIENT REORIENTATION OF A DEFORMABLE BODY IN SPACE: A FREE-FREE BEAM EXAMPLE

Ilya V. Kolmanovsky and N. Harris McClamroch *In its* Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads 3 Jun. 1993 5 p Presented at the American Control Conference, 1993 (For primary document see N93-29988 11-18)
(Grant NSF MSS-91-14630)
Avail: CASI HC A01/MF A02

It is demonstrated that the planar reorientation of a free-free beam in zero gravity space can be accomplished by periodically changing the shape of the beam using internal actuators. A control scheme is proposed in which electromechanical actuators excite the flexible motion of the beam so that it rotates in the desired manner with respect to a fixed inertial reference. The results can be viewed as an extension of previous work to a distributed parameter case. Author

SPACE STATION ATTITUDE DISTURBANCE ARISING FROM INTERNAL MOTIONS

Patrick J. McNally and N. Harris McClamroch *In its* Efficient Reorientation Maneuvers for Spacecraft with Multiple Articulated Payloads 3 Jun. 1993 5 p Presented at the American Control Conference, 1993 (For primary document see N93-29988 11-18)
(Grant NSF MSS-91-14630)
Avail: CASI HC A01/MF A02

A source of space station attitude disturbances is identified. The attitude disturbance is driven by internal space station motions and is a direct result of conservation of angular momentum. Three examples are used to illustrate the effect: a planar three link system, a rigid carrier body with two moveable masses, and a nonplanar five link system. Simulation results are given to show the magnitude of the attitude change in each example. Factors which accentuate or attenuate this disturbance effect are discussed. Author

A simulation of Columbus payload operations performed with the aid of the Mission Activities and Resource Scheduler (MaRS) is presented. This exercise was performed to assess the capabilities of the Columbus APM (Attached Pressurized Module) in terms of resources such as crew availability, power supply and video downlink, and to identify any bottlenecks. The data describing the requirements of each of the 58 model experiments (including American and Canadian ones) of the fully outfitted APM was taken from the Columbus Payload Database (CPDB) and from the Columbus Payload Requirements Document. A description of the main features of the MARS system and the set up for this exercise is given. ESA

DYNAMICS AND ROBUST CONTROL OF SAMPLED DATA SYSTEMS FOR LARGE SPACE STRUCTURES Final Report, Sep. 1989 - 1991

Peter M. Bainum, Aprille J. Ericsson, and Xing Quang-Qian Nov. 1992 177 p
(Contract F33615-89-C-3225)
(AD-A264192; WL-TR-92-3088) Avail: CASI HC A09/MF A02

The objective of this research is to develop practical design procedures that can be used in conjunction with optimal digital controllers for future orbiting large space structural systems. In practice, the observational data used to verify the orientation and shape of large flexible systems will, in general, be collected on a sampled basis (discrete-time data system). The system is assumed to be completely observable and deterministic. Systems which will be designed to control both the overall orientation as well as the shape of some of the subsystems (such as antenna mesh form) must function in the discrete-time domain. The aim of this research is to develop methods that can be used to design linear quadratic regulator (LQR) controllers for orbiting large flexible systems. The digital control of an orbiting thin square plate system is analyzed in this volume of the final report. DTIC

THE MIDDECK 0-GRAVITY DYNAMICS EXPERIMENT Summary Report

Edward F. Crawley, Marthinus C. vanSchoor, and Edward B. Bokhour Washington 1993 107 p
(Contract NAS1-18690; RTOP 589-01-21-01)
(NASA-CR-4500; NAS 1.26:4500; SERC-16-92-R) Avail: CASI HC A06/MF A02

The Middeck 0-Gravity Dynamics Experiment (MODE), flown onboard the Shuttle STS-48 Mission, consists of three major elements: the Experiment Support Module, a dynamics test bed providing computer experiment control, analog signal conditioning, power conditioning, an operator interface consisting of a keypad and display, experiment electrical and thermal control, and archival data storage: the Fluid Test Article assembly, used to investigate the dynamics of fluid-structure interaction in 0-gravity; and the Structural Test Article for investigating the open-loop dynamics of structures in 0-gravity. Deployable, erectable, and rotary modules were assembled to form three one- and two-dimensional structures, in which variations in bracing wire and rotary joint preload could be introduced. Change in linear modal parameters as well as the change in nonlinear nature of the response is examined. Trends in modal parameters are presented as a function of force amplitude, joint preload, and ambient gravity. An experimental study of the lateral slosh behavior of contained fluids is also presented. A comparison of the measured earth and space results identifies and highlights the effects of gravity on the linear and nonlinear slosh behavior of these fluids. Author (revised)

DURABILITY OF QUICK REACTION SATELLITE ANTENNA (QRSA) TRUNNION CASTINGS Final Report

Wego Wang and Martin G. Wells Mar. 1993 26 p
(AD-A264095; ARL-TR-89) Avail: CASI HC A03/MF A01

Repeated failures of quick reaction satellite antenna (QRSA) trunnion castings in the field caused alarming concerns about their durability. Arguments over the cause of the failures, ranging from improper installation, unbalanced and/or excess force to poor design and insufficient material strength, have been disputed between the contractor and the government engineers. Incipient melting during solution treatment was also suspected as one of the reasons responsible for cracking in the original aluminum castings. This study compared the microstructures of as-cast and heat-treated samples and concluded that incipient melting did not occur during solution treatment and thus was not the principal cause for cracking in the aluminum castings. Eventually, the light aluminum alloy was replaced by a heavier but stronger ductile iron. As a result, the durability of the QRSA trunnion casting has been significantly improved and the deficiency was remedied. DTIC

The Microgravity Science and Applications Division's (MSAD) program to record and analyze the Shuttle's vibration environment is reviewed. This program provides microgravity science investigators with time and frequency analyses of the acceleration environment during their experiments' operation. Information is also provided for future investigators on the expected Shuttle vibration environment. As background, the two major elements of the program are discussed, the Space Acceleration Measurement System (SAMS) and the Acceleration Characterization and Analysis Project (ACAP). A comparison of the acceleration measurements from five Shuttle missions is discussed. Author (revised)

DESIGN OF A HIGH RESOLUTION SPATIAL HETERODYNE INTERFEROMETER M.S. Thesis
Kenneth M. Wallace, Jr. Dec. 1992 100 p
(AD-A262867) Avail: CASI HC A05/MF A02

Several new spatial heterodyne interferometers were evaluated using ray tracing analysis. A spherical grating interferometer was examined and found to have nonlinear fringe patterns that are difficult to interpret. A new plane grating interferometer was designed, built, and tested using a visible light laser as the source. The new design uses two mirrors and a single, planar diffraction grating to divide and recombine incident collimated light. The zero and first order ray paths recombine to produce a high contrast, linear, interference fringe pattern suitable for Fourier Transform analysis. The instrument has the potential to perform extremely high resolution spectroscopy in the FUV and EUV portions of the electromagnetic spectrum with resolving powers on the order of 10(exp 6). High resolution analysis of emission line profiles should enable an observer to more accurately determine atmospheric temperature and density profiles. The simple, lightweight, and compact instrument has no moving parts and is suitable for remote sensing from sounding rocket or satellite platforms. DTIC

This report presents a full description of the Space Generic Open Avionics Architecture (SGOAA). The SGOAA consists of a generic system architecture for the entities in spacecraft avionics, a generic processing architecture, and a six class model of interfaces in a hardware/software system. The purpose of the SGOAA is to provide an umbrella set of requirements for applying the generic architecture interface model to the design of specific avionics hardware/software systems. The SGOAA defines a generic set of system interface points to facilitate identification of critical interfaces and establishes the requirements for applying appropriate low level detailed implementation standards to those interface points. The generic core avionics system and processing architecture models provided herein are robustly tailorable to specific system applications and provide a platform upon which the interface model is to be applied. ANALYSIS OF TOPAZ 2 AND SPACE-R SPACE NUCLEAR POWER PLANTS USING A MODIFIED THERMIONIC MODEL M.S. Thesis
Otto D. Habedank Mar. 1993 107 p
(AD-A262612; AFIT/GNE/ENP/93M-03) Avail: CASI HC A06/MF A02

Models based on the TDS thermionic diode model were developed for TOPAZ 2 and SPACE-R nuclear power systems. Several parameter studies were conducted with the TOPAZ 2 model. These determined system performance and efficiency while varying the following: (1) Coolant flow inlet temperatures. (2) Rate of coolant temperature change. (3) Power profile of the core. (4) Cesium reservoir temperature. Analysis of results indicate the model accurately represented the TOPAZ 2 system, underestimating published data by 10%. Coolant flow studies indicate that raising coolant temperatures up to 100 K higher increases system power by up to 5%. Additional increases in temperature result in gradual performance degradation. Varying the axial power profile of the core from the actual peaked profile to a flat profile results in a negligible 0.3% change in system performance. The peaked profile used in TOPAZ 2 produces the highest system efficiency of all the profiles modeled. The cesium pressure study indicates the system is operating above optimum cesium pressure and system performance is strongly dependent on cesium pressure. Increasing cesium reservoir temperature above design temperature by 30 K decreases system efficiency by 30%. DTIC

CLUSTERED LANCE BOOSTER (CLB) FEASIBILITY STUDY Report, 29 Sep. 1992 - 28 Jan. 1993
27 Jan. 1993 132 p
(Contract DASG60-92-C-0120)
(AD-A262746) Avail: CASI HC A07/MF A02

Loral Vought (LV) was requested to investigate the feasibility of clustering four Lance propulsion systems as the first stage of a two-stage target vehicle. Two vehicle configurations were considered, both using the Clustered Lance Booster (CLB) as the first stage. On one configuration, the second stage will be the 40-inch diameter Liquid Fueled Target (LFT-40), which was the subject of an LTV Aerospace and Defense Company study in 1991. This configuration is designated as the CLB/LFT-40. The second stage of the other configuration will be a modified Lance having the same external shape as the Lance missile (22-inch diameter). This configuration is designated as the CLB/LFT-22. DTIC

SMALL HYDROGEN/OXYGEN ROCKET FLOWFIELD BEHAVIOR FROM HEAT FLUX MEASUREMENTS
Brian D. Reed Jun. 1993 30 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; sponsored by AIAA, SAE, ASME, and ASEE
(RTOP 506-42-31)

(NASA-TM-106233; E-7953; NAS 1.15:106233; AIAA Paper 93-2162)
Avail: CASI HC A03/MF A01

The mixing and heat transfer phenomena in small rocket flow fields with fuel film cooling is not well understood. An instrumented, water-cooled chamber with a gaseous hydrogen/gaseous oxygen injector was used to gather steady-state inner and outer wall temperature profiles. The chamber was tested at 414 kPa (60 psia) chamber pressure, from mixture ratios of 3.41 to 8.36. Sixty percent of the fuel was used for film cooling. These temperature profiles were used as boundary conditions in a finite element analysis program, MSC/NASTRAN, to calculate the local radial and axial heat fluxes in the chamber wall. The normal heat fluxes were then calculated and used as a diagnostic of the rocket's flow field behavior. The normal heat fluxes determined were on the order of 1.0 to 3.0 MW/meters squared (0.6 to 1.8 Btu/sec-inches squared). In the cases where mixture ratio was 5 or above, there was a sharp local heat flux maximum in the barrel section of the chamber. This local maximum seems to indicate a reduction or breakdown of the fuel film cooling layer, possibly due to increased mixing in the shear layer between the film and core flows. However, the flow was thought to be completely laminar, as the throat Reynolds numbers were below 50,000 for all the cases. The increased mixing in the shear layer in the higher mixture ratio cases appeared not to be due to the transition of the flow from laminar to turbulent, but rather due to increased reactions between the hydrogen film and oxidizer-rich core flows.

MEASUREMENTS OF MAGNETIC FIELDS PRODUCED BY A 30 kWe CLASS ARCJET POWER CONDITIONING UNIT Final Report, period ending Jun. 1992
Daron Bromaghim Jan. 1993 25 p
(DA Proj. 3058)
(AD-A262786; AD-E201429; PL-TR-92-3049) Avail: CASI HC A03/MF A01

The magnetic fields produced by a 30 kWe class Arcjet Power Conditioning Unit were measured using a Gauss meter and an axial magnetic field probe. These tests were conducted at Rocket Research Company in Redmond, WA from 11-12 Jun 1992, using a 30 kWe class Arcjet Power Conditioning Unit (PCU), and associated hardware. The PCU is an engineering model designed by Pacific Electrodynamics for the Electric Propulsion Experiment (ESEX) to be flown on the Advanced Research and Global Observation Satellite (ARGOS). Measurements were recorded at various locations around the PCU at ambient conditions and at power levels of 26, 20, 10, and 6.5 kWe. The results indicate the magnetic field presence is at a level, considering the 'worst case' scenario of test, well below any that would result in damaging effects to the spacecraft or to any other experiment.

SMALL STIRLING DYNAMIC ISOTOPE POWER SYSTEM FOR ROBOTIC SPACE MISSIONS
D. J. Bents Aug. 1992 18 p Presented at the Nuclear Technologies for Space Exploration, Jackson Hole, WY, 16-19 Aug. 1992; sponsored by American Nuclear Society
(RTOP 596-13-11)
(NASA-TM-105785; E-7215; NAS 1.15:105785) Avail: CASI HC A03/MF A01

The design of a multihundred-watt Dynamic Isotope Power System (DIPS), based on the U.S. Department of Energy (DOE) General Purpose Heat Source (GPHS) and small (multihundred-watt) free-piston Stirling engine (FPSE), is being pursued as a potential lower cost alternative to radioisotope thermoelectric generators (RTG's). The design is targeted at the power needs of future unmanned deep space and planetary surface exploration missions ranging from scientific probes to Space Exploration Initiative precursor missions. Power level for these missions is less than a kilowatt. The incentive for any dynamic system is that it can save fuel and reduce costs and radiological hazard. Unlike DIPS based on turbomachinery conversion (e.g. Brayton), this small Stirling DIPS can be advantageously scaled to multihundred-watt unit size while preserving size and mass competitiveness with RTG's. Stirling conversion extends the competitive range for dynamic systems down to a few hundred watts--a power level not previously considered for dynamic systems. The challenge for Stirling conversion will be to demonstrate reliability and life similar to RTG experience. Since the competitive potential of FPSE as an isotope converter was first identified, work has focused on feasibility of directly integrating GPHS with the Stirling heater head. Thermal modeling of various radiatively coupled heat source/heater head geometries has been performed using data furnished by the developers of FPSE and GPHS. The analysis indicates that, for the 1050 K heater head configurations considered, GPHS fuel clad temperatures remain within acceptable operating limits. Based on these results, preliminary characterizations of multihundred-watt units have been established.

PRELIMINARY ENDURANCE TESTS OF WATER VAPORIZERS FOR RESISTOJET APPLICATIONS
W. Earl Morren and Gregory S. MacRae Jun. 1993 27 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; cosponsored by AIAA, SAE, ASME, and ASEE
(RTOP 506-42-31)
(NASA-TM-106222; E-7871; NAS 1.15:106222; AIAA Paper 93-2403)
Avail: CASI HC A03/MF A01

Three water vaporizers designed for resistojet applications were built and tested for periods up to 500 h and 250 thermal cycles. Two of the vaporizers were not sensitive to orientation with respect to gravity, an indication of likely compatibility with low-gravity environments. Some temperatures and pressures in the third were impacted by orientation, although operation was always stable. The pressure drop across the sand-filled version increased by 147 percent in 38 h and 19 thermal cycles. Bonding of the sand granules in the downstream end of the heat exchanger was the suspected cause of failure of this vaporizer. Pressure drops across the two sintered stainless steel-filled versions were more gradual. One, with a pore size of 60 microns, showed an 80 percent increase in 500 h and 250 thermal cycles and another, with a 10 microns poresize, showed a 29 percent increase in 350 h and 175 thermal cycles. Testing of the latter metal-filled vaporizer was ongoing as of this writing. Oxidation of the porous metal packing materials in these vaporizers, with subsequent deposition of oxide particles within the pores, was believed to have caused the observed increases in pressure drops.

A design and analysis study was conducted to provide advanced engine descriptions and parametric data for space transfer vehicles. The study was based on an advanced oxygen/hydrogen engine in the 7,500 to 50,000 lbf thrust range. Emphasis was placed on defining requirements for high-performance engines capable of achieving reliable and versatile operation in a space environment. Four variations on the expander cycle were compared, and the advantages and disadvantages of each were assessed. Parametric weight, envelope, and performance data were generated over a range of 7,500 to 50,000 lb thrust and a wide range of chamber pressure and nozzle expansion ratio. Author

A rocket motor nozzle with an ablative internal structural member which provides rigidity to the rocket motor both prior to and during motor operation is described. The rocket motor nozzle of the present invention includes an outer shell which converges to a throat and then diverges to form an entrance. An ablative stiffening band, secured to the inner surface of the nozzle and extending from the aft portion of the nozzle to the throat, is contoured to allow the exhaust gases to flow smoothly through a central longitudinal opening in the band. RELIABILITY ASSESSMENT OF THRUST CHAMBER COOLING CONCEPTS USING PROBABILISTIC ANALYSIS TECHNIQUES

Douglas C. Rapp Jun. 1993 20 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; sponsored by AIAA, SAE, ASME, and ASEE
(Contract NAS3-25266; RTOP 584-04-11)
(NASA-CR-190785; E-7932; NAS 1.26:190785; AIAA Paper 93-2163)
Avail: CASI HC A03/MF A01

The reliability of OFHC (Oxygen Free High Conductivity) copper and NARloy-Z thrust chambers is assessed by applying probabilistic structural analysis techniques to incorporate design parameter variability and uncertainty. Thrust chambers specifically evaluated are the cylindrical test fixtures employed in a plug-nozzle configuration at the NASA Lewis Research Center. Direct sampling Monte Carlo simulations based on a simplified life prediction methodology established probability densities of firing cycles to structural failure. Simulated cyclic lives demonstrated modest agreement to experiment. Similarly, regions of high structural failure probability were determined using a limit state approach employing calculated cumulative distribution functions for effective stress response and an assumed material strength distribution. A probability of failure of 0.012 was calculated at the center of the coolant channel hot-gas-side wall for an OFHC milled channel. Structural response was found to be sensitive to the uncertainties in the thrust chamber thermal environment and the material's thermal expansion coefficient. Author

EVALUATION OF ACTUATOR ENERGY STORAGE AND POWER SOURCES FOR SPACECRAFT APPLICATIONS

William E. Simon and Fred M. Young 26 May 1993 74 p
(Grant NAG9-561)
(NASA-CR-193226; NAS 1.26:193226) Avail: CASI HC A04/MF A01

The objective of this evaluation is to determine an optimum energy storage/power source combination for electrical actuation systems for existing (Solid Rocket Booster (SRB), Shuttle) and future (Advanced Launch System (ALS), Shuttle Derivative) vehicles. Characteristic of these applications is the requirement for high power pulses (50-200 kW) for short times (milliseconds to seconds), coupled with longer-term base or 'housekeeping' requirements (5-16 kW). Specific study parameters (e.g., weight, volume, etc.) as stated in the proposal and specified in the Statement of Work (SOW) are included. Author (revised)

Avail: CASI HC A03/MF A01; 1 functional color page

Results are reported from preliminary tests to evaluate the high power microwave electrothermal thruster (MET) concept, which employs a free-floating plasma discharge maintained by applied CW microwave power to heat a propellant gas flow. Stable plasmas have been created and maintained in helium (He), nitrogen (N2), and hydrogen (H2) as propellants in both the TM(sub 011) and TM(sub 012) modes at discharge pressures from 10 Pa to 69 kPa. Reproducible starting conditions of pressure and power have been documented for all the plasmas. Vortical inflow of the propellant gas was observed to cause the formation of on-axis 'spike' plasmas. The formation and unformation conditions of these plasmas were studied. Operation in the spike plasma condition enables maximum power absorption with minimum wall heating and offers maximum efficiency in heating the propellant gas. In the spike condition, plasmas of the three propellant gases were investigated in an open channel configuration to a maximum applied power level of 11.2 kW (in N2). Microwave power coupling efficiencies of over 90 percent were routinely obtained at absorbed power levels up to 2 kW. Magnetic nozzle effects were investigated with a superconducting solenoid Al magnet applying a high magnetic field to the plasmas in and exiting from the discharge tube. Author (revised)

GRAVITY SENSITIVITY OF A RESISTOJET WATER VAPORIZER

W. Earl Morren Jun. 1993 24 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; cosponsored by AIAA, SAE, ASME, ASEE
(RTOP 506-42-31)
(NASA-TM-106220; E-7870; NAS 1.15:106220; AIAA Paper 93-2402)
Avail: CASI HC A03/MF A01

A laboratory model of a water vaporizer for resistojet applications was designed, fabricated, and steady and transient characteristics were measured. Vaporizer operation was not impacted by rotation about a horizontal axis normal to its own. The vaporizer was operated under low and high accelerations aboard a jet aircraft for periods up to 25 s at flow rates ranging from 159(10)(exp -6) to 230(10)(exp -6) kg/s. Slight changes in inlet and outlet pressures and some heat exchanger temperatures were observed during the low-gravity tests. However, the results of these tests indicated probable compatibility of the vaporizer design tested with a low-gravity environment. Author (revised)

ENGINEERING CONSIDERATION FOR THE SELF-ENERGIZING MAGNETOPLASMADYNAMIC (MPD): TYPE FUSION PLASMA THRUSTER Annual Report, Jul. 1991 - Jun. 1992

Chan K. Choi and Glen T. Nakafuji Feb. 1993 103 p
(Contract F04611-90-K-0054)
(AD-A262785; AD-E201447; PL-PU/92003; PL-TR-92-3043) Avail: CASI HC A06/MF A02

The major objective of the present study is to perform parametric studies of various DPF electrode configurations using an equivalent circuit model. The operation of the DPF device in the current-rise state is modeled using a transient code simulation of the equivalent circuit. Parametric studies of four DPF electrode configurations which include the tapered, cylindrical anode tip of the Livermore-I experiment, the anode tip with an equilateral triangular shape, the extended triangular anode tip, and the untapered cylindrical anode tip were all performed. Besides the various geometrical shapes, the electrode configurations also depend very sensitively on the dimension of the anode length. The parametric studies indicated that both the equilateral triangular tip and the cylindrical tip configurations generated high sheath currents and F/W values while maintaining relatively similar values of I(sub sp) for all electrode configurations. The extended triangular tip geometry, however, performed less favorably to F/W values and the sheath currents, though the differences compared to the values of other geometries were not very significant. It is thus noted that adequate operating currents can be reached by optimizing the electrode geometry and the charging circuit voltage and that the equivalent circuit modeling provides a realistic basis for analyzing plasma focus pinch dynamics. LIQUID FUEL INJECTION ELEMENTS FOR ROCKET ENGINES Patent Application
George B. Cox, Jr., inventor (to NASA) (Pratt and Whitney Aircraft, West Palm Beach, FL.) 27 Jan. 1993 17 p
(NASA-Case-MFS-28547-1; NAS 1.71:MFS-28547-1; US-Patent-Appl-SN-010037) Avail: CASI HC A03/MF A01

Thrust chambers for liquid propellant rocket engines include three principal components. One of these components is an injector which contains a plurality of injection elements to meter the flow of propellants at a predetermined rate, and fuel to oxidizer mixture ratio, to introduce the mixture into the combustion chamber, and to cause them to be atomized within the combustion chamber so that even combustion takes place. Evolving from these injectors are tube injectors. These tube injectors have injection elements for injecting the oxidizer into the combustion chamber. The oxidizer and fuel must be metered at predetermined rates and mixture ratios in order to mix them within the combustion chamber so that combustion takes place smoothly and completely. Hence tube injectors are subject to improvement. An injection element for a liquid propellant rocket engine of the bipropellant type is provided herein which includes tangential fuel metering orifices, and a plurality of oxidizer tube injection elements whose injection tubes are also provided with tangential oxidizer entry slots and internal reed valves. HYPERVELOCITY IMPACT TESTING OF THE SPACE STATION UTILITY DISTRIBUTION SYSTEM CARRIER
Scott Lazaroff Jul. 1993 61 p
(NASA-TM-104771; S-723; NAS 1.15:104771) Avail: CASI HC A04/MF A01

A two-phase, joint JSC and McDonnell Douglas Aerospace-Huntington Beach hypervelocity impact (HVI) test program was initiated to develop an improved understanding of how meteoroid and orbital debris (M/OD) impacts affect the Space Station Freedom (SSF) avionic and fluid lines routed in the Utility Distribution System (UDS) carrier. This report documents the first phase of the test program which covers nonpowered avionic line segment and pressurized fluid line segment HVI testing. From these tests, a better estimation of avionic line failures is approximately 15 failures per year and could very well drop to around 1 or 2 avionic line failures per year (depending upon the results of the second phase testing of the powered avionic line at White Sands). For the fluid lines, the initial McDonnell Douglas analysis calculated 1 to 2 line failures over a 30 year period. The data obtained from these tests indicate the number of predicted fluid line failures increased slightly to as many as 3 in the first 10 years and up to 15 for the entire 30 year life of SSF. The Long Duration Exposure Facility (LDEF) and the accompanying experiments were composed of and contained a wide variety of materials representing the largest collection of materials flown in low Earth orbit (LEO) and retrieved for ground based analysis to date. The results and implications of the mechanical, thermal, optical, and electrical data from these materials are the foundation on which future LEO space missions will be built. The LDEF Materials Special Investigation Group (MSIG) has been charged with establishing and developing data bases to document these materials and their performance to assure not only that the data are archived for future generations but also that the data are available to the spacecraft user community in an easily accessed, user-friendly form. This paper discusses the format and content of the three data bases developed or being developed to accomplish this task. The hardware and software requirements for each of these three data bases are discussed along with current availability of the data bases. This paper also serves as a user's guide to the MAPTIS LDEF Materials Data Base. Author

SYNTHESIS OF OLIGOIMIDES AND OLIGOIMIDE ANION RADICALS Final Technical Report
Larry L. Miller 1992 11 p
(Contract N00014-90-J-1569)
(AD-A263129) Avail: CASI HC A03/MF A01

Key to the results described in parts B-D are compounds based on naphthalene dianhydride (A) and dimethoxybenzidine (B). It was demonstrated that AB type oligoimides with lengths up to 80 A (8 nm) (BABABAB) could be synthesized as single molecular weight, pure and usually soluble compounds. Although rotation about the single bonds along the chain is possible, the chains cannot fold. These oligomers constitute the longest, single molecular weight rigid rods that are known. Various end groups could be attached and unsymmetrical rigid rods (different end groups) could be prepared. The compounds were characterized by NMR, IR, MS, and HPLC. In one case, a single crystal was obtained which confirmed the linear structure and that the B units were twisted with respect to the A units. Electrochemical studies showed that the naphthalene diimide group (A) formed anion radical (A-) and dianions (A=), which were stable in DMF in the absence of air. DTIC

NEAR NET SHAPE PROCESSING: A NECESSITY FOR ADVANCED MATERIALS APPLICATIONS
Howard A. Kuhn *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 1-3 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

High quality discrete parts are the backbones for successful operation of equipment used in transportation, communication, construction, manufacturing, and appliances. Traditional shapemaking for discrete parts is carried out predominantly by machining, or removing unwanted material to produce the desired shape. As the cost and complexity of modern materials escalates, coupled with the expense and environmental hazards associated with handling of scrap, it is increasingly important to develop near net shape processes for these materials. Such processes involve casting of liquid materials, consolidation of powder materials, or deformation processing of simple solid shapes into the desired shape. Frequently, several of these operations may be used in sequence to produce a finished part. The processes for near net shape forming may be applied to any type of material, including metals, polymers, ceramics, and their composites. The ability to produce shapes is the key to implementation of laboratory developments in materials science into real world applications. This seminar presents an overview of near net shapemaking processes, some application examples, current developments, and future research opportunities. Derived from text

MECHANICAL PROPERTIES OF COMPOSITE MATERIALS c24
H. Richard Thornton and L. R. Cornwell *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 43-48 (For primary document see N93-30948 11-23)
Avail: CASI HC A01/MF A04

A composite material incorporates high strength, high modulus fibers in a matrix (polymer, metal, or ceramic). The fibers may be oriented in a manner to give varying in-plane properties (longitudinal, transverse-stress, strain, and modulus of elasticity). The lay-up of the composite laminates is such that a center line of symmetry and no bending moment exist through the thickness. The laminates are tabbed, with either aluminum or fiberglass, and are ready for tensile testing. The determination of the tensile properties of resin matrix composites, reinforced by continuous fibers, is outlined in ASTM standard D 3039, Tensile Properties of Oriented Fiber Composites. The tabbed flat tensile coupons are placed into the grips of a tensile machine and load-deformation curves plotted. The load-deformation data

are translated into stress-strain curves for determination of mechanical properties (ultimate tensile strength and modulus of elasticity).

NEW MATERIALS: FOUNTAINHEAD FOR NEW TECHNOLOGIES AND NEW SCIENCE
Roy Rustum *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 49-98 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

The role of materials as the benchmark technologies which give epochs of human history their names continues into the present. The discovery of new materials has nearly always been the source of new materials science, and frequently of new technologies. This paper analyzes the actual processes by which new materials are synthesized, i.e. whether driven by serendipitous observations, new knowledge is pulled by the market, or integrated into a technological thrust. This analysis focuses on modern ceramic materials discoveries, since World War 2 and uses 45 years experience in materials synthesis in the author's own laboratory as case studies. A dozen different families of materials or processes are involved: hydrothermal reactions; sol-gel processing; clays and zeolites; electroceramics; zero expansion ceramics; diamond films; and radioactive waste host phases. Nanocomposite concepts introduced by the author a decade ago offer an entire, large, new class of materials which will dominate synthesis for the next period. The future of materials research for the next 25 years cannot be extrapolated from the past 25 years. We are near the asymptote for materials utilization in most metals. Likewise we are approaching saturation in improvement of many useful properties. Justifying much further 'basic' R/D for incremental improvement in civilian-oriented industries will not be easy. In materials synthesis, the near-term future is sure to emphasize not new phases, but tailored micro- and nanocomposites for chemical, electrical, optical, and magnetic uses. Unexpected new discoveries such as the Lanxide process may offer rarer chances for step function advances. The new structure of knowledge management will rely less on local research than on integration of worldwide inputs. Better scientific and technological opportunities will lie in designing knowledge intensive materials to meet the new environmental and conservation goals, and the human needs of the very large numbers at the bottom of the socio-economic structures of the world.

MICROPIPET MANIPULATION OF LIPID MEMBRANES: DIRECT MEASUREMENT OF THE MATERIAL PROPERTIES OF A COHESIVE STRUCTURE THAT IS ONLY TWO MOLECULES THICK **c27**
David Needham *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 99-120 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

The objectives are to demonstrate how we can make direct measurements of the mechanical properties of a special structure in biology, namely the lipid bilayer membrane, using a micromanipulation technique, and how these properties compare and contrast with 'more traditional' technological/engineering materials. Given that the investment in equipment and expertise to carry out these experiments is probably beyond the scope of most teaching labs, the described experiment is not intended as one that can actually be demonstrated in a student laboratory class. The intention behind presenting this work is to begin to raise awareness in the Material Science community about the material properties of biological material that form a new (to us) category of soft engineering materials that have dimensions on the nanoscale. Steven M. Tipton *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 137-146 (For primary document see N93-30948 11-23)
Avail: CASI HC A02/MF A04

The objective is to enable the student to generate statistically sound fatigue data sets on wire specimens of varying diameter, microstructure, or material. The student can then assess the effect of these parameters of fatigue resistance. The student can also be exposed to ASTM techniques for fatigue data reduction and presentation. Experiments involving variable amplitude block loading are also easily conducted. Derived from text

INTRODUCTION TO HIGH PERFORMANCE COMPOSITES **c24**
Norman J. Johnston *In its* National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 147-192 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

The following questions are addressed: What are high performance composites?; How are they used today?; What are their properties?; How do you make them?; and What are the future technology needs for composites? In addition, samples of composite reinforcements such as glass, carbon and Kevlar fibers, matrix materials, and fabricated composite parts will be demonstrated and made available. Author (revised)

Roy Bunnell (Battelle Pacific Northwest Labs., Richland, WA.), and Robert Berrettini (Materials Research Society, University Park, PA.) *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 193-196 (For primary document see N93-30948 11-23)
Avail: CASI HC A01/MF A04

Last year, at NEW: Update '91, a panel discussion was held to address the unique difficulties of attracting and retaining minorities and women in technical studies. Unfortunately, retention in technical majors is a problem of varying proportions for the entire student population, and must be improved in order to maintain the strength of the nation's industrial base. To investigate the cause of student attrition in technical majors, in-depth interviews of both current and former (non-graduating) engineering students at four colleges and universities in Colorado were conducted by Hewitt and Seymour. They found that there was no significant difference in the level of high school preparation and undergraduate academic performance in these two

groups, despite the prevailing faculty perception that most students who switch from technical to nontechnical majors were underprepared. The majority of engineering students who changed majors reported that they were turned off by science, while one-third complained of poor teaching.

IMPROVED MEASUREMENT OF THERMAL EFFECTS ON MICROSTRUCTURE **c76**
Mansur Rastani *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 197-207 (For primary document see N93-30948 11-23)
Avail: CASI HC A02/MF A04

The objectives were to introduce a simple methodology which could be used to replace the time-consuming and expensive conventional methods of metallographic and quantitative analysis of thermal treatment effect on microstructure. Metallurgical analysis continually calls for the evaluation of thermal treatment effects on microstructure. This commonly demands metallographic sample preparation and microscopic examination, which are time absorbing and costly. These drawbacks are burdensome when large numbers of samples must be levied fast. Mechanical testing can sometimes be substituted, but sample size and shape frequently make these methods impractical. The experiment described here is ideal for the microstructural evaluation of lamp filaments and other wire samples such as copper wire which can be conveniently coiled. Derived from text

DIRECT TENSION EXPERIMENTS ON COMPACTED GRANULAR MATERIALS **c39**
Steven W. Perkins *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 209-220 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

The objective of this experiment is to determine the level of tensile strength of uncemented, dry, granular materials. The experimental apparatus does not lend itself to a direct measurement of the material's tensile strength, but must be analyzed as a stress field problem in order to arrive at a tensile strength value. The experiment, and subsequent analysis, serve to instruct the student on the influence of gravitationally induced stresses in frictional granular materials, the importance and difficulty of accurately describing the entire failure envelope for granular materials in the low mean stress range, and the fundamental principles of material modeling.

LABORATORY EXPERIMENTS IN INTEGRATED CIRCUIT FABRICATION **c33**
Thomas J. Jenkins and Edward S. Kolesar *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 233-272 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

The objectives of the experiment are fourfold: to provide practical experience implementing the fundamental processes and technology associated with the science and art of integrated circuit (IC) fabrication; to afford the opportunity for the student to apply the theory associated with IC fabrication and semiconductor device operation; to motivate the student to exercise engineering decisions associated with fabricating integrated circuits; and to complement the theory of n-channel MOS and diffused devices that are presented in the classroom by actually fabricating and testing them. Therefore, a balance between theory and practice can be realized in the education of young engineers, whose education is often criticized as lacking sufficient design and practical content.

Avail: CASI HC A02/MF A04

The objectives are to demonstrate the change in mechanical properties of a thermoplastic polymer when the polymer is heated above the glass transition temperature. The instructor or student can perform this demonstration. In preparation for the demonstration, fill the flask or beaker 3/4 full with water and bring the water to a boil. First observe the initial stiffness of the toothbrush by slightly flexing it. Note that it is fairly stiff and retains its initial shape when the forces are removed. If you were to apply enough force, the toothbrush would break in a somewhat brittle fashion. Now place the toothbrush in the boiling water for 2 minutes. After the 2 minutes are up, remove the toothbrush from the boiling water with the washcloth. At this time, you will be able to bend the toothbrush easily. When it cools it will retain this bent shape. You've just demonstrated heating the polymer above the glass transition temperature, demonstrating thermoplastic softening. Instructor notes are provided. Derived from text

PHASE TRANSITION STUDIES IN BARIUM AND STRONTIUM TITANATES AT MICROWAVE FREQUENCIES **c76**
Jai N. Dahiya *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 359-370 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

The objectives were the following: to understand the phase transformations in barium and strontium titanates as the crystals go from one temperature to the other; and to study the dielectric behavior of barium and strontium titanate crystals at a microwave frequency of 9.12 GHz and as a function of temperature. Phase transition studies in barium and strontium titanate are conducted using a cylindrical microwave resonant cavity as a probe. The cavity technique is quite successful in establishing the phase changes in these crystals. It appears that dipole relaxation plays an important role in the behavior of the dielectric response of the medium loading the cavity as phase change takes place within the sample. The method of a loaded resonant microwave cavity as applied in this work has proven to be sensitive enough to monitor small phase changes of the cavity medium. Derived from text

PERFORMANCE OF THERMAL ADHESIVES IN FORCED CONVECTION **c27**
Nikhil K. Kundu *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 393-401 (For primary document see N93-30948 11-23)
Avail: CASI HC A02/MF A04

Cooling is critical for the life and performance of electronic equipment. In most cases cooling may be achieved by natural convection but forced convection may be necessary for high wattage applications. Use of conventional type heat sinks may not be feasible from the viewpoint of specific applications and the costs involved. In a heat sink, fins can be attached to the well by ultrasonic welding, by soldering, or with a number of industrially available thermal adhesives. In this paper, the author investigates the heat transfer characteristics of several adhesives and compares them with ultrasonic welding and theoretically calculated values. This experiment was conducted in an air flow chamber. Heat was generated by using heaters mounted on the well. Thermstrate foil, Uniset A401, and Aremco 571 adhesives were tested along with an ultrasonically welded sample. Ultrasonic welding performed far better than the adhesives and Thermstrate foil. This type of experiment can be adapted for a laboratory exercise in an upper level heat transfer course. It gives students an exposure to industrial applications that help them appreciate the importance of the course material. Author (revised)

TAGUCHI METHOD OF EXPERIMENTAL DESIGN IN MATERIALS EDUCATION **c80**
Martin W. Weiser *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 403-414 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

Some of the advantages and disadvantages of the Taguchi Method of experimental design as applied to Materials Science will be discussed. This is a fractional factorial method that employs the minimum number of experimental trials for the information obtained. The analysis is also very simple to use and teach, which is quite advantageous in the classroom. In addition, the Taguchi loss function can be easily incorporated to emphasize that improvements in reproducibility are often at least as important as optimization of the response. The disadvantages of the Taguchi Method include the fact that factor interactions are normally not accounted for, there are zero degrees of freedom if all of the possible factors are used, and randomization is normally not used to prevent environmental biasing. In spite of these disadvantages it is felt that the Taguchi Method is extremely useful for both teaching experimental design and as a research tool, as will be shown with a number of brief examples. POWDER METALLURGY: SOLID AND LIQUID PHASE SINTERING OF COPPER **c26**
Rex Sheldon and Martin W. Weiser *In* NASA. Langley Research Center, National Educators' Workshop. Update 92: Standard Experiments in Engineering Materials Science and Technology Jun. 1993 p 415-430 (For primary document see N93-30948 11-23)
Avail: CASI HC A03/MF A04

Basic powder metallurgy (P/M) principles and techniques are presented in this laboratory experiment. A copper based system is used since it is relatively easy to work with and is commercially important. In addition to standard solid state sintering, small quantities of low melting metals such as tin, zinc, lead, and aluminum can be added to demonstrate liquid phase sintering and alloy formation. The Taguchi Method of experimental design was used to study the effect of particle size, pressing force, sintering temperature, and sintering time. These parameters can be easily changed to incorporate liquid phase sintering effects and some guidelines for such substitutions are presented. The experiment is typically carried out over a period of three weeks. Author (revised)

SYNTHESIS OF CONDUCTING POLYMER COMPOSITE FIBERS IN ELECTROCHEMICAL FLOW CELLS Technical Report, 30 Jun. 1992 - 31 Mar. 1993
Shulong Li and Henry S. White 20 Mar. 1993 20 p
(Contract N00014-91-J-1927)
(AD-A262233; TR-21) Avail: CASI HC A03/MF A01

A one-step electrochemical synthesis of polymer and composite polymer fibers of macroscopic dimensions (greater than 10 cm length and 0.2 mm diameter) is reported. Poly(3-methylthiophene) and polypyrrole fibers are grown from the tip of a Pt microelectrode by oxidation of 3-methylthiophene and pyrrole, respectively, in a capillary flow cell. Hydrodynamic fields within the capillary cell result in unidirectional growth of the polymer along the axis of the flow cell. High strength, conductive, and flexible composite polymer fibers are synthesized by deposition of poly(3-methylthiophene) or polypyrrole on a non conductive Kevlar or polyester string suspended in the solution along the axis of the capillary flow cell. Composite fiber growth rates as large as 30 cm/hr are obtained under optimal conditions. DTIC

INFLUENCE OF PLY WAVINESS ON STIFFNESS AND STRENGTH REDUCTION OF COMPOSITE LAMINATES Final Report, Jun. 1991 - Aug. 1992
Travis A. Bogetti, Jack W. Gillespie, Jr., and Mark A. Lamontia Apr. 1993 49 p
(DA Proj. 1L1-62618-AH-80)
(AD-A263224; ARL-TR-110) Avail: CASI HC A03/MF A01

An analytic model is developed to investigate the influence of ply waviness on the stiffness and strength of composite laminates. The model predicts the following: elastic properties and thermal expansion coefficients of sublaminates containing wavy layers; ply stress for prescribed mechanical and thermal load cases; and strength reduction associated with ply waviness. Parametric studies are conducted for sublaminates of AS4 Graphite/PEKK and S2 Glass/PEKK which exhibit layer waviness. Results show that stiffness and strength reduction are significant in the direction of ply undulation only. Mechanisms of stiffness reduction are attributed to out-of-plane rotation of wavy layers. This waviness may also create significant interlaminar shear stress that reduces strength. The magnitude of the property reduction increases as the amplitude of the undulation increases and the half-wavelength of the undulation decreases. Ply waviness represents one mechanism that may partially explain why the design and failure analyses of composite structures based on flat, autoclave cured coupon property data (minimal waviness), do not correlate well with test results. DTIC

ULTRAHIGH TEMPERATURE ASSESSMENT STUDY: CERAMIC MATRIX COMPOSITES Final Report, Jul. 1988 - May 1990
E. L. Courtright, H. C. Graham, A. P. Katz, and R. J. Kerans Sep. 1992 143 p
(Contract MIPR-FY1457-88-N-5052; AF Proj. 2420)
(AD-A262740; WL-TR-91-4061) Avail: CASI HC A07/MF A02

As part of the U.S. Air Force initiative to develop high temperature materials for use in future gas turbine engines, a literature survey coupled with an assessment of recently completed experimental programs sponsored by the Air Force was made to evaluate prospective materials capable of operating at 1650 deg C or above in oxidizing environments. The assessment reviews fundamental considerations associated with the use of ceramics and ceramic matrix composites in representative environments and includes discussions on potential performance requirements. Key material categories (e.g., borides, carbides, nitrides, silicides, beryllides, and oxides) are evaluated with respect to their strengths and weaknesses. The reinforcements available for high temperature composite applications are reviewed and several prospective composite systems considered. A principal conclusion relative to possible uses for long-term man-rated gas turbine engines is that oxide/oxide composites-have the best potential for functional use in oxidizing environments above 1650 deg C provided adequate single-crystal reinforcement fibers can be developed. Several nonoxide materials and composites were identified for possible uses in short-duty cycle non-man-rated applications. In addition to materials development, there will be critical need for high-temperature test facilities that can be operated in representative oxidizing environments. DTIC

SOFT COMPUTING IN DESIGN AND MANUFACTURING OF ADVANCED MATERIALS
George Y Baaklini, Alex Vary, and Krzysztof J. Cios (Toledo Univ., OH.) Apr. 1993 8 p Presented at the ASME Conference, Cincinnati, OH, 24-27 May 1993: sponsored by IGTI and ASME
(RTOP 510-01-50)
(NASA-TM-106032; E-7597; NAS 1.15:106032) Avail: CASI HC A02/MF A01

The potential of fuzzy sets and neural networks, often referred to as soft computing, for aiding in all aspects of manufacturing of advanced materials like ceramics is addressed. In design and manufacturing of advanced materials, it is desirable to find which of the many processing variables contribute most to the desired properties of the material. There is also interest in real time quality control of parameters that govern material properties during processing stages. The concepts of fuzzy sets and neural networks are briefly introduced and it is shown how they can be used in the design and manufacturing processes. These two computational methods are alternatives to other methods such as the Taguchi method. The two methods are demonstrated by using data collected at NASA Lewis Research Center. Future research directions are also discussed. Author (revised)

A THERMAL STRESS SOLUTION FOR MULTILAYERED COMPOSITE CYLINDERS Final Report
Mark D. Witherell Feb. 1993 15 p
(AD-A262579; ARCCB-TR-93005) Avail: CASI HC A03/MF A01

An elastic thermal stress solution is presented for a multilayered composite cylinder subjected to a radial temperature field. The solution assumes each layer to be at a uniform temperature, therefore, many layers are required to model regions with large gradients in temperature. Previously developed closed-form solutions for a monolayered cylinder subjected to a uniform temperature change and loadings of internal and external pressures are used to construct the multilayered solution. Results produced by the theoretical solution were compared to those generated from a finite element analysis with excellent agreement. Finally, by combining a previously developed multilayered stress solution for loadings of internal pressure, external pressure, and axial force with the plane-strain thermal stress solution, the multilayered thermal stress solution for generalized plane-strain boundary conditions is shown to be easily obtained. DTIC

LIGHTWEIGHT FLEXIBLE COMPOSITE TENT MATERIALS Final Report, 4 Jun. 1991 - 31 Dec. 1992
Robert N. King 23 Oct. 1992 30 p
(Contract DAAK60-91-C-0028)
(AD-A263021) Avail: CASI HC A03/MF A01

The program investigated the theory that flexible composite materials can be engineered to provide the physical properties desirable for tent materials, particularly at reduced weights relative to currently available materials. The technology for combining materials into high performance composites is uncommon in the textile industry as a whole, but is commonly practiced by manufacturers specializing in high strength-to-weight ratio materials for applications such as sailcloth and aerospace insulation systems. High strength lightweight composite materials were developed which provide tailored physical properties for use as tent materials. These systems can be produced with commercially-available, reasonably low cost base materials which can be fabricated using existing manufacturing processes. A variety of materials and constructions were shown to meet a majority of the property requirements for the Five-Soldier Crew Tent. Future development of these lightweight constructions should focus on identifying flexible coating systems to improve the hand and durability properties of these continuous film composites. DTIC

The User's Manual for the Metal Matrix Laminate Tailoring (MMLT) program is presented. The code is capable of tailoring the fabrication process, constituent characteristics, and laminate parameters (individually or concurrently) for a wide variety of metal matrix composite (MMC) materials, to improve the performance and identify trends or behavior of MMC's under different thermo-mechanical loading conditions. This document is meant to serve as a guide in the use of the MMLT code. Detailed explanations of the composite mechanics and tailoring analysis are beyond the scope of this document, and may be found in the references. MMLT was developed by the Structural Mechanics Branch at NASA Lewis Research Center (LeRC). Author (revised)

ANALYSIS FOR THERMO-CHEMICAL DECOMPOSITION OF COMPOSITE STRUCTURES Interim Report, Jun. 1992-1993
Ramnath Ganesan, Sunpyo Lee, and N. J. Salamon May 1993 137 p
(Grant NAG8-879)
(NASA-CR-193185; NAS 1.26:193185) Avail: CASI HC A07/MF A02

Research progress for the second year's effort on analysis for thermochemical decomposition of composite structures is presented. The objectives were (1) to develop a fast, yet accurate time integration scheme, and (2) to code the theoretical formulation for a three-dimensional axisymmetric model and verify it against experimental data and results from the one-dimensional axisymmetric model. The objectives were met and surpassed in the case of multidimensional applications. The result is two fully-coupled (through displacement, temperature and pore pressure) and functioning computer codes. Author (revised)

THE EFFECT OF TEMPERATURE ON THE IMPACT BEHAVIOR OF TiB2 REINFORCED XDTM-TiAl INTERMETALLIC MATRIX COMPOSITES
M. K. Hamm and D. F. Hasson Nov. 1992 21 p
(AD-A262924; USNA-EW-23-92) Avail: CASI HC A03/MF A01

A study was performed to determine the effect of temperature on the impact behavior of two XD(TM) processed TiB2 reinforced TiAl intermetallic composites (IMC's). An existing instrumented tup drop tower apparatus was modified for the program. The IMC compositions were Ti-49 at. % Al + 5 vol. % TiB2 and Ti-48 at. % Al + 10 vol. % TiB2. The specimens were notched to an a/w ratio of 0.2. Details and test procedures for the modified apparatus were presented. Test temperatures ranged from -192 to 1100 C. Impact toughness and maximum bending stress for both IMC's decreased from room temperature to temperatures as high as 1100 C. An important experimental observation which supports these results is the change from transgranular cleavage to intergranular fracture at the 760 C test temperature. Also noted is the possible contribution to decreasing toughness of unfavorable difference in coefficient of thermal expansion between TiB2 and the matrix with increasing temperature. Data repeatability and verification of the ability to observe high temperature brittle-to-ductile transition behavior established confidence in the modification of the existing instrumented tup apparatus. ALIGNED, SHORT-FIBER COMPOSITES BY NOVEL FLOW PROCESSING METHODS
D. C. Guell, A. L. Graham, T. Papathanasiou, and J. J. Petrovic 1993 10 p Presented at the Advances in Polymer Processing, Cincinnati, OH, 29-31 Mar. 1993
(Contract W-7405-eng-36)
(DE93-008701; LA-UR-93-569; CONF-9303110-1) Avail: CASI HC A02/MF A01

A hydrodynamic method has been employed to align short, reinforcing fibers in polymer matrix composite materials. Samples of composite materials were prepared and tested two at a time (one with randomly oriented fibers and the other with aligned fibers) to isolate and directly measure the effect on mechanical properties of aligning the fibers. Data were collected for the ultimate tensile strength, modulus of elasticity, and ultimate tensile strain of the composite samples prepared. Results show that the aligned fibers were approximately twice as effective (as randomly oriented fibers) at stiffening and strengthening the composite in the alignment direction. DOE

DESIGN OF INTERFACES IN METAL MATRIX COMPOSITES Final Report, 1 Dec. 1989 - 30 Nov. 1992
Harris L. Marcus and Zwy Eliezer 15 Feb. 1993 47 p
(Contract N00014-90-J-1164)
(AD-A262052) Avail: CASI HC A03/MF A01

The main goal of this research was to optimize the interface properties in metal matrix composites by lattice matching the matrix and the dispersoids. Stable, coherent dispersoids can be achieved by mechanically alloying lattice-matched dispersoids into metal matrices and allowing some recrystallization or coarsening to occur, or by internal nitridization or carburization of homogeneous alloys. A model system that has a high probability of forming coherent interfaces is ZrN in Nb. For comparison purposed the relatively poorly matched systems TiN in Nb and TiN in Cu were also studies. The matrix/dispersoid orientation relationship in the Nb/ZrN system has been found to be (011)Nb,Zr (parallel) (001)ZrN. In the Nb/TiN system, the presence of an orientation relationship after extensive nitriding could not be detected. In the Cu/TiN system only external nitridation occurred when bulk Cu-Ti alloys were employed. However uniformly distributed nanosized TiN dispersoids were obtained when alloyed Cu-Ti powders were nitrided and subsequently mechanically alloyed. DTIC

COMPOSITE LAMINATE STIFFNESSES AND THEIR SENSITIVITIES
Bodo Geier Jun. 1992 40 p
(DLR-FB-92-16; ETN-93-93734) Avail: CASI HC A03/MF A01; DLR, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

An analysis of composite laminate stiffnesses and their sensitivities is presented within the framework of the design of structures made of composite materials. One of the columns upon which optimization of structures is built is the mathematical search method for locating a minimum (or maximum) of a constrained object function. Efficient algorithms will require the evaluation of derivatives of the object function as well as of the constraints. In that context the sensitivities of laminate stiffness matrices may be required. In order to meet such a requirement the derivatives with respect to both ply thicknesses and ply angles, of laminate stiffnesses including transverse shear stiffness, are presented. ESA

METHOD FOR PREPARATION OF A MICROPOROUS STRUCTURE WITH LAYERED INTERSTITIAL SURFACE TREATMENT Patent
Steven L. Koontz, inventor (to NASA) 1 Jun. 1993 10 p Filed 2 Jun.

1992 Continuation-in-part of US-Patent-Appl-SN-429739, filed 31 Oct. 1989
(NASA-Case-MSC-21487-2; US-Patent-5,215,790; US-Patent-Appl-SN-894505; US-Patent-Appl-SN-429739; US-Patent-Class-427-535; US-Patent-Class-427-244; US-Patent-Class-427-269; US-Patent-Class-427-270; US-Patent-Class-427-287; US-Patent-Class-427-377) Avail: US Patent and Trademark Office

A microporous structure with layered interstitial surface treatments, and method and apparatus for preparation thereof are described. The structure is prepared by sequentially subjecting a uniformly surface-treated structure to atomic oxygen treatment to remove an outer layer of surface treatment to a generally uniform depth, and then surface treating the so exposed layer with another surface treating agent. The atomic oxygen/surface treatment steps may optionally be repeated, each successive time to a lesser depth, to produce a microporous structure having multilayered surface treatments. The apparatus employs at least one side arm from a main atomic oxygen-containing chamber. The side arm has characteristic relaxation times such that a uniform atomic oxygen dose rate is delivered to a specimen positioned transversely in the side arm spaced from the main gas chamber. CERAMIC MATRIX COMPOSITES PROPERTIES/MICROSTRESSES WITH COMPLETE AND PARTIAL INTERPHASE BOND
Subodh K. Mital (Toledo Univ., OH.), Pappu L. N. Murthy, and Christos C. Chamis May 1993 13 p Presented at the 38th International SAMPE Symposium/Exhibition, Anaheim, CA, 10-13 May 1993
(RTOP 510-01-50)
(NASA-TM-106136; E-7816; NAS 1.15:106136) Avail: CASI HC A03/MF A01

A multilevel substructuring technique which includes a unique fiber substructuring concept is used for the analysis of continuous fiber reinforced ceramic matrix composites. This technique has four levels of substructuring--from laminate to ply, to supply, and then to fiber. A stand-alone computer code CEMCAN (Ceramic Matrix Composites Analyzer), incorporating this technique and specifically for the simulation of ceramic matrix composites behavior, is currently under development at NASA Lewis Research Center in Cleveland, Ohio. The thermal and mechanical properties, along with the microstresses, for a SiC/RBSN (silicon carbide fiber and reaction bonded silicon nitride matrix) composite at different fiber volume ratios and varying degrees of interfacial bond around the fiber circumference are computed. Values predicted by CEMCAN computer code are shown to bound the experimentally measured values. Results also show that transverse tensile strength test can be a sensitive test method to assess interfacial conditions. Author (revised)

THERMOVISCOPLASTIC ANALYSIS OF FIBROUS PERIODIC COMPOSITES USING TRIANGULAR SUBVOLUMES
Kevin P. Walker (Engineering Science Software, Inc., Smithfield, RI.), Alan D. Freed, and Eric H. Jordan (Connecticut Univ., Storrs.) Mar. 1993 28 p
(RTOP 505-63-5A)
(NASA-TM-106076; E-7686; NAS 1.15:106076) Avail: CASI HC A03/MF A01

The nonlinear viscoplastic behavior of fibrous periodic composites is analyzed by discretizing the unit cell into triangular subvolumes. A set of these subvolumes can be configured by the analyst to construct a representation for the unit cell of a periodic composite. In each step of the loading history, the total strain increment at any point is governed by an integral equation which applies to the entire composite. A Fourier series approximation allows the incremental stresses and strains to be determined within a unit cell of the periodic lattice. The nonlinearity arising from the viscoplastic behavior of the constituent materials comprising the composite is treated as fictitious body force in the governing integral equation. Specific numerical examples showing the stress distributions in the unit cell of a fibrous tungsten/copper metal matrix composite under viscoplastic loading conditions are given. The stress distribution resulting in the unit cell when the composite material is subjected to an overall transverse stress loading history perpendicular to the fibers is found to be highly heterogeneous, and typical homogenization techniques based on treating the stress and strain distributions within the constituent phases as homogeneous result in large errors under inelastic loading conditions. AXIAL IMPACT OF COMPOSITES Ph.D. Thesis
Levent Karaoglan 1993 110 p
Avail: Univ. Microfilms Order No. DA9309612

A finite element method was developed to calculate the behavior of an axisymmetric composite body of revolution impacting on an isotropic surface. The composite is made of unidirectional fiber reinforced plies, with no restriction either on the number of plies or on the orientation of the fibers in each ply; hence the laminate may be 'thin' or 'thick', and may be of 'symmetric' or 'unsymmetric' layups. The target may be a semi-infinite body or may be a simple supported or clamped slab. The impact velocity may be zero (static loading) or non-zero with the impactor penetrating the target. A user-friendly computer code AXIMPACT was written which provides the following information: (1) the position of the impactor during impact (including the penetration depth); (2) the stresses and strains in the impactor and the target; (3) the deformations of the impactor and the target; and (4) the failure of the composite impactor and the target. The code was validated by comparing results generated by the code to available analytical and numerical results and to data. In every case the agreement between the present and previous results was excellent. Dissert. Abstr.

ENVIRONMENTAL EFFECTS ON STITCHED RTM COMPOSITES Interim Report No. 93, Jan. 1991 - May 1993
Keith W. Furrow, Alfred C. Loos, H. Benson Dexter (National Aeronautics and Space Administration. Langley Research Center, Hampton, VA.), and Roberto J. Cano (National Aeronautics and Space Administration. Langley Research Center, Hampton, VA.) Jun. 1993 140 p
(Grant NAG1-343)
(NASA-CR-193221; NAS 1.26:193221; CCMS-93-07; VPI-E-93-06) Avail: CASI HC A07/MF A02

The effects of temperature and humidity cycling on the mechanical properties of AS4/3501-6 quasi-isotropic textile composites were determined. The composites were resin transfer molded from unstitched, Kevlar 29 stitched, and S-2 glass stitched uniweave fabric preforms. Temperature cycling ranged from 60 to -55 C while the relative humidity simultaneously varied between 95 and 0 percent. Data presented include photomicrographs, compression strengths, and compression-compression fatigue results for environmentally cycled and uncycled composites. Photos of microcracks found predominantly around individual stitches were taken at the end of each cycling period. The glass stitched and Kevlar stitched laminates developed significant microcracks before cycling but the microcracks did not grow after cycling. The unstitched uniweave material developed microcracks only after cycling. The glass stitched material had lower baseline compression strength than the unstitched and Kevlar stitched materials. Temperature and humidity cycling reduced the static compression strength of the unstitched and Kevlar stitched uniweave materials nearly 10 percent. Under the same conditions the glass stitched uniweave material lost 3 percent of its baseline strength. Combined temperature and humidity cycling did not affect the fatigue properties of the uniweave materials when the test specimens were dried to their original weights before testing. A second environmental cycle, varying only the temperature at constant 40 percent humidity, resulted in a 5 percent decrease in static compression strength for the unstitched and Kevlar stitched material. Unstitched, glass stitched, and Kevlar stitched materials exposed to constant 60 C and 95 percent relative humidity for 80 days and then saturated in 70 C water, lost 17, 7, and 19 percent of their baseline compression strength, respectively. Moisture absorption at constant temperature and humidity lowered the fatigue strength of the uniweave materials only after saturation. In hot humid conditions moisture diffuses into the composite. The mass diffusivities and maximum moisture uptake for the three uniweave composites were measured. Fick's law was used to predict the moisture absorption. Braided composites, including a stitched 2-D braid, an unstitched 2-D braid, and a 3-D braid, were also exposed to environmental cycling. The moisture absorption in these AS4/E905L systems was lower than the AS4/3501-6 systems and consequently the cycling had little effect on the strengths of braided materials. Author (revised)

TAILORED INTERFACES FOR METAL-MATRIX COMPOSITES-FUNDAMENTAL CONSIDERATIONS Final Technical Report, 1 Oct. 1988 - 30 Nov. 1992
Morris E. Fine and Julia R. Weertman 28 Jan. 1993 99 p
(Grant AF-AFOSR-0043-89)
(AD-A263048; AFOSR-93-0190TR) Avail: CASI HC A05/MF A02

The objective of this research was to investigate the interface properties needed for successful metal matrix composites. Thermodynamic stability of the interface and the phases in the composite, the nature of the bonding across the interface, and the energy and structure of the interface were studied. With TiC dispersed in Al prepared by the XD process, atomic resolution electron microscopy showed a sharp interface with large areas of partial coherence. The Al-TiC composite is remarkably ductile even at 15 vol.% TiC loading. This attributed to the ability of the Al to recrystallize at the interface forming semicoherent boundaries and to a high level of metallic binding between Al and Ti in TiC. DTIC

OXIDATION BEHAVIOR IN REACTION-BONDED ALUMINUM-SILICON ALLOY/ALUMINA POWDER COMPACTS Ph.D. Thesis
S. H. Yokota Dec. 1992 44 p
(Contract DE-AC03-76SF-00098)
(DE93-010407; LBL-33405) Avail: CASI HC A03/MF A01

The goal of this research is to determine the feasibility of producing low-shrinkage mullite/alumina composites by applying the reaction-bonded alumina (RBAO) process to an aluminum-silicon alloy/alumina system. Microstructural and compositional changes during heat treatment were studied by removing samples from the furnace at different steps in the heating schedule and then using optical and scanning electron microscopy, EDS and XRD to characterize the powder compacts. Results suggest that the oxidation behavior of the alloy compact is different from the model proposed for the pure Al/alumina system. DOE

LOW TEMPERATURE (LT) GaAs AND RELATED MATERIALS Final Report, 15 Sep. 1991 - 14 Sep. 1992
Gerald L. Witt, Robert Calawa, Umesh Mishra, and Eicke Weber 14 Sep. 1992 311 p Symposium held in Boston, MA, 4-6 Dec. 1991
(Grant AF-AFOSR-0399-91)
(AD-A263607; AFOSR-93-0181TR) Avail: CASI HC A14/MF A03

The response to this symposium, less than two years later, accurately reflects the increasing awareness of the rich combination of fundamental materials science and electronic optoelectronic applications that are at play in the subject. The gradual and incomplete understanding of the basic mechanisms responsible for the remarkable properties of these materials have produced a confusion of names. At the time of planning for this symposium the organizers attempted to select a suitable name, one reflecting the understanding to date. However, events would have it otherwise. The then common phrase low temperature of LT GaAs was adopted reluctantly. In doing so, it was realized that this phrase is misleading and inaccurate. More appropriate are two other phrases used in these proceedings. GaAs with arsenic precipitates or GaAsAs and low temperature grown or LTG GaAs. This issue of terminology remains to be resolved. AN INVESTIGATION OF GRAPHITE PEEK COMPOSITE UNDER COMPRESSION WITH A CENTRALLY LOCATED CIRCULAR DISCONTINUITY M.S. Thesis
Benjamin Wham, II Mar. 1993 251 p
(AD-A262549; AFIT/GA/93M-01) Avail: CASI HC A12/MF A03

The purpose of this thesis was to determine (both experimentally and analytically) the initiation and progression of failure, stress-strain response, and the failure loads of Graphite/Polyetheretherketone (Gr/PEEK) laminates, incorporating a centrally located circular discontinuity, loading in axial compression at room temperature. The laminates studied were ((0 deg)(sub 16)), ((90 deg)(sub 16)), ((0 deg/90 deg)(SUB 4S)), ((+/- 45 deg)(sub 4S)), and ((0 deg/+/-45 deg/90 deg)(sub 2S)). The specimens were loaded within a Boeing Open Hole Compression Fixture. The micromechanical failure modes were identified using a Scanning Electron Microscope. The analytical progression of failure was predicted using a nonlinear finite element code. The code utilizes a total energy method predicated upon the material properties curves obtained from experimentation to compute the stress-strain response of the material as well as the progression of failure within the model. Results were compared and conclusions were drawn. DTIC

EFFECTS OF FREEZE/THAW CYCLES ON HYDROSTATICALLY CONDITIONED E-GLASS/J-2 COMPOSITE Final Report, Oct. 1991 - Sep. 1992
D. F. Hasson and M. K. Hamm Sep. 1992 17 p
(AD-A262980) Avail: CASI HC A03/MF A01

A study was performed to determine if freeze/thaw cycles of a polymer matrix composite (PMC) with high moisture content caused increased mechanical property degradation. The PMC was a 36 ply glass fiber with a thermoplast matrix. Moisture was added hydrostatically at high pressure. It was observed that freeze/thaw cycles did not appreciably decrease the maximum load. However, from short beam shear (SBS) specimens taken from the top, middle, and bottom of the hydrostatically conditioned sample, the load characteristics depended on specimen location. The middle SBS specimen had a maximum load very close to that for off the shelf dry samples. From optical microscopy it was observed that the freeze/thaw specimens failed with multiple delaminations while the dry samples failed with single delaminations. Further investigation of this observation is suggested. DTIC

IMPROVED SILICON NITRIDE FOR ADVANCED HEAT ENGINES Final Report
Harry C. Yeh and Ho T. Fang Apr. 1991 291 p
(Contract NAS3-24385; RTOP 533-05-01)
(NASA-CR-182193; Rept-88-61608; NAS 1.26:182193) Avail: CASI HC A13/MF A03

The results of a four year program to improve the strength and reliability of injection-molded silicon nitride are summarized. Statistically designed processing experiments were performed to identify and optimize critical processing parameters and compositions. Process improvements were monitored by strength testing at room and elevated temperatures, and microstructural characterization by optical, scanning electron microscopes, and scanning transmission electron microscope. Processing modifications resulted in a 20 percent strength and 72 percent Weibull slope improvement of the baseline material. Additional sintering aids screening and optimization experiments succeeded in developing a new composition (GN-10) capable of 581.2 MPa at 1399 C. A SiC whisker toughened composite using this material as a matrix achieved a room temperature toughness of 6.9 MPa m(exp .5) by the Chevron notched bar technique. Exploratory experiments were conducted on injection molding of turbocharger rotors. Author

APPARATUS FOR INTERCALATING LARGE QUANTITIES OF FIBROUS STRUCTURES Patent
James R. Gaier, inventor (to NASA) 6 Jul. 1993 7 p Filed 24 Jul. 1991 Supersedes N91-28289 (29 - 20, p 3304) Division of US-Patent-Appl-SN-608493, filed 2 Nov. 1990
(NASA-Case-LEW-15077-2; US-Patent-5,225,171; US-Patent-Appl-SN-735548; US-Patent-Appl-SN-608493; US-Patent-Class-422-209; US-Patent-Class-422-136; Int-Patent-Class-B01J-19/28) Avail: US Patent and Trademark Office

Apparatus for intercalating large quantities of fibrous structures uses a rotatable reaction chamber containing a liquid phase intercalate. The intercalate liquid phase is controlled by appropriately heating, cooling or pressurizing the reaction. Rotation of the chamber containing the fiber sample ensures total submergence if the fiber during intercalation.

Intercalated graphite fibers having metal-like resistivities are produced and are conceivably useful as electrical conductors.

(NASA-Case-LEW-14162-3; US-Patent-5,224,030; US-Patent-Appl-SN-880851; US-Patent-Appl-SN-657238; US-Patent-Appl-SN-501893; US-Patent-Class-361-386; US-Patent-Class-165-185; US-Patent-Class-174-16.3; US-Patent-Class-428-614; Int-Patent-Class-H05K-7/20) Avail: US Patent and Trademark Office

Gas derived graphite fibers generated by the decomposition of an organic gas are joined with a suitable binder. This produces a high thermal conductivity composite material which passively conducts heat from a source, such as a semiconductor, to a heat sink. The fibers may be intercalated. The intercalate can be halogen or halide salt, alkaline metal, or any other species which contributes to the electrical conductivity improvement of the graphite fiber. The fibers are bundled and joined with a suitable binder to form a high thermal conductivity composite material device. The heat transfer device may also be made of intercalated highly oriented pyrolytic graphite and machined, rather than made of fibers.

INTERFACIAL STUDIES OF REFRACTORY GLASS-CERAMIC MATRIX/ADVANCED SiC FIBER REINFORCED COMPOSITES Final Report, 1 Feb. 1990 - 1993

J. J. Brennan 1 Apr. 1993 65 p

(Contract N00014-87-C-0699)

(AD-A263264; R93-918246-6) Avail: CASI HC A04/MF A01

The main objective of this program was to characterize the chemistry and structure of new advanced small diameter silicon based fibers and determine how these factors influence the nature of the fiber/matrix interface in refractory glass-ceramic matrix composites. It is the nature of this interface that then determines to a great degree the composite thermal, environmental, and mechanical properties. The fibers under investigation during the course of this program included the lower oxygen Lox M Tyranno SiC fibers from Ube Industries, polymer derived crystalline SiC fibers from Dow Corning Corp., the Si-N-C-O 'Black' fibers from Textron Specialty Materials, low oxygen SiC fibers from the Univ. of Fla., as well as the new low oxygen radiation cured Nicalon SiC type fibers from Nippon Carbon Co. Since the availability of all of these fibers was extremely limited, emphasis was placed on the mechanical, chemical, and microstructural characterization of the fibers through tensile testing, SEM of fiber fracture characteristics, scanning Auger depth profiling of fiber surfaces, and TEM of fiber thin sections, as well as their fracture behavior, bonding characteristics, and interfacial compatibility with various glass-ceramic matrix materials. Results of these analyses are discussed. DTIC

N93-29982# Michigan State Univ., East Lansing. Coll. of Engineering.

RAPIDLY ACTIVATED DYNAMIC PHASE TRANSITIONS IN NONLINEAR SOLIDS Final Report, 1 Aug. 1989 - 15 Dec. 1992

Thomas J. Pence 15 Feb. 1993 22 p

(Contract DAAL03-89-G-0089)

(AD-A263601; ARO-27077.7-MA-SM) Avail: CASI HC A03/MF A01

This research project has addressed critical issues concerned with the mathematical modeling of phase transitions in solids. Detailed microstructural analysis has enabled us to clarify the role of stress waves in the propagation of phase boundaries. The potential for phase boundary movement to damp out stress waves has been demonstrated for certain classes of material response. Nucleation of new phase domains by highly energetic processes has been successfully modeled and new analytical procedures have been developed for the predictive response of phase transforming media during high energy impact. Conversion of mechanical energy to thermal energy has been studied by means of an extended theory which incorporates temperature effects. The role of these dynamical events on the response of devices at the engineering level points to the utility of a mathematical description capable of capturing cumulative microstructural effects. To this end we have also developed mathematical protocols capable of tracking the evolution of thermomechanical austenite/martensite phase variants due to generalized conditions of loading and heating. The associated mathematical model is capable of capturing superelastic response and two-way shape memory in thermoelastic materials. Ohmic heating/convective cooling is a likely activation mechanism for smart devices utilizing these materials, and our numerical simulations have successfully replicated these processes including a smooth transition from isothermal to adiabatic response as the loading rate is increased in a heat convective environment. EFFECT OF WATER IMMERSION ON FIBER/MATRIX ADHESION IN THERMOPLASTIC COMPOSITES

Thomas Juska Mar. 1993 27 p

(AD-A263646; CDNSWC/SSM-64-93/02) Avail: CASI HC A03/MF A01

Continuous fiber reinforced thermoplastics were tested for the effect of water immersion on fiber/matrix adhesion. The materials evaluated were E/PPS, AS4/PPS, E/J2, AS4/J2, S2/PEEK, AS4/PEEK, S2/PEKK, AS4/PEKK, and S2/VECTRA. These materials were tested in uniaxial compression, transverse flexure, and short beam shear, both dry and water-conditioned. Scanning electron microscopy was used to assess the quality of the fiber/matrix bond. The carbon reinforced materials retained adhesion after water immersion. However, the glass reinforced thermoplastics were in general degraded by water, which hydrolyzed the fiber/matrix bond and significantly reduced mechanical properties. DTIC

EXPERIMENT AND ANALYSIS ON ELASTIC DEFORMATION PROPERTIES OF GRAPHITE AND CARBON MATERIALS FOR HTTR CORE COMPONENTS

Taketoshi Arai, Kazuo Minato, Motokuni Eto, Tatsuo Oku, and Shinichi Yoda Jun. 1992 33 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(DE93-753271; JAERI-M-92-085) Avail: CASI HC A03

Fine-grained isotropic graphite grade IG-110, medium-grained near-isotropic graphite grade PGX and coarse-grained baked carbon grade ASR-ORB are employed as structural materials for the High Temperature Engineering Test Reactor (HTTR). The material properties for design are specified in Structural Design Code for Graphite Components of HTTR. This report describes in detail the experiment on deformation behavior including stress-strain relationship, elastic modulas, and Poisson's ratio of each grade. An analytical method for linear elastic approximation leads to the property values contained in the code. DOE

MECHANICAL PROPERTIES OF SEVERAL MAGNESIUM AND ALUMINUM COMPOSITES Final Report

Nikos Tsangarakis and Barmac Taleghani Dec. 1992 16 p

(AD-A262481; ARL-TR-34) Avail: CASI HC A03/MF A01

Several composites of magnesium and aluminum alloys were tested in order to assess and evaluate their mechanical properties. The magnesium alloys were AZ91C, ZE41A, and commercially pure magnesium, reinforced with 40% by volume continuous graphite fiber. The tensile properties of these composites were not superior to those of unreinforced magnesium and estimates of their fracture toughness were low. The matrices of the aluminum composites were 2124-T6, 6061-T4, 2124-T4, and 2219-T4. The reinforcements were either particulate or whiskers of silicon carbide or boron carbide and their volume content was 15% to 30%. The aluminum composites which were reinforced with silicon carbide particulate exhibited improved yield and ultimate tensile stresses, as well as tensile elastic modulus over the unreinforced aluminum alloys. The 2124-T4/B4C/25p composite exhibited the highest ultimate tensile strength which was 511 MPa. The composite which was reinforced with whiskers of silicon carbide exhibited an endurance limit which was 20% higher than that of the matrix alloy. The compressive properties and fracture toughness of some of these aluminum composites were not improved over those of the unreinforced matrix alloy. DTIC

While it sounded great to be asked to talk about composites, I found it difficult to select subject areas that would be of real interest. My choice is based on saying some things about where the maturity of the composite aircraft structures is today and what that means in terms of future criteria for application. This focus was the basis for my title selection. The other issue that will be addressed was requested by NASA and focuses on composites structures cost. This fits well with the state-of-the-art interpretations I will discuss first, since the cost issue must be viewed from both the current status and future points of view. The difficulty in presenting something in these areas is not in the subjects themselves but in trying to present a real world viewpoint to an audience of composite experts. So, with recognition of the expertise of the audience, I hope you will see something in this presentation about how to view composite aircraft structure. Author

Structural weight savings using advanced composites have been demonstrated for many years. Most military aircraft today use these materials extensively and Europe has taken the lead in their use in commercial aircraft primary structures. A major inhibiter to the use of advanced composites in the United States is cost. Material costs are high and will remain high relative to aluminum. The key therefore lies in the significant reduction in fabrication and assembly costs. The largest cost in most structures today is assembly. As part of the NASA Advanced Composite Technology Program, Lockheed Aeronautical Systems Company has a contract to explore and develop advanced structural and manufacturing concepts using advanced composites for transport aircraft. Wing and fuselage concepts and related trade studies are discussed. These concepts are intended to lower cost and weight through the use of innovative material forms, processes, structural configurations and minimization of parts. The approach to the trade studies and the downselect to the primary wing and fuselage concepts is detailed. The expectations for the development of these concepts is reviewed. Author

Boeing's program for Advanced Technology Composite Aircraft Structure (ATCAS) has focused on the manufacturing and performance issues associated with a wide body commercial transport fuselage. The primary goal of ATCAS is to demonstrate cost and weight savings over a 1995 aluminum benchmark. A 31 foot section of fuselage directly behind the wing to body intersection was selected for study purposes. This paper summarizes ATCAS contract plans and review progress to date. The six year ATCAS program will study technical issues for crown, side, and keel areas of the fuselage. All structural details in these areas will be included in design studies that incorporate a design build team (DBT) approach. Manufacturing technologies will be developed for concepts deemed by the DBT to have the greatest potential for cost and weight savings. Assembly issues for large, stiff, quadrant panels will receive special attention. Supporting technologies and mechanical tests will concentrate on the major issues identified for fuselage. These include damage tolerance, pressure containment, splices, load redistribution, post-buckled structure, and durability/life. Progress to date includes DBT selection of baseline fuselage concepts; cost and weight comparisons for crown panel designs; initial panel fabrication for manufacturing and structural mechanics research; and toughened material studies related to keel panels. Initial ATCAS studies have shown that NASA's Advanced Composite Technology program goals for cost and weight savings are attainable for composite fuselage.

Numerous design concepts, materials, and manufacturing methods were investigated analytically and empirically for the covers and spars of a transport wing box. This information was applied to the design, analysis, and fabrication of a full-scale section of a transport wing box. A blade-stiffened design was selected for the upper and lower covers of the box. These covers have been constructed using three styles of AS4/974 prepreg fabrics. The front and rear T-stiffened channel spars were filament wound using AS4/1806 towpreg. Covers, ribs, and spars were assembled using mechanical fasteners. When they are completed later this year, the tests on the technology integration box beam will demonstrate the structural integrity of an advanced composite wing design which is 25 percent lighter than the metal baseline. STRUCTURAL EVALUATION OF CURVED STIFFENED COMPOSITE PANELS FABRICATED USING A THERM-Xsm PROCESS
Christos Kassapoglou (Sikorsky Aircraft, Stratford, CT.), Albert J. DiNicola (Sikorsky Aircraft, Stratford, CT.), Jack C. Chou (Sikorsky Aircraft, Stratford, CT.), and Jerry W. Deaton *In its* First NASA Advanced Composites Technology Conference, Part 1 Jan. 1991 p 207-232 (For primary document see N93-30428 11-24)
(Contract NAS1-18799)
Avail: CASI HC A03/MF A04

The use of composites in aircraft structures is often limited by material and manufacturing costs which, for some designs and applications, are prohibitively high. To increase the frequency of application of composites in primary airframe components alternative manufacturing processes are sought that reduce cost and/or enhance structural efficiency. One alternative process involves the use of THERM-Xsm as the pressure transfer medium during autoclave curing. THERM-Xsm, a silicon-based flow able polymer which behaves like a liquid under autoclave presssure, transmits quasi-hydrostatic pressure to all contacting surfaces of the part to be cured. Once the autoclave pressure is relieved, THERM-Xsm reverts back to the powdery solid state and can be reused many times. The THERM-Xsm process to be evaluated is depicted and consists of (1) enclosing the tool and part to be cured by a set of frames that create a box, (2) pouring THERM-Xsm powder onto the part and filling the box, and (3) placing a vacuum bag over the box assembly. In this program, a separating non-porous film (Teflon) was placed between the part to be cured and THERM-Xsm powder to avoid any contamination. The use of THERM-Xsm has two significant advantages over conventional manufacturing procedures. First, it eliminates complicated hard tooling since it guarantees uniform pressure transfer and thus, good compaction at complex structural details (such as frame-stiffener intersections and corners). Second, it greatly simplifies vacuum bagging, since once the part to be cured is covered by THERM-Xsm powder, the vacuum bag need only conform to a relatively flat shape reducing significantly the number of pleats required. A program is on-going at Sikorsky Aircraft to evaluate the structural performance of complex composite fuselage structures made with this THERM-Xsm process and to quantify the impact of THERM-Xsm on manufacturing labor hours and cost. The program involves fuselage panel optimization analysis, a building block test program where structural details representative of the full-scale article are analyzed and tested, and static and fatigue test/analysis of the full-scale test articles. The main results of this program are reported. Author (revised)

NOISE TRANSMISSION PROPERTIES AND CONTROL STRATEGIES FOR COMPOSITE STRUCTURES
Richard J. Silcox, Todd B. Beyer, and Harold C. Lester *In its* First NASA Advanced Composites Technology Conference, Part 1 Jan. 1991 p 233-246 (For primary document see N93-30428 11-24)
Avail: CASI HC A03/MF A04

A study of several component technologies required to apply active control techniques to reduce interior noise in composite aircraft structures is described. The mechanisms of noise transmission in an all composite, large-scale, fuselage model are studied in an experimental program and found similar to mechanisms found in conventional aircraft construction. Two primary conditions of structural acoustic response are found to account for the dominant interior acoustic response. A preliminary study of active noise control in cylinders used piezoceramic actuators as force inputs for a simple aluminum fuselage model. These actuators provided effective control for the same two conditions of noise transmission found in the composite fuselage structure. The use of piezoceramic actuators to apply force inputs overcomes the weight and structural requirements of conventional shaker actuators. Finally, in order to accurately simulate these types of actuators in a cylindrical shell, two analytical models are investigated that apply either in-plane forces or bending moments along the boundaries of a finite patch. It is shown that the bending model may not be as effective as the force model for exciting the low order azimuthal modes that typically dominate the structural acoustic response in these systems. This result will affect the arrangement and distribution of actuators required for effective active control systems. Author (revised)

LONG DISCONTINUOUS FIBER COMPOSITE STRUCTURE: FORMING AND STRUCTURAL MECHANICS
R. B. Pipes, M. H. Santare, B. J. OToole, A. J. Beaussart, D. C. DeHeer, and R. K. Okine (Du Pont de Nemours, E. I. and Co., Wilmington, DE.) *In* NASA. Langley Research Center, The First NASA Advanced Composites Technology Conference, Part 1 Jan. 1991 p 247-270 (For primary document see N93-30428 11-24)
(Contract NAS1-18758)
Avail: CASI HC A03/MF A04

Cost effective composite structure has motivated the investigation of several new approaches to develop composite structure from innovative material forms. Among the promising new approaches is the conversion of planar sheet to components of complex curvature through sheet forming or stretch forming. In both cases, the potential for material stretch in the fiber direction appears to offer a clear advantage in formability over continuous fiber systems. In the present study, the authors have established a framework which allows the simulation of the anisotropic mechanisms of deformation of long discontinuous fiber laminates wherein the matrix phase is a viscous fluid. The initial study focuses upon the establishment of micromechanics models for prediction of the effective anisotropic viscosities of the oriented fiber assembly in a viscous matrix. Next, the developed constitutive relation is employed through an analogy with incompressible elasticity to exercise the finite element technique for determination of local fiber orientation and laminate thickness after forming. Results are presented for the stretch bending of a curved beam from an arbitrary composite laminate and the bulging of a clamped sheet. Structural analyses are conducted to determine the effect of microstructure on the performance of curved beams manufactured from long discontinuous fiber composites. For the purposes of this study, several curved beams with ideal and non-ideal microstructures are compared for response under pure bending. Material parameters are determined from a separate microstructural analysis.

The use of innovative cost effective material forms and processes is being considered for fabrication of future primary aircraft structures. Processes that have been identified as meeting these goals are textile preforms that use resin transfer molding (RTM) and consolidation forming. The Novel Composites for Wing and Fuselage Applications (NCWFA) program has as its objective the integration of innovative design concepts with cost effective fabrication processes to develop damage-tolerant structures that can perform at a design ultimate strain level of 6000 micro-inch/inch. In this on-going effort, design trade studies were conducted to arrive at advanced wing designs that integrate new material forms with innovative structural concepts and cost effective fabrication methods. The focus has been on minimizing part count (mechanical fasteners, clips, number of stiffeners, etc.), by using cost effective textile reinforcement concepts that provide improved damage tolerance and out-of-plane load capability, low-cost resin transfer molding processing, and thermoplastic forming concepts. The fabrication of representative Y spars by consolidation methods will be described. The Y spars were fabricated using AS4 (6K)/PEEK 150g commingled angle interlock 0/90-degree woven preforms with +45-degree commingled plies stitched using high strength Toray carbon thread and processed by autoclave consolidation. COST STUDIES FOR COMMERCIAL FUSELAGE CROWN DESIGNS

T. H. Walker, P. J. Smith, G. Truslove, K. S. Willden, S. L. Metschan, and C. L. Pfahl *In* NASA. Langley Research Center, The First NASA Advanced Composites Technology Conference, Part 1 Jan. 1991 p 339-355 (For primary document see N93-30428 11-24)
(Contract NAS1-18889)
Avail: CASI HC A03/MF A04

Studies were conducted to evaluate the cost and weight potential of advanced composite design concepts in the crown region of a commercial transport. Two designs from each of three design families were developed using an integrated design-build team. A range of design concepts and manufacturing processes were included to allow isolation and comparison of cost centers. Detailed manufacturing/assembly plans were developed as the basis for cost estimates. Each of the six designs was found to have advantages over the 1995 aluminum benchmark in cost and weight trade studies. Large quadrant panels and cobonded frames were found to save significant assembly labor costs. Comparisons of high- and intermediate-performance fiber systems were made for skin and stringer applications. Advanced tow placement was found to be an efficient process for skin lay up. Further analysis revealed attractive processes for stringers and frames. Optimized designs were informally developed for each design family, combining the most attractive concepts and processes within that family. A single optimized design was selected as the most promising, and the potential for further optimization was estimated. Technical issues and barriers were identified. Author

The Structures Technology Program Office (STPO) at NASA Langley Research Center has held two workshops with representatives from the commercial airframe companies to establish a plan for development of a standard cost reporting format and a cost prediction tool for conceptual and preliminary designers. This paper reviews the findings of the workshop representatives with a plan for implementation of their recommendations. The recommendations of the cost tracking and reporting committee will be implemented by reinstituting the collection of composite part fabrication data in a format similar to the DoD/NASA Structural Composites Fabrication Guide. The process of data collection will be automated by taking advantage of current technology with user friendly computer interfaces and electronic data transmission. Development of a conceptual and preliminary designers' cost prediction model will be initiated. The model will provide a technically sound method for evaluating the relative cost of different composite structural designs, fabrication processes, and assembly methods that can be compared to equivalent metallic parts or assemblies. The feasibility of developing cost prediction software in a modular form for interfacing with state of the art preliminary design tools and computer aided design (CAD) programs is assessed. LESSONS LEARNED FOR COMPOSITE STRUCTURES

R. S. Whitehead *In* NASA. Langley Research Center, The First NASA Advanced Composites Technology Conference, Part 1 Jan. 1991 p 399-415 (For primary document see N93-30428 11-24)
Avail: CASI HC A03/MF A04

Lessons learned for composite structures are presented in three technology areas: materials, manufacturing, and design. In addition, future challenges for composite structures are presented. Composite materials have long gestation periods from the developmental stage to fully matured production status. Many examples exist of unsuccessful attempts to accelerate this gestation period. Experience has shown that technology transition of a new material system to fully matured production status is time consuming, involves risk, is expensive and should not be undertaken lightly. The future challenges for composite materials require an intensification of the science based approach to material development, extension of the vendor/customer interaction process to include all engineering disciplines of the end user, reduced material costs because they are a significant factor in overall part cost, and improved batch-to-batch pre-preg physical property control. Historical manufacturing lessons learned are presented using current in-service production structure as examples. Most producibility problems for these structures can be traced to their sequential engineering design. This caused an excessive emphasis on design-to-weight and schedule at the expense of design-to-cost. This resulted in expensive performance originated designs, which required costly tooling and led to non-producible parts. Historically these problems have been allowed to persist throughout the production run. The current/future approach for the

production of affordable composite structures mandates concurrent engineering design where equal emphasis is placed on product and process design. Design for simplified assembly is also emphasized, since assembly costs account for a major portion of total airframe costs. The future challenge for composite manufacturing is, therefore, to utilize concurrent engineering in conjunction with automated manufacturing techniques to build affordable composite structures. Composite design experience has shown that significant weight savings have been achieved, outstanding fatigue and corrosion resistance have been demonstrated, and in-service performance has been very successful. Currently no structural design show stoppers exist for composite structures. A major lesson learned is that the full scale static test is the key test for composites, since it is the primary structural 'hot spot' indicator. The major durability issue is supportability of thin skinned structure. Impact damage has been identified as the most significant issue for the damage tolerance control of composite structures. However, delaminations induced during assembly operations have demonstrated a significant nuisance value. The future challenges for composite structures are threefold. Firstly, composite airframe weight fraction should increase to 60 percent. At the same time, the cost of composite structures must be reduced by 50 percent to attain the goal of affordability. To support these challenges it is essential to develop lower cost materials and processes.

PRELIMINARY PROPERTIES OF A RESIN FROM ETHYNYL TERMINATED MATERIALS

Paul M. Hergenrother and John W. Connell *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 419-424
(For primary document see N93-30841 11-24)
Avail: CASI HC A02/MF A06

A blend composed of an ethynyl terminated aspartimide (brittle component) and an ethynyl terminated arylene ether oligomer (tough component) was thermally cured to yield a resin which underwent preliminary evaluation to determine the potential for use in structural applications on aerospace vehicles. The blend exhibited good compression moldability, allowing for fabrication of neat moldings, adhesive specimens and composites at temperatures of 250 C under a pressure of 1.4 MPa (200 psi). Neat resin moldings and adhesive specimens provided relatively high mechanical properties. Composite specimens provided promising results in spite of fiber misalignment, fiber washout, and a small amount of panel warpage.

Kranbuehl (College of William and Mary, Williamsburg, VA.), Philip J. Kinsley (College of William and Mary, Williamsburg, VA.), and Sean M. Hart (College of William and Mary, Williamsburg, VA.) *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 425-441 (For primary document see N93-30841 11-24)
(Grants NAG1-343; NAG1-237)
Avail: CASI HC A03/MF A06

A model was developed which can be used to simulate infiltration and cure of textile composites by resin transfer molding. Fabric preforms were resin infiltrated and cured using model generated optimized one-step infiltration/cure protocols. Frequency dependent electromagnetic sensing (FDEMS) was used to monitor in situ resin infiltration and cure during processing. FDEMS measurements of infiltration time, resin viscosity, and resin degree of cure agreed well with values predicted by the simulation model. Textile composites fabricated using a one-step infiltration/cure procedure were uniformly resin impregnated and void free. Fiber volume fraction measurements by the resin digestion method compared well with values predicted using the model. Author

POWDER TOWPREG PROCESS DEVELOPMENT

Robert M. Baucom and Joseph M. Marchello (Old Dominion Univ., Norfolk, VA.) *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 443-454 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

The process for dry powder impregnation of carbon fiber tows being developed at LaRC overcomes many of the difficulties associated with melt, solution, and slurry prepregging. In the process, fluidized powder is deposited on spread tow bundles and fused to the fibers by radiant heating. Impregnated tows have been produced for preform, weaving, and composite materials applications. Design and operating data correlations were developed for scale up of the process to commercial operation. Bench scale single tow experiments at tow speeds up to 50 cm/sec have demonstrated that the process can be controlled to produce weavable towpreg. Samples were woven and molded into preform material of good quality.

EFFECTS OF INTRA- AND INTER-LAMINAR RESIN CONTENT ON THE MECHANICAL PROPERTIES OF TOUGHENED COMPOSITE MATERIALS

Dodd H. Grande, Larry B. Ilcewicz, William B. Avery (Boeing Co., Seattle, WA.), and Willard D. Bascom (Utah Univ., Salt Lake City.) *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 455-475 (For primary document see N93-30841 11-24)
(Contract NAS1-18889)
Avail: CASI HC A03/MF A06

Composite materials having multiphase toughened matrix systems and laminate architectures characterized by resin-rich interlaminar layers (RIL) have been the subject of much recent attention. Such materials are likely to find applications in thick compressively loaded structures such as the keel area of commercial aircraft fuselages. The effects of resin content and its interlaminar and intralaminar distribution on mechanical properties were investigated with test and analysis of two carbon-epoxy systems. The RIL was found to reduce the in situ strengthening effect for matrix cracking in laminates. Mode 2 fracture toughness was found to increase with increasing RIL thickness over the range investigated, and Mode 1 interlaminar toughness was negligibly affected. Compressive failure strains were found to increase with increasing resin content for specimens having no damage, holes, and impact damage. Analytical tools for predicting matrix cracking of off-axis plies and damage tolerance in compression after impact (CAI) were successfully applied to materials with RIL. Author (revised)

STUDIES OF FIBER-MATRIX ADHESION ON COMPRESSION STRENGTH
Willard D. Bascom, John A. Nairn, and D. J. Boll (Hercules, Inc., Magna, UT.) *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 477-495 (For primary document see N93-30841 11-24)
(Contract NAS1-18883)
Avail: CASI HC A03/MF A06

A study was initiated on the effect of the matrix polymer and the fiber matrix bond strength of carbon fiber polymer matrix composites. The work includes tests with micro-composites, single ply composites, laminates, and multi-axial loaded cylinders. The results obtained thus far indicate that weak fiber-matrix adhesion dramatically reduces 0 degree compression strength. Evidence is also presented that the flaws in the carbon fiber that govern compression strength differ from those that determine fiber tensile strength. Examination of post-failure damage in the single ply tests indicates kink banding at the crack tip. Author (revised)

THE INITIATION, PROPAGATION, AND EFFECT OF MATRIX MICROCRACKS IN CROSS-PLY AND RELATED LAMINATES
John A. Nairn, Shoufeng Hu, Siulie Liu, and Jong Bark *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 497-512 (For primary document see N93-30841 11-24)
(Contract NAS1-18833)
Avail: CASI HC A03/MF A06

Recently, a variational mechanics approach was used to determine the thermoelastic stress state in cracked laminates. Described here is a generalization of the variational mechanics techniques to handle other cross-ply laminates, related laminates, and to account for delaminations emanating from microcrack tips. Microcracking experiments on Hercules 3501-6/AS4 carbon fiber/epoxy laminates show a staggered cracking pattern. These results can be explained by the variational mechanics analysis. The analysis of delaminations emanating from microcrack tips has resulted in predictions about the structural and material variables controlling competition between microcracking and delamination failure modes. COMPARISON OF IMPACT RESULTS FOR SEVERAL POLYMERIC COMPOSITES OVER A WIDE RANGE OF LOW IMPACT VELOCITIES
C. C. Poe, Jr., M. A. Portanova (Lockheed Engineering and Sciences Co., Hampton, VA.), J. E. Masters (Lockheed Engineering and Sciences Co., Hampton, VA.), B. V. Sankar (Florida Univ., Gainesville.), and Wade C. Jackson (Army Aerostructures Directorate, Hampton, VA.) *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 513-547 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

Static indentation, falling weight, and ballistic impact tests were conducted in clamped plates made of AS4/3501-6 and IM7/8551-7 prepreg tape. The transversely isotropic plates were nominally 7-mm thick. Pendulum and ballistic tests were also conducted on simply supported plates braided with Celion 12000 fibers and 3501-6 epoxy. The 20 degree braided plates were about 5-mm thick. The impactors had spherical or hemispherical shapes with a 12.7 mm diameter. Residual compression strength and damage size were measured. For a given kinetic energy, damage size was least for IM7/8551-7 and greatest for the braided material. Strengths varied inversely with damage size. For a given damage size, strength loss as a fraction of original strength was least for the braided material and greatest for AS4/3501-6 and IM7/8551-7. Strength loss for IM7/8551-7 and AS4/3501-6 was nearly equal. No significant differences were noticed between damage sizes and residual compression strengths for the static indentation, falling weight, and ballistic tests of AS4/3501-6 and IM7/8551-7. For the braided material, sizes of damage were significantly less and compression strengths were significantly more for the falling weight tests than for the ballistic tests. Author (revised)

DELAMINATIONS IN COMPOSITE PLATES UNDER IMPACT LOADS
Scott R. Finn and George S. Springer *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 549-577 (For primary document see N93-30841 11-24)
(Contract NAS1-18778)
Avail: CASI HC A03/MF A06

A method is presented for calculating the locations, shapes, and sizes of delaminations which occur in a fiber reinforced composite plate subjected to non-penetrating (low velocity) impact of a solid object. The plate may be simply supported, clamped, or free along its edges. A failure model of the delamination formation was developed. This model was then coupled with a finite element analysis. The model and the finite element analysis were then implemented by a computer code (IMPACT-ST) which can be used to estimate the damage initiation load and the locations, shapes, and sizes of the delaminations. Tests were performed measuring the geometries of the delaminations in graphite-epoxy, graphite-toughened epoxy, and graphite-PEEK plates impacted by a projectile with a spherical tip having masses ranging from 0.355 lbm to 0.963 lbm and velocities from 50 in/sec to 225 in/sec. The data were compared to the results of the model, and good agreements were found between the measured and the calculated delamination lengths and widths. Author

MICROMECHANICS OF FATIGUE IN WOVEN AND STITCHED COMPOSITES
B. N. Cox, M. S. Dadkhah, R. V. Inman, M. R. Mitchell, W. L. Morris, and S. Schroeder *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 579-587 (For primary document see N93-30841 11-24)
(Contract NAS1-18840)
Avail: CASI HC A02/MF A06

The goal is to determine how microstructural factors, especially the architecture of microstructural factors, control fatigue damage in 3D reinforced polymer composites. Test materials were fabricated from various preforms, including stitched quasi-isotropic laminates, and through-the-thickness angle interlock, layer-to-layer angle interlock, and through-the-thickness stitching effect weaves. Preforms were impregnated with a tough resin by a special vacuum infiltration method. Most tests are being performed in uniaxial compression/compression loading. In all cases to date, failure has occurred not by delamination, but by shear failure, which occurs suddenly rather than by gradual macroscopic crack growth. Some theoretical aspects of bridging are also examined. Author (revised)

CHARACTERIZATION OF MULTIAXIAL WARP KNIT COMPOSITES
H. Benson Dexter, Gregory H. Hasko (Lockheed Engineering and Sciences Co., Hampton, VA.), and Roberto J. Cano *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 589-619 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

The objectives were to characterize the mechanical behavior and damage tolerance of two multiaxial warp knit fabrics to determine the acceptability of these fabrics for high performance composite applications. The tests performed included compression, tension, open hole compression, compression after impact and compression-compression fatigue. Tests were performed on as-fabricated fabrics and on multi-layer fabrics that were stitched together with either carbon or Kevlar stitching yarn. Results of processing studies for vacuum impregnation with Hercules 3501-6 epoxy resin and pressure impregnation with Dow Tactix 138/H41 epoxy resin and British Petroleum BP E905L epoxy resin are presented. DEVELOPMENT OF STITCHING REINFORCEMENT FOR TRANSPORT WING PANELS

Raymond J. Palmer (Douglas Aircraft Co., Inc., Huntington Beach, CA.), Marvin B. Dow, and Donald L. Smith (Lockheed Engineering and Sciences Co., Hampton, VA.) *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 621-646 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

The NASA Advanced Composites Technology (ACT) program has the objective of providing the technology required to obtain the full benefit of weight savings and performance improvements offered by composite primary aircraft structures. Achieving the objective is dependent upon developing composite materials and structures which are damage tolerant and economical to manufacture. Researchers are investigating stitching reinforcement combined with resin transfer molding to produce materials meeting the ACT program objective. Research is aimed at materials, processes, and structural concepts for application in both transport wings and fuselages, but the emphasis to date has been on wing panels. Empirical guidelines are being established for stitching reinforcement in structures designed for heavy loads. Results are presented from evaluation tests investigating stitching types, threads, and density (penetrations per square inch). Tension strength, compression strength, and compression after impact data are reported. Author

ADVANCED FIBER/MATRIX MATERIAL SYSTEMS

J. Timothy Hartness *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 659-676 (For primary document see N93-30841 11-24)
(Contract NAS1-18834)
Avail: CASI HC A03/MF A06

Work completed in Phase 1 of the NASA Advanced Composite Technology program is discussed. Two towpreg forms (commingled yarns and fused powder towpregs) are being characterized under the program. These towpregs will be used to evaluate textile fabrication technologies for advanced aircraft composite structures. The unique characteristic of both of these material forms is that both fiber and matrix resin are handled in a single operation such as weaving, braiding, or fiber placement. The evaluation of both commingled and fused powder towpreg is described. Various polymer materials are considered for both subsonic and supersonic applications. Polymers initially being evaluated include thermoplastic polyimides such as Larc-TPI and New-TPI, thermoplastics such as PEEK and PEKEKK as well as some toughened crosslinked polyimides. Preliminary mechanical properties as well as tow handling are evaluated. Author

MECHANICAL AND ANALYTICAL SCREENING OF BRAIDED COMPOSITES FOR TRANSPORT FUSELAGE APPLICATIONS

Mark J. Fedro, Christian Gunther, and Frank K. Ko (Drexel Univ., Philadelphia, PA.) *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 677-704 (For primary document see N93-30841 11-24)
(Contract NAS1-18889)
Avail: CASI HC A03/MF A06

The mechanics of materials progress in support of the goal of understanding the application of braided composites in a transport aircraft fuselage are summarized. Composites consisting of both 2-D and 3-D braid patterns are investigated. Both consolidation of commingled graphite/PEEK and resin transfer molding of graphite-epoxy braided composite processes are studied. Mechanical tests were used to examine unnotched tension, open hole tension, compression, compression after impact, in-plane shear, out-of-plane tension, bearing, and crippling. Analytical methods are also developed and applied to predict the stiffness and strengths of test specimens. A preliminary study using the test data and analytical results is performed to assess the applicability of braided composites to a commercial aircraft fuselage. Author

ULTRASONIC DETECTION AND IDENTIFICATION OF FABRICATION DEFECTS IN COMPOSITES

Edward R. Long, Jr., Susan M. Kullerd, Patrick H. Johnston, and Eric I. Madaras *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 705-720 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

Methods for deliberate fabrication of porosity into carbon/epoxy composite panels and the influence of three-dimensional stitching on the detection of porosity were investigated. Two methods of introducing porosity were investigated. Porosity was simulated by inclusion of glass microspheres, and a more realistic form of porosity was introduced by using low pressure during consolidation. The panels were ultrasonically scanned and the frequency slope of the ultrasonic attenuation coefficient was used to evaluate the two forms of porosity. The influence of stitching on the detection of porosity was studied using panels which were resin transfer molded from stitched plies of knitted carbon fabric and epoxy resin. Author

DEVELOPMENTS IN IMPACT DAMAGE MODELING FOR LAMINATED COMPOSITE STRUCTURES

Ernest F. Dost, William B. Avery, Gary D. Swanson, and Kuen Y. Lin (Washington Univ., Seattle.) *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 721-736 (For primary document see N93-30841 11-24)
(Contract NAS1-18889)
Avail: CASI HC A03/MF A06

Damage tolerance is the most critical technical issue for composite fuselage structures studied in the Advanced Technology Composite Aircraft Structures (ATCAS) program. The objective here is to understand both the impact damage resistance and residual strength of the laminated composite fuselage structure. An understanding of the different damage mechanisms which occur during an impact event will support the selection of materials and structural configurations used in different fuselage quadrants and guide the development of analysis tools for predicting the residual strength of impacted laminates. Prediction of the damage state along with the knowledge of post-impact response to applied loads will allow for engineered stacking sequencies and structural configurations; intelligent decisions on repair requirements will also result. COMPARISON OF HAND LAID-UP TAPE AND FILAMENT WOUND COMPOSITE CYLINDERS AND PANELS WITH AND WITHOUT IMPACT DAMAGE
Dawn C. Jegley and Osvaldo F. Lopez *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 749-759 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

The results of this experimental comparison of filament wound control (unimpacted) cylinders loaded to failure in axial compression indicates that one fiber cross-over location has no effect on the failure mode or strain in thick walled filament wound graphite-epoxy specimens with stacking sequence (plus or minus 45/90) sub 3s. A comparison between filament wound and hand laid-up tape control cylinders indicates that there is little or no difference in the response of cylinders constructed by using two different fabrication methods, however, unimpacted panels with many fiber cross-overs fail at up to 15 percent lower strains than panels with no fiber cross-overs. A comparison of samples subjected to low speed impact damage prior to compressive loading indicates that impact damage reduces the strain at failure by over 60 percent in tape and filament wound graphite-epoxy cylinders and in tape flat panels. The presence of fiber cross-overs was observed to reduce the strength of filament wound impact-damaged panels, but to have no significant effect on the strength of filament wound impact-damaged cylinders. EFFECTS OF SCALE IN PREDICTING GLOBAL STRUCTURAL RESPONSE
R. B. Deo and H. P. Kan *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 761-777 (For primary document see N93-30841 11-24)
(Contract NAS1-18842)
Avail: CASI HC A03/MF A06

Analytical techniques for scale-up effects were reviewed. The advantages and limitations of applying the principles of similitude to composite structures is summarized and illustrated by simple examples. An analytical procedure was formulated to design scale models of an axially compressed composite cylinder. A building-block approach was outlined where each structural detail is analyzed independently and the probable failure sequence of a selected component is predicted, taking into account load redistribution subsequent to first element failure. Details of this building-block approach are under development. Author

OPTIMIZATION OF COMPOSITE SANDWICH COVER PANELS SUBJECTED TO COMPRESSIVE LOADINGS
Juan R. Cruz *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 791-807 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

An analysis and design method is presented for the design of composite sandwich cover panels that includes transverse shear effects and damage tolerance considerations. This method is incorporated into an optimization program called SANDOP (SANDwich OPtimization). SANDOP is used in the present study to design optimized composite sandwich cover panels for transport aircraft wing applications as a demonstration of its capabilities. The results of this design study indicate that optimized composite sandwich cover panels have approximately the same structural efficiency as stiffened composite cover panels designed to identical constraints. Results indicate that inplane stiffness requirements have a large effect on the weight of these composite sandwich cover panels at higher load levels. Increasing the maximum allowable strain and the upper percentage limit of the 0 degree and plus or minus 45 degree plies can yield significant weight savings. The results show that the structural efficiency of these optimized composite sandwich cover panels is relatively insensitive to changes in core density. Author (revised)

A COMPARISON OF CLASSICAL MECHANICS MODELS AND FINITE ELEMENT SIMULATION OF ELASTICALLY TAILORED WING BOXES
Lawrence W. Rehfield, Richard D. Pickings, Stephen Chang, and Michael Holl *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 809-815 (For primary document see N93-30841 11-24)
Avail: CASI HC A02/MF A06

Structural tailoring concepts were developed to create wings with elastically produced camber for the purpose of increasing lift during takeoff conditions. Simple models based upon enhancements to the thin walled composite beam theory of Rehfield were developed to investigate prospects for elastic tailoring of the chordwise deformation of wing structures. The purpose here is to provide a comparison of the theoretical results with a finite element model for the bending method of producing camber. Finite element correlation studies were completed for two cases: a bonded unstiffened structural box, and a bolted unstiffened structural box. Results from these studies show an error of less than one percent for the bonded case and less than six percent for the bolted case in predicting camber curvature for the structural box. Examination of the results shows that the theory is very accurate for the cases studied and will provide an excellent basis for conducting further tailoring studies. Author

PROCESS AND ASSEMBLY PLANS FOR LOW COST COMMERCIAL FUSELAGE STRUCTURE
Kurtis Willden, Stephen Metschan, and Val Starkey *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 831-842 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

Cost and weight reduction for a composite structure is a result of selecting design concepts that can be built using efficient low cost manufacturing and assembly processes. Since design and manufacturing are inherently cost dependent, concurrent engineering in the form of a Design-Build Team (DBT) is essential for low cost designs. Detailed cost analysis from DBT designs and hardware verification must be performed to identify the cost drivers and relationships between design and manufacturing processes. Results from the global evaluation are used to quantitatively rank design, identify cost centers for higher ranking design concepts, define and prioritize a list of technical/economic issues and barriers, and identify parameters that control concept response. These results are then used for final design optimization. Author

MULTIPLE METHODS INTEGRATION FOR STRUCTURAL MECHANICS ANALYSIS AND DESIGN

J. M. Housner and M. A. Aminpour (Analytical Services and Materials, Inc., Hampton, VA.) *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 875-889 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

A new research area of multiple methods integration is proposed for joining diverse methods of structural mechanics analysis which interact with one another. Three categories of multiple methods are defined: those in which a physical interface are well defined; those in which a physical interface is not well-defined, but selected; and those in which the interface is a mathematical transformation. Two fundamental integration procedures are presented that can be extended to integrate various methods (e.g., finite elements, Rayleigh Ritz, Galerkin, and integral methods) with one another. Since the finite element method will likely be the major method to be integrated, its enhanced robustness under element distortion is also examined and a new robust shell element is demonstrated. PROBABILISTIC COMPOSITE ANALYSIS

C. C. Chamis and P. L. N. Murthy *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 891-900 (For primary document see N93-30841 11-24)
Avail: CASI HC A02/MF A06

Formal procedures are described which are used to computationally simulate the probabilistic behavior of composite structures. The computational simulation starts with the uncertainties associated with all aspects of a composite structure (constituents, fabrication, assembling, etc.) and encompasses all aspects of composite behavior (micromechanics, macromechanics, combined stress failure, laminate theory, structural response, and tailoring) optimization. Typical cases are included to illustrate the formal procedure for computational simulation. The collective results of the sample cases demonstrate that uncertainties in composite behavior and structural response can be probabilistically quantified. Author

A RAYLEIGH-RITZ ANALYSIS METHODOLOGY FOR CUTOUTS IN COMPOSITE STRUCTURES

Steven G. Russell *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 901-920 (For primary document see N93-30841 11-24)
(Contract NAS1-18842)
Avail: CASI HC A03/MF A06

A new Rayleigh-Ritz stress analysis methodology that was developed for composite panels containing cutouts is described. The procedure, which makes use of a general assumed displacement field, accommodates circular and elliptical cutouts in biaxially loaded rectangular composite panels. Symmetric integral padups around the cutout can be included in the analysis. Benchmark results are presented to demonstrate the accuracy of the technique. Strength predictions based on the average stress criterion are generated and compared with experimental data. Finally, the stress analysis methodology is integrated into a design procedure for sizing integral padups around circular cutouts, and a sample problem is solved to illustrate its use. Author

EFFECTS OF BOLT-HOLE CONTACT ON BEARING-BYPASS DAMAGE-ONSET STRENGTH

John H. Crews, Jr. and Rajiv A. Naik (Analytical Services and Materials, Inc., Hampton, VA.) *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 921-937 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

A combined experimental and analytical study was conducted to investigate the effects of bolt-hole contact on the bearing bypass strength of a graphite-epoxy laminate. Tests were conducted on specimens consisting of 16-ply quasi-isotropic T300/5208 laminates with a centrally located hole. Bearing loads were applied through a clearance-fit steel bolt. Damage onset strength and damage mode were determined for each test case. A finite element procedure was used to calculate the bolt-hole stresses and bolt contact for each test case. A finite element procedure was used to calculate the bolt-hole stresses and bolt contact for each measured damage-onset strength. For the tension bearing-bypass cases tested, the bolt contact half-angle was approximately 60 degrees at damage onset. For compression, the contact angle was 20 degrees as the bypass load increased. A corresponding decrease in the bearing damage onset strength was attributed to the decrease in contact angle which made the bearing loads more severe. Hole boundary stresses were also computed by superimposing stresses for separate bearing and bypass loading. Stresses at the specimen net section were accurately approximated by the superposition procedure. However, the peak bearing stresses had large errors because the bolt contact angles were not represented correctly. For compression, peak bearing stress errors of nearly 50 percent were calculated. PREDICTION OF STIFFENER-SKIN SEPARATION IN COMPOSITE PANELS

Han-Pin Kan, Mary A. Mahler, and Ravi B. Deo *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 939-952 (For primary document see N93-30841 11-24)
(Contract NAS1-18842)
Avail: CASI HC A03/MF A06

A methodology was developed to predict the failure of stiffened composite panels by stiffener-skin separation. The methodology is applicable to curved or flat panels under combined uniaxial compression and in-plane shear loads. The analytical crux of the methodology are two different analysis packages: PACL1, which predicts the stress and displacement fields in a stiffened postbuckled panel; and WEBSTER, which predicts the local interfacial (shear and normal) stresses at the skin and stiffener flange junction. PACL1 is a Rayleigh-Ritz analysis of curved composite panels loaded into a post-buckling range. WEBSTER is a two-dimensional elasticity analysis for the skin-stiffener interface. Results of the predictive methodology are given. Author (revised)

EXPERIMENTAL BEHAVIOR OF GRAPHITE-EPOXY Y-STIFFENED SPECIMENS LOADED IN COMPRESSION

P. D. Sydow and M. J. Shuart *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 953-968 (For primary document see N93-30841 11-24)
Avail: CASI HC A03/MF A06

An experimental investigation of the behavior of graphite-epoxy

Y-stiffened specimens loaded in compression is presented. Experimental results are presented for element specimens with a single stiffener and for panel specimens with three stiffeners. Response and failure characteristics of the specimens are described. Effects of impact damage on structural response for both specimen configurations are also presented. Results indicate that impact location may significantly affect the residual strength of the Y-stiffened specimens. The failure results indicate that the critical failure mode is buckling of the stiffener webs for Y-stiffened element specimens and buckling of both stiffener web and stiffener blade for the Y-stiffened panel specimens. Author (revised)

STRUCTURAL RESPONSE OF BEAD-STIFFENED THERMOPLASTIC SHEAR WEBS

Marshall Rouse *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 969-977 (For primary document see N93-30841 11-24)

Avail: CASI HC A02/MF A06

The results of an experimental and analytical study of the structural response and failure characteristics of selected bead-stiffened thermoplastic shear-webs are presented. Results are given for specimens with one stiffeneer, with two stiffeners, and different stiffener geometries. Selected analytical results that were obtained with the Computational Structural Mechanics (CSM) Testbed computer code are presented. Analytical results that describe normal and transverse shear stress are also presented. Author

EVALUATION OF SOME SCALE EFFECTS IN THE RESPONSE AND FAILURE OF COMPOSITE BEAMS

Karen E. Jackson and John Morton (Virginia Polytechnic Inst. and State Univ., Blacksburg.) *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 979-1003 (For primary document see N93-30841 11-24)

Avail: CASI HC A03/MF A06

The feasibility of using scale model testing for predicting full-scale behavior of composite beams loaded in tension and flexure was investigated. Classical laws of similitude were applied to fabricate and test replica model beams to identify scaling effects in the load response, strength, and mode of failure. Experiments were conducted using graphite-epoxy composite beams having different laminate stacking sequences and a range of scaled sizes. Results indicated that the elastic response of scaled composite beams was independent of specimen size. However, a significant scale effect in strength was observed. In addition, a transition in failure mode was observed among scaled beams of certain laminate stacking sequences. Weibull statistical and fracture mechanics based models were applied to predict the strength scale effect since standard failure criteria cannot account for the influence of absolute specimen size in failure. AN OVERVIEW OF THE CRASH DYNAMICS FAILURE BEHAVIOR OF METAL AND COMPOSITE AIRCRAFT STRUCTURES

Huey D. Carden, Richard L. Boitnott (Army Aerostructures Directorate, Hampton, VA.), Edwin L. Fasanella (Lockheed Engineering and Sciences Co., Hampton, VA.), and Lisa E. Jones (Lockheed Engineering and Sciences Co., Hampton, VA.) *In its* First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 1005-1035 (For primary document see N93-30841 11-24)

Avail: CASI HC A03/MF A06

An overview of failure behavior results is presented from some of the crash dynamics research conducted with concepts of aircraft elements and substructure not necessarily designed or optimized for energy absorption or crash loading considerations. Experimental and analytical data are presented that indicate some general trends in the failure behavior of a class of composite structures that includes fuselage panels, individual fuselage sections, fuselage frames, skeleton subfloors with stringers and floor beams without skin covering, and subfloors with skin added to the frame stringer structure. Although the behavior is complex, a strong similarity in the static/dynamic failure behavior among these structures is illustrated through photographs of the experimental results and through analytical data of generic composite structural models. TAILORED COMPOSITE WINGS WITH ELASTICALLY PRODUCED CHORDWISE CAMBER

Lawrence W. Rehfield, Stephen Chang, Peter J. Zischka, Richard D. Pickings, and Michael W. Holl *In* NASA. Langley Research Center, First NASA Advanced Composites Technology Conference, Part 2 Jan. 1991 p 1037-1047 (For primary document see N93-30841 11-24)
(Contract NAS1-18754)

Avail: CASI HC A03/MF A06

Four structural concepts were created which produce chordwise camber deformation that results in enhanced lift. A wing box can be tailored to utilize each of these with composites. In attempting to optimize the aerodynamic benefits, researchers found that there are two optimum designs that are of interest. There is a weight optimum which corresponds to the maximum lift per unit structural weight. There is also a lift optimum that corresponds to maximum absolute lift. Experience indicates that a large weight penalty accompanies the transition from weight to lift optimum designs. New structural models, the basic deformation mechanisms that are utilized, and typical analytical results are presented. It appears that lift enhancements of sufficient magnitude can be produced to render this type of wing tailoring of practical interest. Author

DAMAGE OF MULTI-DIRECTIONALLY REINFORCED CERAMIC-MATRIX COMPOSITES Ph.D. Thesis

Wen-Shyong Kuo 1992 232 p

Avail: Univ. Microfilms Order No. DA9301765

Ceramic-matrix composites (CMC's) reinforced with continuous fibers exhibit important progressive damage/failure behavior. The performance of CMC's and their damage mechanisms depends on material processing techniques, external loading, and the arrangement of reinforcements. Relationships between constituent properties, fiber arrangements, and the progressive damage behavior of multi-directionally reinforced CMC's, including (1) unidirectional composites, (2) cross-ply composites, and (3) woven fabric composites are studied. The material systems examined include C/borosilicate glass and SiC/CAS unidirectional, SiC/CAS cross-ply, and SiC/SiC woven fabric composites. For unidirectional CMC's, a partial debonding model is introduced. Thermomechanical behavior, with an emphasis on matrix cracking, is examined. The influence of debonding length on the problem is studied through the model. By using an energy balance method two closed form solutions of the critical strains for matrix cracking were obtained. The effects of interface properties, fiber/matrix sliding, matrix surface energy, and fiber volume fraction on the damage of the composite were investigated. For cross-ply CMC's, two kinds of microcracking were observed: transverse cracking in the 90 deg-ply and matrix cracking in the 0 deg-ply with fiber bridging. Through combinations of these two types of microcracking, five damage modes, including one transverse crack and four matrix cracks, are studied. Matrix cracking in the 0 deg-ply is a unique feature of cross-ply CMC's. Using the energy balance method, closed-form equations of critical stresses for the damage modes were obtained. It can be shown that the four matrix cracking equations for cross-ply CMC's reduce to those two for unidirectional CMC's as the thickness of the 90 deg-ply vanishes. The relation between composite performance (stiffness, strength and yielding strain and nonlinear behavior) and constituent properties (thicknesses, thermal properties, surface energies, interfacial shear stress, and fiber volume fraction) was studied. The damage evolution and nonlinear tensile behavior of 2-D woven fabric Nicalon-fiber-reinforced SiC-matrix composites fabricated by chemical vapor infiltration (CVI) were examined. The effect of inter- and intra-yarn pores due to CVI processing and the effect of fiber undulation were stated. The nonlinear portion of the stress strain responses is due to transverse cracks initiated at inter-yarn pores. Strain energy release rates of the cracks in transverse and longitudinal yarns were calculated by a finite element method and a crack closure approach. The results indicate that the composite stiffness reduction due to fiber undulation is insignificant for the SiC/SiC composite. However, the porosity is important to composite stiffness, due to the high-modulus ceramic matrix. The results of strain energy release rates show that using thinner fiber yarns can lead to smaller pores and higher critical stress for transverse cracking. Dissert. Abstr.

Line-of-sight Fourier transform infrared absorption spectra through a 17-torr methane/nitrous oxide flame have been tomographically analyzed using Abel's equations. Relative absorbances for N2O, CH4, CO2, NO, and CO have been mapped for various 'slices' of the flame at different heights in the flame. Results indicate that the region of maximum NO and CO formation occurs prior to the luminous region of the flame. The technique is shown to be useful in obtaining data from systems for which line of sight data may be unusable. DTIC

The goal is to elucidate and understand the surface chemistry and catalytic properties of well-defined, highly-reactive organometallic molecules (principally based upon abundant actinide, lanthanide, and early transition elements) adsorbed on metal oxides and halides. Nature of adsorbed species is probed by a battery of chemical and physicochemical techniques, to understand the nature of the molecule-surface coordination chemistry and how this can give rise to extremely high catalytic activity. A complementary objective is to delineate the scope and mechanisms of the heterogeneous catalytic reactions, as well as to relate them both conceptually and functionally to model systems generated in solution. Preliminary investigations of these manganese oxide materials show that the different oxides exhibit different selectivity toward methanol and other products. It seems that there is a correlation between the initial O/Mn ratio of the oxide and methanol selectivity. These conclusions are supported by the results. The main product of the manganese oxide-catalyzed CO hydrogenation is methanol except on Mao, which shows the lowest methanol selectivity, but the highest CO2 yield. Preliminarily, the results suggest that the higher the O/Mn ratio of the precursor oxide, the higher will be the methanol selectivity, while the CO2 and methane selectivities will be lower. The higher CO2 and C2, C3, and C4 hydrocarbon selectivities over the Mao catalyst compared to the other manganese oxides tested, indicates that Mao acts more like a water-gas shift and Fischer-Tropsch catalyst. Laser Raman spectroscopy is a very versatile tool for chemical characterization of micron-sized particles. Such particles are abundant in nature and in numerous energy-related processes. In order to elucidate the formation mechanisms and understand the subsequent chemical transformation under a variety of reaction conditions, it is imperative to develop analytical measurement techniques for in situ monitoring of these suspended particles. In this report, we outline our recent work on spontaneous Raman, resonance Raman, and non-linear Raman scattering as a novel technique for chemical analysis of aerosol particles as well as supersaturated solution droplets. MEMBRANE-BASED PHOTOCHEMICAL SYSTEMS AS MODELS FOR PHOTOSYNTHETIC CELLS

J. K. Hurst 1992 19 p
(Contract DE-FG06-87ER-13664)
(DE93-009758; DOE/ER-13664/6) Avail: CASI HC A03/MF A01

The objectives of this research are to improve our conceptual view of the ways in which membranes and interfaces can be used to control chemical reactivity. We have focused on understanding three elementary processes that are central to developing membrane-based integrated chemical systems for water photolysis or related photoconversion/photostorage processes. Specifically, we have sought to identify: the influence of interfaces upon charge separation/recombination reactions, pathways for transmembrane charge separation across hydrocarbon bilayer membranes, and mechanisms of water oxidation catalyzed by transition metal coordination complexes. Historically, the chemical dynamics of each of these processes has been poorly understood, with numerous unresolved issues and conflicting viewpoints appearing in the literature. As described in this report our recent research has led to considerable clarification of the underlying reaction mechanisms. DOE

Arrays containing greater than 10(exp 9) 2000A-diameter CdSe or graded CdSe/CdTe cylinders have been electrochemically synthesized within the pores of Anopore(tm) membranes. The alumina template suppresses the 'cauliflower' morphology that is typically observed in electrodeposited CdSe and CdTe films, although X-ray diffraction reveals the materials to be of poor crystallinity. The Anopore membrane template can be removed by treatment with aqueous 1M NaOH, resulting in an array of free-standing CdSe or CdSe/CdTe wires. Current-voltage data show that the Ni/CdSe array is rectifying, with a rectification ratio of 1000 at + or - 2 V. DTIC

STUDIES IN PREMIXED COMBUSTION

G. I. Sivashinsky 1993 15 p
(Contract DE-FG02-88ER-13822)
(DE93-007955; DOE/ER-13822/6) Avail: CASI HC A03/MF A01

During the period under review, significant progress was made in studying the intrinsic dynamics of premixed flames and the problems of flame-flow interaction. A weakly nonlinear model for Bunsen burner stabilized flames was proposed and employed for the simulation of three-dimensional polyhedral flames - one of the most graphic manifestations of thermal-diffusive instability in premixed combustion. A high-precision large-scale numerical simulation of Bunsen burner tip structure was conducted. The results obtained supported the earlier conjecture that the tip opening observed in low Lewis number systems is a purely optical effect not involving either flame extinction or leakage of unburned fuel. A one-dimensional model describing a reaction wave moving through a unidirectional periodic flow field is proposed and studied numerically. For long-wavelength fields the system exhibits a peculiar non-uniqueness of possible propagation regimes. The transition from one regime to another occurs in a manner of hysteresis. DOE

HYDROGEN AND SULFUR PRODUCTION FROM HYDROGEN SULFIDE WASTES

J. B. L. Harkness and R. D. Doctor 1993 8 p Presented at the Industrial Energy Technology Conference and Energy Manager's Workshop, Houston, TX, 24-25 Mar. 1993
(Contract W-31-109-eng-38)
(DE93-008658; ANL/ES/CP-78832; CONF-9303108-1) Avail: CASI HC A02/MF A01

A new hydrogen sulfide waste-treatment process that uses microwave plasma-chemical technology is currently under development in the Soviet Union and in the United States. Whereas the present waste treatment process only recovers sulfur at best, this process recovers both hydrogen and sulfur. The plasma process involves dissociating hydrogen sulfide in a 'nonequilibrium' plasma in a microwave or radio-frequency reactor. After the dissociation process, sulfur is condensed and sold just as is currently done. The remaining gases are purified and separated into streams containing the product hydrogen, the hydrogen sulfide to be recycled to the plasma reactor, and the process purge containing carbon dioxide and water. This process has particular implications for the petroleum refining industry, in which hydrogen is a widely used reagent and must be produced from increasingly scarce hydrocarbon resources. The modular nature of the new process may also offer economic advantages over small-scale waste treatment technologies widely used in the natural-gas industry. Laboratory-scale experiments with pure hydrogen sulfide indicate that conversions exceeding 90% are possible with appropriate reactor design and that the energy required to dissociate hydrogen sulfide is low enough for the plasma process to be economically competitive. In addition, the experiments show that typical refinery acid-gas streams are compatible with the plasma process and that all by-products can be treated with existing technology. DOE

MODIFICATION OF SPECTRAL DISTRIBUTIONS BY MULTILAYER STRUCTURES

P. J. Biltoft May 1992 14 p Presented at the European Conference on Energy Dispersive X Ray Spectrometry, Myconos, Greece, 30 May - 6 Jun. 1992
(Contract W-7405-eng-48)
(DE93-009308; UCRL-JC-109786; CONF-9205319-1) Avail: CASI HC A03/MF A01

Multilayer structures offer the unique ability to control the spectral distribution of x-rays at non-grazing incidence and to provide for the ability to focus x-rays. This combination of attributes offers some exciting possibilities for X-ray spectrometry. Double crystal monochrometers using multilayer structures have shown high energy selectivity with reasonable throughput. X ray optical systems using multilayers deposited onto figured substrates have been used to focus x-rays from a conventional tube to micron size spots. Future x-ray spectrometers will likely take advantage of the energy selection and focussing capabilities of multilayers as they become more readily available. Topics which will be covered in this paper include the following: the modification of spectral emissions from a conventional copper anode x-ray tube by a multilayer, multilayer fabrication, and characterization techniques as they apply to energy-dispersive x-ray spectroscopy (EDXRS). DOE

STUDIES OF HYDROGEN-AIR DIFFUSION FLAMES AND OF COMPRESSIBILITY EFFECTS RELATED TO HIGH-SPEED PROPULSION Ph.D. Thesis

Ganeshan Balakrishnan 1992 144 p
Avail. Univ. Microfilms Order No. DA9307178

The structure and the extinction phenomena of hydrogen-air diffusion flames in the counterflow configuration with full and reduced chemical-kinetic mechanisms are investigated. The main reduced mechanism considered is a two-step mechanism. Numerical calculations are performed for strain rates on the air side of 10(exp -4)/s to extinction. The effect of nitrogen chemistry and the uncertainties in elementary rate parameters on flame structure as well as on extinction is investigated. Based on the two-step scheme and on results from numerical integrations, an asymptotic analysis is then performed to derive analytical expressions for predicting extinction strain rates. The flame structure consists of three regions: a thin radical production zone in which H atoms are generated by the global step 3H2 + O2 yields 2H2O + 2H whose rate is largely determined by a high-activation-energy chain-branching elementary reaction, flanked by two thick radical-consumption layers in which the H is consumed by the overall step H + H + M yields H2 + M, the rate of which is controlled by different elementary reactions on the lean and rich sides. The predicted extinction conditions appear to be in reasonable agreement with experiments, although additional work is needed in specific areas that are indicated. Supersonic combustion in turbulent mixing layers locally involve counterflowing streams in which compressibility is important, with the viscous and chemical effects restricted to a narrow layer at the stagnation plane. A theoretical analysis of the inviscid flow is performed for small values of the ratio of the plate separation distance to the lateral extent of the plates, for both planar and axisymmetric geometries. The problem of computing the flow field is reduced to the solution of a single integral equation, which is achieved numerically. The flow exhibits choking at a critical value of the lateral extent of the plate, in the vicinity of which the Mach number approaches unity. The results provide the external boundary-layer conditions needed for studying the flame structure in the viscous region between the two counterflowing streams when compressibility is important. With pressure dependent mass addition along the porous walls, the choking condition is made relevant to the operation of solid-propellant rocket motors. Dissert. Abstr.

ANALYTICAL APPLICATIONS OF ELECTRIFIED INTERFACES BETWEEN TWO IMMISCIBLE SOLUTIONS

Petr Vanysek 7 Apr. 1993 26 p
(Contract N00014-91-J-1058)
(AD-A263085; TR-051) Avail: CASI HC A03/MF A01

Interfaces between two immiscible electrolyte solutions have some properties that can be investigated and utilized by methods of electrochemistry. This review compares electrochemistry on such interfaces with electrochemistry of metal electrodes immersed in solutions. It builds on knowledge of methods of electroanalysis and shows how it can be applied to the interfaces of immiscible liquids. A simple differential adapter that can convert any potentiostat to the 4-electrode potentiostate needed for the work is described. Experimental techniques involving potentiometry, polarography with dropping electrode, voltammetry and microinterfaces are outlined. DTIC

EFFECT OF ZINC AND IRON IONS ON THE ELECTROCHEMISTRY OF NICKEL OXIDE ELECTRODE: SLOW CYCLIC VOLTAMMETRY

Ivan Krejci and Petr Vanysek 7 Apr. 1993 25 p
(Contract N00014-91-J-1058)
(AD-A263098; TR-049) Avail: CASI HC A03/MF A01

Porous sintered nickel oxide electrodes were prepared by cathodic electroprecipitation from metal nitrate solutions and characterized by slow (0.1 mV/s) voltammetry in 6 mol/l KOH. The presence of iron or zinc ions resulted in decrease of electrode charging ability and similar changes in voltammograms were observed for both ions. Removal of iron or zinc ions and introduction of lithium ions partially restored the electrode and corresponding voltammogram to original conditions. Presence of cobalt in the electrode material diminished substantially the influence of zinc ions on the electrode properties. DTIC

MAGNETIC RESONANCE STUDIES OF PHOTO-INDUCED ELECTRON TRANSFER REACTIONS

H. vanWilligen Nov. 1992 13 p
(Contract DE-FG02-84ER-13242)
(DE93-012239; DOE/ER-13242/9) Avail: CASI HC A03/MF A01

Fourier Transform Electron Paramagnetic Resonance (FT EPR) is useful in the study of photochemical reactions: a microwave pulse rotates the electron spin magnetization vector from z (magnetic field) into xy plane (pi/2 pulse); the time evolution of magnetization in xy plane, the free induction decay (FID), is sampled. Fourier transform of FID gives the frequency domain EPR spectrum of the free radicals, and the method is ideal for time-resolved studies of free radicals produced by pulsed-laser excitation. Investigations of electron transfer reactions focused on porphyrin (donor) - quinone (acceptor) systems. First, two hydrogen abstraction reactions were studied with FT EPR: photoreduction of acetone with 2-propanol, yielding the acetone ketyl radical, and the reaction of 2-propanol with t-butoxy radicals. Then, the FT EPR study of benzoquinone or duroquinone anion radicals generated by pulsed-laser induced electron transfer from zinc tetraphenylporphyrin (ZnTPP) or tetrasulfonated Zn(TPP), was carried out in homogeneous solution, micellar solutions, and silica gel. Finally, FT EPR was used to study electron transfer quenching of triplet C(sub 60) by electron donors. DOE

ANALYSIS OF PROTOCOL GASES: AN ON-GOING QUALITY ASSURANCE AUDIT

Avis P. Hines Mar. 1993 10 p
(PB93-168839; EPA/600/A-93/055) Avail: CASI HC A02/MF A01

The Environmental Protection Agency (EPA) has initiated a national QA program on the suppliers of protocol gases. In the program, which will operate continuously, protocol gases are obtained and analyzed by EPA. The results of the EPA analysis are then compared to the Certificate of Analysis supplied with the protocol gas. Reported here is a comparison between the assay results obtained by EPA on protocol gases for SO2 and NO and the concentrations provided by the suppliers of the protocol gases. The results are being released on the Technology Transfer Network operated by the Office of Air Quality Planning and Standards of the EPA, Durham, N.C. NTIS

THERMAL PROPERTIES OF ORGANIC AND MODIFIED INORGANIC AEROGELS

R. W. Pekala and L. W. Hrubesh Aug. 1992 10 p Presented at the 1992 International Chlorofluorocarbon (CFC) and Halon Alternatives Conference, Washington, DC, 1 Oct. 1992
(Contract W-7405-eng-48)
(DE93-009230; UCRL-JC-111333; CONF-9210332-1) Avail: CASI HC A02/MF A01

Aerogels are open-cell foams that have already been shown to be among the best thermal insulating solid materials known. Improvements in the thermal insulating properties of aerogels are possible by synthesizing new organic varieties, by using additives within existing aerogel matrix, and by optimizing their nanostructures. We discuss these approaches and give some examples of aerogels which demonstrate the improvements. DOE

HIGH PRESSURE PREIGNITION CHEMISTRY OF HYDROCARBONS AND HYDROCARBON MIXTURES Final Report, 1 Jan. 1990 - 31 Dec. 1992

Nicholas P. Cernansky, David L. Miller, and David N. Koert 24 Feb. 1993 21 p
(Contract DAAL03-90-G-0024)
(AD-A263611; ARO-27417.6-EG) Avail: CASI HC A03/MF A01

A research program to study the oxidation and ignition characteristics of hydrocarbon fuels and their mixtures has been conducted at Drexel University. The research focused on three major tasks: examination of the chemistry of autoignition during compression ignition processes by performing parametric studies in a variety of experimental facilities listed below; development of chemical models which can simulate the experimental results; and the development of in situ measurement techniques. Several complementary bench scale experiments, which include a static reactor, an atmospheric pressure flow reactor, and a pressurized flow reactor, were used to examine the preignition chemistry and ignition behavior of progressively larger hydrocarbons over a range of temperatures, pressures, and equivalence ratios. Gas chromatography and Gc/Ms were used for chemical analysis of the stable reaction intermediates and products. Fourier Transform Infrared (FTIR) spectroscopy and degenerate four-wave mixing (DFWM) spectroscopy were used in efforts to develop in situ species measurement techniques. The overall program has been successfully completed and has added to our understanding of fuel factors and physical effects on the oxidation and ignition processes of hydrocarbon fuels.... SOME PROBLEMS IN THE MECHANICS OF SOLIDS WITH PHASE MIXTURES Final Report, 1 Jun. 1991 - 30 Nov. 1992

Roger L. Fosdick 19 Feb. 1993 9 p
(Contract DAAL03-91-G-0184)
(AD-A263652; ARO-28986.1-MA) Avail: CASI HC A02/MF A01

This project has concentrated almost entirely on non-convex minimization problems in nonlinear elasticity theory and the existence of deformation-induced microstructure under severe loading conditions. As the microstructure develops and becomes more dense with increasing loads, the material weakens and the body has a softer response. Our minimizing sequences predict this property. To complement our theoretical development, a large scale FEM code was implemented on the CM-200 machine. This code has a high refinement capability which allows us to study those regions of the body where the fine phase mixture occurs and the strain field becomes extremely irregular. DTIC

KINETICS OF NITRIC OXIDE FORMATION BEHIND 3 TO 4 KM/S SHOCK WAVES Final Report, 11 Jan. - 14 Dec. 1992
Charles E. Treanor and Marcia J. Williams 15 Feb. 1993 52 p
(Contract DAAL03-92-K-0003)
(AD-A263653; ARO-30404.1-EG-SDI) Avail: CASI HC A04/MF A01

A previously published group of O2/N2 shock-tube experiments, wherein the time history of the NO 5 micrometers radiation was measured, was studied to elicit information about the relevant chemical reactions which produce the radiation. It was found that the calculated radiation was sensitive to the rates used in the Zeldovich mechanism for NO formation, and that the rate measured by Monat et al. for N2 + 0 yields NO + N produced important features of the observed radiation. Vibration-dissociation coupling in this reaction modifies the radiation history in an important way, and is an essential element in obtaining agreement with the experiment. To improve agreement over a range of O2/N2 mixtures, it was necessary to take into account the faster vibrational relaxation of N2 by O2 and O collisions and the subsequent effect on vibration-dissociation coupling. MASS SPECTROMETRIC INVESTIGATION OF 2-METHOXYETHANOL AND 2-ETHOXYETHANOL CLUSTERS: MAGIC NUMBERS AND STRUCTURAL IMPLICATIONS
Gopal Vaidyanathan, William J. Herron, and James F. Garvey 3 Apr. 1993 48 p
(Contract N00014-88-K-0483)
(AD-A262822; TR-41) Avail: CASI HC A03/MF A01

We present the results of our mass spectrometric investigations for van der Waals clusters of 2-methoxyethanol and 2-ethoxyethanol. The cluster mass spectra were acquired for a variety of expansion conditions and electron energies. The protonated alkoxyethanol cluster ions (AE)nH(+) form the dominant cluster ion series. A number of fragment ions, that may arise from an unprotonated and/or a protonated alkoxyethanol molecular ion, were solvated by additional alkoxyethanol molecules. The (AE)n(H2O)mH(+) ions were observed with significant intensities only for n greater than or = 5 in neat as well as mixed alkoxyethanol/water expansions. It was also found that (AE)n(H2O)mH(+) cluster ions which satisfy the condition n = 2 (m + 2), for m = 1 and 2, have enhanced ion intensities. The various models that may explain the behavior of (AE)n(H20)mH(+) are discussed. DTIC

A process was developed to prepare 1,3-diamino- 5-pentafluoro sulfanylbenzene. This process involved two steps: preparing the dinitro compound, 1,3-dinitro- 5-pentafluoro sulfanylbenzene, and reducing this compound to form the corresponding diamine. This diamine was reacted with various dianhydrides, diacidchlorides, and epoxy resins to form polyimides, polyamides, and cross linked epoxies. These polymers were used to prepare semi-permeable membranes, wire coatings, and films.

AN INVESTIGATION OF RESOLUTION AS ENCOUNTERED IN VARIOUS CHROMATOGRAPHIC OPERATIONAL MODES Final Report, 1 Jan. 1991 - 30 Apr. 1992
Wayne A. Rubey Aug. 1992 75 p
(AF Proj. 3048)
(AD-A262883; UDR-TR-92-53; WL-TR-92-2053) Avail: CASI HC A04/MF A01

An investigation was performed relative to the generation of resolution in isothermal gas chromatography (ITGC), programmed-temperature gas chromatography (PFGC), and a newly evolving technique referred to as thermal gradient programmed gas chromatography (TGPGC). The generation of chromatographic resolution while using open tubular gas chromatographic columns was studied with respect to the influences of dispersion, selectivity, and solute partitioning. Experiments were subsequently conducted to simulate rapid whole column PTGC operation with lengthy open tubular columns. Close agreement between theory and actual generated resolution was obtained during this simulation activity. The major conclusion from this study was that a partition-ratio programming chromatographic operational mode, e.g., TGPGC, possesses considerable promise with respect to rapidly and effectively eluting solutes. Properly implemented TGPGC should be capable of operation whereby selectivity and partitioning are enacted in a near-optimum manner with respect to obtaining maximum useful resolution per unit time. This invention is related to producing oxygen from lunar or Martian materials, particularly from lunar ilmenite in situ. The process includes producing a slurry of the minerals and hot sulfuric acid, the acid and minerals reacting to form sulfates of the metal. Water is added to the slurry to dissolve the minerals into an aqueous solution, the first aqueous solution is separated from unreacted minerals from the slurry, and the aqueous solution is electrolyzed to produce the metal and oxygen.

RATES AND MECHANISMS OF REACTION OF HYDROGEN SULFIDE WITH IRON CHELATES Topical Report, Apr. 1993
D. W. DeBerry Apr. 1993 115 p Sponsored by Gas Research Inst. Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract GRI-5089-260-1875)
(PB93-184299; RCN-296-009-04-01; GRI-93/0019) Avail: CASI HC A06

Chelated iron liquid redox sulfur recovery processes hold promise for providing economical removal of hydrogen sulfide from natural gas with conversion to solid sulfur. They are complex chemical systems. An objective of this project is to identify and characterize the chemical interactions occurring in these liquid redox systems and determine which process parameters impact performance. This report presents the results of this project concerning the mechanism of oxidation of hydrogen sulfide by iron-based compounds in the liquid phase. The rates of reactions of chelated iron sorbing reagents with reduced sulfur species were measured over a wide range of conditions. The effects of relative reactant concentrations, pH, and ionic strength on these rates have been determined using a number of different methods. Effects of temperature and chelate type on the reaction of chelate iron with sulfide are also presented here. A kinetic model was developed to interpret these results and provide an overall framework for the reaction mechanism. This model has proven to be useful for integrating and explaining the results of the kinetics measurements. In addition, the model may become a useful tool for optimizing process chemistry and a key component of a general chemical process model. Details of the model and verification runs are given in this report. NTIS

DIFFRACTION AND HOLOGRAPHY WITH PHOTOELECTRONS AND AUGER ELECTRONS: SOME NEW DIRECTIONS
C. S. Fadley (California Univ., Davis.) Jun. 1992 66 p Presented at the 10th International Summer Institute in Surface Science (ISISS) Meeting, Milwaukee, WI, 29 Jun. - 2 Jul. 1992
(Contract DE-AC03-76SF-00098)
(DE93-007664; LBL-33306; CONF-9206332-2) Avail: CASI HC A04/MF A01

The current status of photoelectron and Auger-electron diffraction is reviewed, with emphasis on new directions of activity. The use of forward scattering in the study of adsorbed molecules, epitaxial overlayers, and clean surfaces is one of the most developed applications, and one that will become more powerful as higher energy resolution and perhaps spin analysis are used to resolve emitters on the basis of chemical state, position at a surface, or magnetic state. The use of larger data sets spanning a considerable fraction of the solid angle above a surface will also much enhance the structural information available, for example, in the growth of epitaxial layers or nanostructures on surfaces. Detailed fitting of experimental data to theoretical calculations based upon either single scattering or multiple scattering should also provide more rich structural information, including such parameters as substrate interlayer relaxation. Surface phase transitions in which near-surface layers become highly disordered can also be studied, with results that are complementary to those from such techniques as low energy electron diffraction and medium energy ion scattering. Short-range magnetic order also can be probed by somehow resolving the spin of the outgoing electrons, e.g. by using multiplet-split core levels. DOE

TABLES OF EXPERIMENTAL DATA USED FOR THE CORRELATION OF THE THERMOPHYSICAL PROPERTIES OF ETHANE
D. G. Friend, J. F. Ely, and H. Ingham Jan. 1993 306 p
(PB93-173417; NISTIR-3953) Avail: CASI HC A14/MF A03

The authors tabulate experimental data for the thermophysical properties of ethane from an extensive selection of the published literature. A complete tabulation of the data on ethane properties which were used in the development of correlating equations for the fluid state properties is provided. The tables give comparisons between the correlations and the data as well as the weight which was assigned to each point in the development of the correlations. The properties include pressure and densities of the saturated liquid and vapor, the PVT relationship in the single phase, isochoric and isobaric heat capacities, sound speed, viscosity, and thermal conductivity. The general range of the data is from the triple point, near 90.4 K and 1.1 MPa, to about 625 K with pressures to about 100 MPa. Author (revised)

THE ELECTROLYTE FACTOR IN O2 REDUCTION ELECTROCATALYSIS
E. Yeager, M. Razaq, D. Gervasio, A. Razaq, and D. Tryk 23 Apr. 1993 32 p
(Contract N00014-90-J-1212)
(AD-A263565; TR-92-ONR) Avail: CASI HC A03/MF A01

The performance of acid fuel cells operating at moderate temperatures (less than or = 250 C) is limited by the irreversibility of the O2 cathode. Much effort has been directed to identifying more active catalysts than highly dispersed platinum which sets the present bench mark. The optimization of the choice of electrolytes, however, also provides a way to speed up the kinetics. This paper lists, various ways in which the electrolyte can influence the kinetics of the O2 reduction and discusses a few in more detail. The conclusion is reached that the adsorption of electrolyte components has a pronounced effect but that the kinetics do not have a strong dependence on pH or O2 solubility when mass transport control is not involved. Experimental results for a few new acid electrolytes and proton exchange membranes are presented. DTIC

THE GLOBAL POTENTIAL ENERGY SURFACES OF THE LOWEST TWO 1A-PRIME STATES OF THE OZONE MOLECULE: THEORETICAL DETERMINATION AND ANALYSIS Ph.D. Thesis
G. J. Atchity Jan. 1993 264 p
(Contract W-7405-eng-82)
(DE93-007537; IS-T-1217) Avail: CASI HC A12/MF A03

The two lowest 1A' potential energy surfaces of the ozone molecule are determined and analyzed using accurate ab-initio MCSCF calculations. The shape-scale perimetric coordinates for triatomic molecules are discussed and further developed. Because the previously determined intersection between these two surfaces of like symmetry is unusual, much of the present work involves this intersection. The relevant theory of intersections is reviewed, and a method for characterizing intersections according to the topology of the surfaces in their vicinity is developed. The reasons for this particular crossing in ozone are investigated. The intersection point in C(sub 2v) symmetry is part of a larger, 1-dimensional intersection seam in C(sub s) symmetry. This seam is shown to consist of four branches. A new method for determining an intersection point in a two-dimensional coordinate space, based on the wavefunction phase-change theorem of Herzberg-Longuet-Higgins, is also developed. Finally, global mappings of the two potential energy surfaces in the scale-shape perimetric coordinates are determined. The minima of the two surfaces, their dissociation and rearrangement paths, and the map of the energy difference between them are all discussed. It is shown that direct formation of the ring structure of ozone from O2 and O is improbable, and that there is no rearrangement pathway on the ground state representing the interchange of two atoms. KINETICS AND DYNAMICS OF REACTING SYSTEMS Final Report, 1 Jan. 1989 - 31 Dec. 1992
Sidney Redner 22 Mar. 1993 12 p
(Contract DAAL03-89-K-0025)
(AD-A264046; ARO-26256.21-CH) Avail: CASI HC A03/MF A01

This project was devoted to a study of the kinetics of diffusion-controlled and surface catalytic reactions. For catalytic reactions, the kinetics of the saturation process were elucidated. The role of interactions between adsorbates on the surface reaction was examined. For the diffusion-controlled reaction, a comprehensive theoretical framework to describe the spatial organization of reactants was developed. Particular attention was devoted to understanding the reaction dynamics at an interface which separates two reactive species. Geometrical features of this interface and the time dependence of the reaction rate were determined. DTIC

IN-SITU TEMPERATURE AND CONCENTRATION MEASUREMENTS OF ORGANOSILICON DECOMPOSITION IN A CHEMICAL VAPOR DEPOSITION REACTOR Ph.D. Thesis - Paris XI Univ., 1989 [MESURES IN-SITU DE TEMPERATURES ET CONCENTRATIONS SUR LE SYSTEME SI-C-H DANS UN REACTEUR DE DEPOT CHIMIQUE EN PHASE VAPEUR]
Nathalie Herlin 1990 124 p In FRENCH Original contains color illustrations
(ONERA-P-1990-3; ETN-93-93720) Avail: CASI HC A06/MF A02

In situ CARS (Coherent Anti-Stokes Raman Scattering) temperature and concentration measurements in a cold wall LPCVD (Low Pressure Chemical Vapor Deposition) vertical reactor are reported. Silicon Carbide (SiC) is deposited from a pure low velocity Tetramethylsilane (TMS) flow. Temperature and concentration maps were measured in the gas phase near a graphite substrate heated by the Joule effect. In situ concentration measurements were made on TMS and hydrogen which is the main product of TMS thermal decomposition. Ex situ partial pressure measurements were made and a temperature discontinuity was observed between the hit surface and the nearby gas in the TMS flow where thermal exchanges and chemical reactions take place simultaneously. This disconinuity is larger in the case of a pure hydrogen flow. These measurements prove incomplete energy transfer between the rotation of molecular species and a hit surface. This is explained using an accommodation coefficient which ranges from 0.05 for hydrogen on SiC to 0.15 for hydrogen on graphite. Thermal exchanges were also studied in the case of hydrogen or nitrogen on tungsten. This last case exhibits a nonBoltzmann rotational distribution when the distance from the hot wall is of the same order of magnitude as the mean free path. An explanation is proposed for this effect. SCANNING IONIC MICROSCOPY WITH HIGH SPATIAL RESOLUTION: PARALLEL ACQUISITION OF ELEMENTARY IMAGES BY HIGH RESOLUTION MASS SPECTROMETRY Ph.D. Thesis - Paris-Sud Univ., 1989 [MICROSCOPIE IONIQUE A BALAYAGE A HAUTE RESOLUTION SPATIALE: OBTENTION SIMULTANEE D'IMAGES FILTREES PAR UN SPECTROMETRE DE MASSES A FORT POUVOIR SEPARATEUR]

Fabrice Boust Sep. 1990 244 p In FRENCH Original contains color illustrations

(ONERA-NT-1990-7; ETN-93-93726) Avail: CASI HC A11/MF A03

The instrumentation allowing secondary ionic emission processing for the purpose of elementary and isotropic analysis is described. The device enables most of the analytical information contained in the tiny volume of matter sputtered during the impact of a finely focused primary ion beam to be retained. The instrument is built about a central column incorporating an electron microscope and the electrostatic optical system of the ion probe. The lower lens acts both as last demagnifying system and as secondary ion collecting device. Both primary positive ions (cesium) and secondary negative ions run along the same axis. The mass spectrometer, including a spherical electrostatic sector and a magnetic prism, is arranged as in a Mattauch-Herzog configuration, hence allowing simultaneous detection of different ionic species. Very small ion detectors are needed to succeed in parallel detection. Consequently, focus is on developing miniature detectors including conversion dynode followed by a scintillator and a photomultiplier. However, the performance not being satisfactory, small electron multipliers were used. The contribution of parallel acquisition is emphasized through a number of secondary ion images with a 100 nm lateral resolution. ESA

HIGH MASS RESOLUTION GLOW DISCHARGE MASS SPECTROMETRY USING AN EXTERNAL ION SOURCE FT-ICR MASS SPECTROMETER Technical Report No. 43

C. H. Watson, J. Wronka, F. H. Laukien, C. M. Barshick, and J. R. Eyler 5 Mar. 1993 18 p Prepared in cooperation with Bruker Instruments, Inc., Billerica, MA

(Contract N00014-87-J-1248)

(AD-A264347) Avail: CASI HC A03/MF A01

A glow discharge source has been adapted for use with a commercial external ion source Fourier transform ion cyclotron resonance mass spectrometer. This combination shows promising analytical usefulness. Results on National Institute of Standards and Technology stainless steel standards showed that peaks due to nominally isobaric atomic isotopes can be observed with high mass resolution (m/delta m(sub 1/2) greater than or equal to 290,000). Detection limits in the high parts per billion to low parts per million range were achieved for analysis of trace metals in the standards, and concentrations of the trace elements were determined with good accuracy (better than 15%). A NOVEL PROCESS FOR METHANOL SYNTHESIS

J. W. Tierney and I. Wender 12 Feb. 1993 14 p

(Contract DE-FG22-89PC-89786)

(DE93-013070; DOE/PC-89786/T15) Avail: CASI HC A03/MF A01

A bench-scale reactor is being used to conduct studies of the conversion of synthesis gas to methanol (MeOH) in the liquid phase by a novel process. In previous reports, we provided evidence for a two step reaction in series, the carbonylation reaction mainly taking place close and the hydrogenolysis reaction taking place on the surface of the copper chromate. The interaction between the two catalyst enhances the rate of MeOH formation. In the last quarter, we showed that under present operating conditions, the methyl formate (MeOH) concentration is not in equilibrium and hence both the carboxylation and the hydrogenolysis reactions influence the rate of MEOH formation. The activities of other alkali and alkaline earth compounds as catalysts, the effect of water and the controlling reaction in the concurrent synthesis is described in this report. DOE

CONTRIBUTION TO THE STUDY OF THE INTERACTION BETWEEN ACOUSTIC WAVES AND COHERENT STRUCTURES INDUCED BY A PRISMATIC CYLINDER IN A RECTANGULAR CAVITY Ph.D. Thesis - Paris VI Univ. [CONTRIBUTION A L'ETUDE DE L'INTERACTION ENTRE DES ONDES ACOUSTIQUES ET DES STRUCTURES TOURBILLONNAIRES EMISES PAR UN OBSTACLE PRIMASTIQUE DANS UNE CAVIT RECTANGULAIRE]

Francois Garnier Sep. 1990 159 p In FRENCH
(ONERA-NT-1990-10; ETN-93-93728) Avail: CASI HC A08/MF A02

Due to the complexity of the problem of the association of large scale vortices to combustion instabilities, the interaction of coherent structures and acoustics are considered in the simplified case of a nonreactive flow. Experimental works were developed on an aerodynamic experiment and in the energetics department. Strouhal number values, associated to coherent structure emission, are similar for the two experiments. A resonance mechanism is observed, and flow visualizations show that vortices are quite symmetric when vortex shedding frequency and that of an acoustic mode are closed. An analytical modeling is developed from the Lighthill theory. Coupling between different modes, observed in experiments, is qualitatively confirmed. The numerical simulation of the interaction between acoustics and coherent structures is made with the help of KIVA code. In the initial version, this code does not describe inflow and outflow. Tests for these boundary conditions have been made with success. This allows a simulation of the aerodynamic experiment. The Strouhal number values, associated to vortex shedding, are in good agreement with the experiments. The transition between a various wake and a vortex street is made easy by an acoustic excitation. The results obtained must give, at term, an efficient action on combustion instabilities. ESA

Given the widespread use of ammonium nitrate (AN) and ammonium perchlorate (AP) for energetic materials applications, relatively little data is available regarding their behavior under shock loading. We have evaluated the shock Hugoniots of AN and AP at high initial density (greater than or = 94% TMD) to pressures of approximately 20 GPa. We have used sound speed measurements, isothermal compression x-ray diffraction experiments and shock loading experiments to further explore the behavior of the two materials at elevated pressures. (AD-A264307; CRDEC-TR-420) Avail: CASI HC A03/MF A01

The physical and chemical properties of various molecules, calculated by three different semi-empirical methods (MNDO, AM1, and PM3) are compared to experimental values using rigorous statistical analysis. The results show that the best method for calculating physical/chemical properties depends on the property and that no one method is adequate to calculate all the physical properties. Furthermore, by employing appropriate statistical tools, the precision and accuracy that each method calculates the different physical/chemical properties was determined. This will make it possible to use computational chemistry as a predictive tool with much better confidence. DTIC

A complete understanding of the complex network of chemical reactions occurring in flame environment requires the determination of spatially resolved species concentration and temperature profiles which, in turn, can be used as stringent tests for present and developing flame models. Temperature profiles have traditionally been measured using fine wire thermocouples, which can provide a high degree of spatial resolution in a flame given that thermocouple diameters are on the order of ten to hundreds of microns. The thermocouple, however, constitutes a physical interface which may alter the local flame environment. To minimize purtubations to the flame, thermocouples are made as small in diameter as possible and are often coated to reduce or eliminate surface catalytic effects. Another advantage of keeping the diameter of thermocouple as small as possible is that corrections made to the measured temperature for radiation losses and heat conduction are minimal. DTIC

DIRECT MONTE CARLO SIMULATION OF THE CHEMICAL EQUILIBRIUM COMPOSITION OF DETONATION PRODUCTS
M. S. Shaw 1992 5 p Presented at the 10th Detonation Symposium, Boston, MA, 12-16 Jul. 1993
(Contract W-7405-eng-36)
(DE92-040372; LA-UR-92-2793; CONF-930713-3) Avail: CASI HC A01/MF A01

The equation of state of detonation products is a crucial part of any calculation of reacting explosives and their effects. A new Monte Carlo simulation method was developed which allows for chemical equilibration as a natural part of a single simulation; this method is designated N(sub atoms)PT ensemble Monte Carlo since the number of atoms is held constant. The partition function for the collection of atoms is rewritten as a sum over all molecular partition functions. The new method is applied to a variety of test cases relevant to detonation products, such as N(sub 2) + O(sub 2) in equilibrium 2NO at 30 GPa and 3000 K. Work is in progress on combining the N(sub atoms)PT ensemble with the Gibbs ensemble for simulating a fluid-fluid phase segregation. DOE

SURFACE CHEMISTRY OF HYDROGEN-PASSIVATED POROUS SILICON-OXIDATION OF SURFACE SI-H GROUPS BY ACETONE
Ling-Fen Rao and John T. Yates, Jr. 12 Apr. 1993 21 p
(Contract N00014-82-0280)
(AD-A264655) Avail: CASI HC A03/MF A01

The oxidation of hydrogen-passivated porous silicon by acetone at room temperature has been observed by using transmission infrared spectroscopy. After reaction with liquid acetone, two infrared absorption modes at 2253 cm(-1) and 2200 cm(-1) develop, and this is accompanied by loss of absorbance of the Si-H stretch modes at 2142, 2110 and 2089 cm(-1). We postulate that oxidation of the surface silicon hydride species by acetone to form (CH3)2HCO-Si-H(x) and ((CH3)2HCO)2Si-H(x) species has occurred. This surface reaction may be utilized for passivation of the silicon surface. DTIC

The 32nd annual Sanibel Symposium was held March 14 to 21, 1992. The format of the symposium adopted for the past 2 years was followed again this year providing a compact 8-day schedule with an integrated program of quantum biology, quantum chemistry, and condensed matter physics. The topics of the sessions covered by these proceedings include Thirty-five Years of Progress in Electronic Structure Theory, Density Matrices and Other Revelations of 1955, Non-Born-Oppenheimer Methods, Atomic and Molecular Phenomena in Astrophysics, Photoinduced Phenomena, Reactive Molecular Collisions, Quantum Monte Carlo, Density-Functional Theory, Thin Films and Surfaces. A special session on Theoretical Inorganic Chemistry was held in memory of Arnold Karo, one of the real old-timers at Sanibel. All the articles have been subjected to the ordinary refereeing procedures of The International Journal of Quantum Chemistry. The articles presented in the sessions on quantum biology and associated poster sessions are published in a separate volume of The International Journal of Quantum Chemistry. DTIC

STUDIES IN LEWIS ACID AND SUPERACID IONIC LIQUIDS Final Report, 1 Dec. 1989 - 30 Jun. 1992
Robert A. Osteryoung 16 Apr. 1993 33 p
(Grant AF-AFOSR-0099-90)
(AD-A264683; AFOSR-93-0338TR) Avail: CASI HC A03/MF A01

Studies in an ambient temperature chloroaluminate molten salt composed of aluminum chloride and 1-ethyl-3-methylimidazolium chloride were performed. A variety of topics were investigated. The behavior of electroactive polymers, mainly polyaniline, was investigated, and simultaneous EPR and electrochemical experiments were performed. The stoichiometry of several inorganic complexes ions was investigated in a near neutral melt, and a procedure to buffer the neutral melts was examined. A number of electrochemical studies with emphasis on the use of fast pulse voltammetry at very small microelectrodes were performed. Finally, the chemistry and electrochemistry of solutes as influenced by the presence of a proton (Bronsted) acid were investigated by means of electrochemical and NMR techniques. Gutmann donor/acceptor numbers of the melts were obtained, and the behavior of dimethylaniline in the presence and absence of a Bronsted acid was examined. The presence of both Lewis and Bronsted adducts was confirmed. DTIC

SURFACE CHEMISTRY OF N2H4 ON Si(100)-2X1 Technical Report No. 18
Y. Bu and M. C. Lin 24 May 1993 25 p
(Contract N00014-89-J-1235)
(AD-A264819) Avail: CASI HC A03/MF A01

The adsorption and thermal decomposition of N2H4 on Si(100)-2x1 were investigated using XPS, UPS, HREELS, and LEED. Upon adsorption of 0.2 L N2H4 on the surface at 100 K, partial dissociation of the NH bonds was indicated by the appearance of the Si-H stretching mode at 255 meV in HREELS and the 399.0 eV peak in N(sub 1S) XPS, which is assigned to the N2H(x) (presumably N2H3) species. At lower dosages (D is less than 0.4 L), N2H4 adsorbed on Si(100)-2x1 in a side-on rather than an end-on geometry and hydrogen-bonding is likely to be formed in the overlayer adsorbates. The NN bond breaking process was observed to occur at 600 K; the NH(x) products (x = 0,1,2) could be identified on the surface. At this temperature, the NN stretching mode essentially disappeared and the NH2 deformation and the NH stretching modes shifted from 200 and 413 to 192 and 420 meV, respectively. The same conclusion could also be established from the corresponding XPS and UPS results. Annealing the surface to higher temperatures caused further NH bond breaking, accompanied by the desorption of H2, while N remained on the surface forming Si nitride. DTIC

STUDIES OF CURVATURE, STRAIN, AND UNSTEADY EFFECTS ON PREMIXED FLAMES Ph.D. Thesis
Tarek Echekki 1993 250 p
Avail: Univ. Microfilms Order No. DA9309590

The effects of curvature, strain, and unsteadiness on premixed flames are studied analytically, numerically, and experimentally. The approach includes the development of simplified problem formulations and the study of flames in which the various effects may be isolated. The steady and unsteady (periodic and transient) response to strain are investigated using the one-dimensional strained flame. A simplified reaction rate model is proposed to eliminate the non-linearity associated with Arrhenius models. Solutions using this model agree very well with numerical results based on the Arrhenius model. The analytical treatment, however is much simpler. The effect of flame curvature on stationary cylindrical flames (sink and source configurations) are studied analytically using the simplified reaction rate model. Analytical solutions show that source and sink effects on the flame propagation rates are negligible except when the flame is near the source or sink despite the strong dependence of the preheat zone structure on flame curvature. Consequently, the flame may be considered locally planar. A differential quasi-one dimensional flame model which accounts for flame curvature, lateral flow expansion, and cross-stream diffusion is formulated. It is used to identify the mechanisms that enhance the displacement speed which denotes the velocity of the unburnt gas relative to the flame. Computations of a quasi-one dimensional flame show that the contribution of cross-stream diffusion to displacement speed enhancement may be significant. The results also show that, for a neutrally diffusive mixture, there is a surface in the flame where the mass flux is invariant to lateral flow expansion. The effect of curvature and stretch on the displacement speed are studied experimentally and numerically using the flame tip of a slot burner. The study is limited to a diffusionally neutral mixture to isolate hydrodynamic effects; this is verified by temperature measurements using Rayleigh scattering. The results show that the displacement speed correlates linearly with stretch. The same correlations give a nonlinear dependence on curvature which suggests the existence of a minimum radius of curvature associated with limitations on diffusional transport in highly curved flames. Dissert. Abstr.

MAGNETIC CHARACTER INVESTIGATION OF HIGHER ALCOHOL SYNTHESIS Cu-Co-Cr CATALYSTS
U. A. Donatto, T. L. Hoard, and A. N. Murty 1992 10 p Presented at the National Science Foundation (NSF) Conference on Diversity in the Scientific and Technological Work Force, Washington, DC, 24-27 Sep. 1992
(Contract DE-FG22-89PC-89762)
(DE93-009732; CONF-9209330-1) Avail: CASI HC A02/MF A01

The selectivity and conversion efficiency of the catalyst are reported to be governed by intermetallic ratios of the three elements. High yields of methanol in a copper-rich field, hydrocarbons in a cobalt-rich field, and mixed alcohols in the intermediate range were observed. The basic mechanism, the extent and effect of intermetallic interactions, or the role and function of chromium still remain unclear. To examine the correspondence between the catalytic and magnetic % behavior of the catalyst, we have investigated the Zero-field Nuclear Magnetic Resonance spectra and Hysteresis character of a series of Cu/Co/Cr trimetallics with Cu/Co ratio varying from 0.2 to 8.0. The magnetic moment of the catalyst system is very low for Cu/Co less than 1.5, dramatically increases when 1.5 less than Cu/Co less than 5.0 and drops for Cu/Co is gre ater than 5.0. The NMR results indicate that chromium serves as a support and inhibits any strong intermetallic interaction between copper and cobalt. DOE

Decomposition of H2S with a catalytic membrane reactor was demonstrated in the lab with a ceramic membrane. An existing ceramic membrane with 40 A pore size was modified with silica oxide to have a selectivity of hydrogen over nitrogen of approximately 28. Decomposition was nearly double the thermodynamic equilibrium ratio (12 vs. 6.8%) at 800 C with the modified membrane. Simulation study indicates up to 40% higher than equilibrium conversion could be achieved with the membrane at a higher temperature. Further, an improved membrane with a nearly infinite hydrogen selectivity was developed with a similar modification method. A membrane like this will provide an additional enhancement in the conversion of H2S, which will be experimentally verified in the future. Another process, coupling decomposition with oxidation, was investigated with a straight tube to demonstrate the concept. Generation of SO2 was neligible. An additional 20-30% of enhancement by the concept is expected and will be experimentally verified with the modified membrane. Conceptual design on the membrane reactor utilizing existing engineering and material technology was completed for future field demonstration. NTIS

The objective of the work is to provide accurate data on diffusion coefficients and heats of absorption of acid gases in aqueous amine solutions to assist in the design of economical amine treating systems and to improve the efficiency of existing plants. Specifically covered in the report are measurements of the mutual diffusion coefficient of methyldiethanolamine (MDEA) and diethanolamine in water. Measurements have been made at 25, 50, and 75 C and at 0, 20, 35, and 50 wt.% amine. Heats of absorption of CO2 into aqueous mixtures of MDEA have also been measured calorimetrically. Results are reported at temperatures of 120 and 260 F and pressures of 500 and 1000 psia at total MDEA concentrations of 20, 35, and 50%. NTIS

(Contract N00014-90-J-1212)
(AD-A263564; TR-91-ONR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Dioxygen reduction has been examined in several new acid electrolytes and mixtures of these electrolytes with concentrated phosphoric acid (used in present acid H2-O2 fuel cells). The polarization curves have been determined on smooth platinum with the rotating disk and ring-disk electrodes and on high-area platinum with gas-fed electrodes of the semi-hydrophobic-type. The polarization is less than with concentrated H3PO4 in some of these alternative electrolytes. Possible explanations are discussed. DTIC

DETAILED STUDIES OF SOOT FORMATION IN LAMINAR DIFFUSION FLAMES FOR APPLICATION TO MODELING STUDIES Annual Report, 1 Feb. 1992 - 31 Jan. 1993
Robert J. Santoro 1 Mar. 1993 52 p
(Grant AF-AFOSR-0285-90)
(AD-A264827; AFOSR-93-0285TR) Avail: CASI HC A04/MF A01

A study of soot particle formation in laminar diffusion flames has been undertaken to investigate soot precursor chemistry, particle inception, and surface growth phenomena. During the first year of this study, emphasis has been given to species concentrations measurements made using mass spectrometric techniques. These measurements have demonstrated that species measurements can be obtained in particle laden regions of diffusion flames using a novel sampling probe approach. In particular, measurements have been obtained of acetylene, diacetylene, benzene, and stable combustion products throughout methane/air and ethene/air laminar diffusion flames. By combining these measurements with previous soot particle and velocity field measurements, it has been possible to follow the soot growth process along individual particle paths. These results establish that soot particle growth ceases due to the depletion of growth species not through the loss of soot particle reactivity as observed in premixed flame studies. Similarly, laser-induced fluorescence measurements of polynuclear aromatic hydrocarbons have been undertaken to follow the evolution of the soot precursor field. These measurements have established that laser-induced fluorescence can be used to reveal the qualitative structure of the molecular growth process leading to soot particle formation. These results need to be extended to provide more quantitative comparisons, particularly regarding fuel structure effect. Additional studies have been carried out to characterize the effects of aggregates on the interpretation of light scattering measurements. The results of these studies have shown that through the incorporation of fractal analysis, a self-consistent treatment of aggregates can be incorporated into the light scattering analysis. DTIC

The results of a three task NO(x) program are provided. The three tasks covered are as follows: (1) thermal NO production; (2) NO2 formation and removal in flame fronts; and (3) NO removal by natural gas reburning. Detailed descriptions of the species and temperature diagnostics as well as combustion models used in the study are given. Measurements on a low pressure, oxygen-enriched, methane/air flame are described. The rate of the reaction of O + N2 yields NO + N is given for the temperature range from 2185-2413 K. Measurements on low pressure methane flames seeded with NO simulating conditions in natural gas reburning are also described. Results of CH, CN, 1CH2, NH2, NCO, NH, and HNO measurements are compared with modeling results. Moreover, a design study for an atmospheric pressure experiment is described. NTIS

The HYSULF process decomposes hydrogen sulfide using mild conditions. In the process, hydrogen sulfide is first reacted with a quinone in an organic solvent to produce sulfur and hydroquinone. After sulfur removal, hydroquinone is catalytically processed to recover hydrogen and recycle quinone-solvent. The produced sulfur is of excellent quality and easily recoverable from the solvent. The organic solvent should eliminate corrosion problems associated with commercial aqueous redox systems which produce only sulfur. Since no air oxidation is used, the sulfite-sulfate salt problems of aqueous systems will be avoided. The purpose of the GRI contract was to develop a better mechanistic understanding of process chemical reactions and economics. This was to result in the following: (1) Increased quinone conversion and sulfur precipitation rates; (2) Determining the effect of carbon dioxide on first stage chemistry; and (3) Eliminating the anthrone by-product produced in the dehydrogenation step. Essentially, all of the objectives of the project were completed. NTIS

METHODS FOR PREPARATION OF MIXTURES OF GASES IN AIR AT THE PARTS-PER-BILLION TO PARTS-PER-MILLION CONCENTRATION RANGE FOR CALIBRATION OF MONITORS
Z. Karpas, S. Melloul, Y. Pollevoy, and A. Matmor May 1992 18 p In HEBREW
(DE92-642433; NRCN(TN)-131) Avail: CASI HC A03/MF A01 (US Sales Only)

Static and dynamic methods for generating mixture of gases and vapors in air at the parts-per-billion (ppb) to parts-per-million (ppm) concentration range were surveyed. The dynamic methods include: a dynamic flow and mixing system; injection of samples into large volumes of air; exponential dilution; permeation and diffusion tubes; and generation of the target gas by chemical reaction or electrolysis. The static methods include preparation of mixtures by weighing the components, by volumetric mixing, and by partial pressure method. The principles governing the utilization of these methods for the appropriate applications were discussed, and examples in which they were used to calibrate an ion mobility spectrometer (IMS) were given. THE TEMPERATURE DEPENDENCE OF THE DEFORMATION AND OXIDATION BEHAVIOR OF AN AGE-HARDENABLE BETA + ALPHA-TWO TITANIUM ALLOY Technical Report
D. M. Goto, L. S. Quattrocchi, and D. A. Koss 5 Mar. 1993 16 p
(Contract N00014-91-J-1414)
(AD-A262232; TR-5) Avail: CASI HC A03/MF A01

The beta Ti alloy Ti-23Nb-11Al (at %) is unique in that it is age hardenable due to the formation of lath-like alpha 2-phase precipitates based on Ti3Al. Furthermore age-hardening occurs at temperatures significantly higher than most conventional beta Ti alloys. This suggests the possibility of the elevated temperature usage of alpha 2-strengthened beta Ti alloys such as Ti-23Nb-11Al. The study examines the compressive deformation behavior of the Ti-23Nb-11Al alloy in the -196 deg. C to 650 deg. C temperature range and demonstrates that very high strengths are possible even at 600 deg. C by precipitation hardening due to the alpha 2 phase. The thermogravimetric oxidation behavior in laboratory air from 600 deg to 700 deg. C indicates parabolic behavior consistent with oxygen diffusion through a scale. DTIC

(DE93-753130; JAERI-M-92-066) Avail: CASI HC A04/MF A01

Corrosion of structural materials with molten metal is one of the major concerns of the feasibility of this concept. Many experimental works have been performed to examine the reactivity of eutectic Li17Pb83 with stainless-steel, and proved that the reactivity of it with structure materials is lower than that of the other molten breeders such as Li and LiF-BeF2. Several investigators have reported that weldments of Cr-Mo ferritic steel degradate with liquid LiPb because of the liquid metal induced embrittlement (LMIE) phenomena. Present study was aimed at the susceptibility of LMIE in the LiPb-steel system under various stress conditions. Tests were done with Li17Pb83 and pure Pb at 500 C. Test specimens of U-bend, tensiled-rod and weldments were prepared from austenitic (SUS316) and ferritic (modified 9Cr-1Mo) steels. At a high stress condition of 70% of the break stress, generation of microcracks was observed. DOE

FUNDAMENTAL ASPECTS IN THE DESIGN OF PASSIVE ALLOYS
D. D. Macdonald and M. Urquidi-Macdonald 1993 15 p Presented at the European Symposium on Passive Films, Paris, France, 15-19 Feb. 1993
(Contract DE-FG02-91ER-45461)
(DE93-009028; DOE/ER-45461/3; CONF-930271-1) Avail: CASI HC A03/MF A01

Alloying is the most extensively used method for enhancing the passivity of base metals. The art of alloying extends back into antiquity, but it was not until the early part of this century that the highly passive stainless steels were developed. More recently, in response to the need for high strength, corrosion-resistant alloys for gas turbines, various superalloys have been devised that exhibit great resistances to dry oxidation. The role(s) of alloying elements in enhancing passivity in aqueous environments, in terms of the point defect model (PDM) and the solute-vacancy interaction model (SVIM) that was developed a number of years ago is discussed. DEFORMATION MECHANISMS IN Be(SUB 12)X COMPOUNDS
S. M. Bruemmer, J. L. Brimhall, L. A. Charlot, S. Sondhi, R. G. Hoagland, and J. P. Hirth (Washington State Univ., Pullman.) Dec. 1992 8 p Presented at the High-temperature Ordered Intermetallic Alloys V, Boston, MA, 30 Nov. - 3 Dec. 1992
(Contract DE-AC06-76RL-01830)
(DE93-009080; PNL-SA-21288; CONF-9211205-1) Avail: CASI HC A02/MF A01

Dislocation structures were examined, and active slip systems identified, in Be12Nb after compressive deformation at 20, 800, 900, 1000, and 1200 C. A large number of slip systems are active at 1200 C, but these decrease significantly at temperatures below 1000 C. Dislocation structures at low temperatures are limited to 1/2 is less than 101(101) partial dislocations either paired or creating isolated planar faults. Significant ductility is not observed until 1200 C when a second type of partial dislocation, 1/2 is less than 100(011) is present. Dislocations observed in the body-centered tetragonal Be12X compounds (where X can be Nb, Ta, Mo, V, Fe etc.) were modelled atomistically using molecular dynamics. Simulations corroborate the stability of these dislocation systems and indicate that the stacking faults associated with these partial dislocations have very low fault energy. DOE

(DE93-007913; CONF-930502-3) Avail: CASI HC A03/MF A01

Results show that SiC materials sintered with additions of Y and Al compounds can achieve the high level of mechanical properties required for use in heat engines. However, the reaction of the second phase with SiC resulting in strength limiting pools, result in increased variability in materials properties. If this variability can be controlled, the relatively low cost of raw materials and processing for Hexoloy SX manufacture would make these materials attractive for low and high temperature engine applications. A unique process for texturing InP (100) wafers by anisotropic etching was developed. The process produces irregular V-grooves on the surface, which reduce the surface reflectivity. The process does not require photolithography or masking. The etching characteristics depend on doping, with etching tending to proceed more rapidly on the more heavily doped samples. Reduced reflectivity surfaces formed using this process can be applied to solar cells, photodetectors, and other optoelectronic devices. Author

TRANSFORMATION TOUGHENING
M. J. Rafa 19 Apr. 1993 14 p
(Contract DE-FG02-87ER-45318)
(DE93-011805; DOE/ER-45318/6) Avail: CASI HC A03/MF A01

In NiAl, we have succeeded in determining the complete Ginzburg-Landau strain free energy function necessary to model the cubic to tetragonal martensite transformation in a sample of any size. We believe that this is the first time that the parameters of a Ginzburg-Landau functional and the complete strain spinodal for any three-dimensional displacive transformation were used in simulating the transformation near a crack tip under Mode 1 loading; the transformation pattern and toughening are different from standard transformation toughening theories. Furthermore, the strain spinodal has an approximately conical shape which can be specified by two material dependent experimentally accessible parameters, rather than the ellipsoidal shape in standard theories. Stress induced martensitic transformation in a polycrystalline sample of NiAl was simulated. In the ZrO2 system, first principles calculations to determine the semi-empirical potentials for simulating the cubic-tetragonal and tetragonal-monoclinic transformations were started by doing a more elaborate total energy calculation. In the Al2O3 system, we discovered that the first principles calculations and semi-empirical potentials were completed by another group in England. It is these measurements on which we will base our molecular dynamics simulations. DOE

A ONE-DIMENSIONAL CONTINUUM MODEL FOR SHAPE-MEMORY ALLOYS
Rohan Abeyaratne, San-Joo Kim, and James K. Knowles Jan. 1993 40 p Prepared in cooperation with Massachusetts Institute of Technology, Cambridge, MA
(Contract N00014-90-J-1871)
(AD-A262505; TR-11) Avail: CASI HC A03/MF A01

An explicit constitutive model that is capable of describing the thermomechanical response of a shape-memory alloy is constructed. The model consists of a Helmholtz free-energy function, a kinetic relation, and a nucleation criterion. The free-energy is associated with a three-well potential energy function; the kinetic relation is based on thermal activation theory; nucleation is assumed to occur at a critical value of the appropriate energy barrier. The predictions of the model in various quasi-static thermomechanical loadings are examined and compared with experimental observations. DTIC

ENVIRONMENTAL EMBRITTLEMENT OF BINARY AND Zr-DOPED Ni3Al
E. P. George, C. T. Liu, and D. P. Pope 1992 6 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-008575; CONF-921101-98) Avail: CASI HC A02/MF A01

Single crystals of B-free Ni3Al, were cold rolled and recrystallized to produce crack-free polycrystals. Results show that the intrinsic ductility (approximately 16%) of Ni3Al (23.4 at. % Al) is considerably higher than previously thought; however, it is severely embrittled by moisture in air (ductility dropping from a high of approximately 16% when tested in oxygen to a low of approximately 3% in air). Since B-doped Ni3Al does not show such embrittlement, we conclude that a significant part of the beneficial effect of B must be related to suppression of this environmental effect. However, B must also improve grain boundary (GB) cohesion in Ni3Al, since our B-free alloy fractures intergranularly whereas B-doped alloys in general fracture transgranularly. Addition of 0.26 at. % of Zr to Ni3Al significantly improves its ductility: to 11-13% in air, and 48-51% in oxygen. The ductilities observed in oxygen are comparable to the highest ever ductility observed in B-doped Ni3Al, indicating that the GBs in this Zr-doped alloy are not intrinsically brittle (rather, environmental embrittlement is the main reason for its brittleness). Zr dramatically increases the resistance of Ni3Al to GB fracture perhaps by increasing GB cohesion. However, Auger analysis shows little or no Zr segregation on the GB's of Ni3Al, making it unclear how it might actually affect GB cohesion. Zr does not significantly increase the resistance of Ni3Al to environmental embrittlement; nor does it suppress intergranular fracture. In both these respects Zr behaves differently than B. DOE

N93-28902# Northwestern Univ., Evanston, IL.
TRANSFORMATION PLASTICITY IN DUCTILE SOLIDS
G. B. Olson Feb. 1993 5 p
(Contract DE-FG02-88ER-45365)
(DE93-008636; DOE/ER-45365/5) Avail: CASI HC A01/MF A01

Research has addressed the role of martensitic transformation plasticity in the enhancement of toughness in high-strength austenitic steels, and the enhancement of formability in multiphase low-alloy sheet steels. In the austenitic steels, optimal processing conditions have been established to achieve a significant increase in strength level, in order to investigate the interaction of strain-induced transformation with the microvoid nucleation and shear localization mechanisms operating at ultrahigh strength levels. The stress-state dependence of transformation and fracture mechanisms has been investigated in model alloys, comparing behavior in uniaxial tension and blunt-notch tension specimens. A numerical constitutive model for transformation plasticity has been reformulated to allow a more thorough analysis of transformation/fracture interactions. Processing of a new low alloy steel composition has been optimized to stabilize retained austenite by isothermal bainitic transformation after intercritical annealing. Preliminary results show a good correlation of uniform ductility with the austenite amount and stability. DOE

BAINITIC STABILIZATION OF AUSTENITE IN LOW ALLOY STEELS
M. L. Brandt and G. B. Olson 1992 9 p Presented at the ISS-AIME Symposium on Fundamentals of Aging and Tempering in Bainitic and Martensitic Steel Products, Warrendale, PA, 25-28 Oct. 1992
(Contract DE-FG02-88ER-45365)
(DE93-008275; CONF-9210322-1) Avail: CASI HC A02/MF A01

Stabilization of retained austenite via bainitic transformation was studied in a triple-phase, ferrite/bainite/austenite steel 0.26C1.52Si-1.2Mn. Volume fraction and stability of retained austenite are varied by isothermal transformation time at 752 F following intercritical annealing at 1418 F. Austenite stability is measured using the Bolling-Richman technique. Austenite content is measured by and austenite carbon content is estimated from lattice parameters. Strength and ductility measured in both uniaxial

and plane-strain tension are correlated with austenite amount and stability. While austenite content peaks at 3 minutes transformation time, stability continues to increase out to 5 minutes associated with a saturation of austenite carbon content and continued refinement of austenite particle size. Despite the reduced austenite content of 8 percent, the higher stability provided by the 5 minutes treatment gives superior mechanical properties.

ELECTROCHEMICAL BEHAVIOR AND SURFACE CHEMISTRY OF ALUMINUM ALLOYS: SOLUTE-RICH INTERPHASE MODEL Annual Report, 1 Dec. 1991 - 30 Nov. 1992
G. D. Davis, B. A. Shaw, B. J. Rees, E. L. Principe, and C. A. Pecile 31 Mar. 1993 41 p
(Contract N00014-85-C-0638)
(AD-A262061; MML-TR-93-04) Avail: CASI HC A03/MF A01

The electrochemical behavior of physical-vapor-deposited nonequilibrium stainless Al-W and Al-Ta alloys and the electrochemical behavior and surface chemistry of sputter-deposited nonequilibrium stainless Al-Ta alloys have been investigated. Results from the vapor-deposited alloys show that these materials possess enhanced passivity despite the presence of nodules and other defects. The stainless aluminum alloys that exhibit better performance are the sputter-deposited thin films that more uniform. Sputter-deposited Al-Ta alloys exhibit enhanced passivity over a pH range of 2 to 12 even though the passive film chemistry varies considerably over this range. This enhanced passivity can be explained by the solute-rich interphace model (SRIM), which claims that formation and passivation of occluded cells are controlled by localized concentrations of solute. The higher concentrations of solute at the metal-oxide interface and around occluded cells stabilize the passive film from continued chloride attack and dissolution.

THE ROLE OF GRAIN BOUNDARIES IN HYDROGEN DIFFUSION IN METALS AT 25 C
M. D. Danford Jun. 1993 17 p
(NASA-TM-108407; NAS 1.15:108407) Avail: CASI HC A03/MF A01

The effect of grain size on hydrogen diffusion at 25 C was examined for 4340 steel (body-centered cubic) and for Inconel 718 (face-centered cubic). It was found that the effect of grain size is important for body-centered cubic structures, but plays a much less important role in face centered cubic structures. Accurate measurements of hydrogen desorption coefficients during hydrogen desorption show that these are not greatly different for both types of structures.

OPERATIONAL RESULTS OF PILOT CELL TEST WITH CERMET INERT ANODES
T. R. Alcorn (Reynolds Metals Co., Muscle Shoals, AL.), A. T. Tabereaux (Reynolds Metals Co., Muscle Shoals, AL.), N. E. Richards (Reynolds Metals Co., Muscle Shoals, AL.), C. F. Windisch, Jr., D. M. Strachan, J. S. Gregg (Eltech Systems, Inc., Fairport Harbor, OH.), and M. S. Frederick (Eltech Systems, Inc., Fairport Harbor, OH.) Feb. 1993 12 p Presented at the Annual Meeting of The Metallurgical Society, Denver, CO, 21-25 Feb. 1993
(Contract DE-AC06-76RL-01830)
(DE93-009338; PNL-SA-21117; CONF-930202-4) Avail: CASI HC A03/MF A01

The operational performance of a 'six-pack' of cermet anodes and corrosion rates was evaluated in a six kA pilot reduction cell at Reynolds' Manufacturing Technology Laboratory. Two separate test periods were conducted with the cermet anodes; the first period was in conjunction with the Pacific Northwest Laboratory and the second with ELTECH Research Corporation. Both tests used identical NiO-NiFe2O4-Cu anodes manufactured by Ceramic Magnetics, Inc. The ELTECH testing involved the in situ coating of the anodes with cerium oxide. Primary evaluations for both test periods were conducted at target conditions of alumina saturation and 0.5 amp/sq cm anode current density. Individual anodes remained in operation for 25 days during the two and one-half month testing period. Operational difficulties developed throughout the test due to breakage of the anode conductor stems, cracking and breaking of the cermet anodes, unequal anode current distribution, and alumina muck build-up in the cell. These operational problems are discussed as well as an estimate of anode corrosion rates based on metal impurity levels in the aluminum metal pad.

REPORT ON THE SINTERING AND PROPERTIES OF MgO AND MgO-5 PERCENT TiC
M. Bengisu and O. T. Inal Jul. 1992 21 p Prepared in cooperation with Los Alamos National Lab., NM
(Contract W-7405-eng-36)
(DE93-008676; LA-Sub-93-11/1) Avail: CASI HC A03/MF A01

Sintering of technical grade MgO yields higher fractional densities compared to pure MgO. TiC reacts with MgO under sintering of MgO-TiC composites in air, yielding Mg2TiO4 and CO or CO2. This can be suppressed in vacuum by plasma sintering. Plasma sintering of MgO at 1300 C and short times does not produce satisfactory results. Five vol% TiC increases the sinterability of MgO during conventional air sintering; larger additions (50 vol%) decrease sinterability due to macropores formed by gaseous reaction product. Microwave sintering of MgO is possible. Mechanical properties of MgO are improved by additions of small amounts of TiC to starting powders. DOE

MATERIALS CHARACTERIZATION OF CERMET ANODES TESTED IN A PILOT CELL
C. F. Windisch, Jr., D. M. Strachan, C. H. Henager, Jr., T. R. Alcorn (Reynolds Metals Co., Muscle Shoals, AL.), A. T. Tabereaux (Reynolds Metals Co., Muscle Shoals, AL.), and N. E. Richards (Reynolds Metals Co., Muscle Shoals, AL.) Feb. 1993 11 p Presented at the Annual Meeting of The Metallurgical Society, Denver, CO, 21-25 Feb. 1993
(Contract DE-AC06-76RL-01830)
(DE93-008924; PNL-SA-21085; CONF-930202-5) Avail: CASI HC A03/MF A01

Cermet anodes were evaluated as nonconsumable substitutes for carbon anodes using a pilot-scale reduction cell at the Reynolds Manufacturing Technology Laboratory. After pilot cell testing, tile anodes were subjected to extensive materials characterization and physical properties measurements at the Pacific Northwest Laboratory. Significant changes in the composition of the cermet anodes were observed including the growth of a reaction layer and penetration of electrolytes, deep into the cermet matrix. Fracture strength and toughness were measured as a function of temperature and the ductile-brittle transition was reduced by 500 C following pilot cell testing. These results imply difficulties with anode material and control of operating conditions in the pilot cell, and suggest that additional development work be performed before the cermet anodes are used in commercial reduction cells. The results also highlight specific fabrication and operational considerations that should be addressed in future testing. DOE

INTERIM FATIGUE DESIGN CURVES FOR CARBON, LOW-ALLOY, AND AUSTENITIC STAINLESS STEELS IN LWR ENVIRONMENTS
S. Majumdar, O. K. Chopra, and W. J. Shack Jan. 1993 17 p Presented at the 20th Water Reactor Safety Information Meeting, Bethesda, MD, 21-23 Oct. 1992
(Contract W-31-109-eng-38)
(DE93-009202; ANL/MCT/CP-78588; CONF-921007-23) Avail: CASI HC A03/MF A01

Both temperature and oxygen affect fatigue life; at the very low dissolved-oxygen levels in pressurized water reactors (PWR's) and Boiling Water Reactors (BWR's) with hydrogen water chemistry, environmental effects on fatigue life are modest at all temperatures (T) and strain rates. Between 0.1 and 0.2 ppM, the effect of dissolved-oxygen increases rapidly. In oxygenated environments, fatigue life depends strongly on strain rate and T. A fracture mechanics model is developed for predicting fatigue lives, and interim environmentally assisted cracking (EAC)-adjusted fatigue curves are proposed for carbon steels, low-alloy steels, and austenitic stainless steels. MICROSTRUCTURAL EFFECTS ON THE DEFORMATION AND FRACTURE OF THE ALLOY Ti-25Al-10Nb-3B-1Mo Final Report, 1 Jul. 1988 - 15 Dec. 1992
Charles H. Ward, Jr. Dec. 1992 211 p
(AF Proj. 2306)
(AD-A263095; WL-TR-92-4104) Avail: CASI HC A10/MF A03

The effects of microstructure and temperature on tensile and fracture behavior were explored for the titanium aluminide alloy Ti-25Al-10Nb-3V-1Mo (atomic percent). Three microstructures were selected for this study in an attempt to determine the role of the individual microstructural constituents. The three microstructures studied were an alpha-2 + beta processed microstructure with a fine Widmanstaetten microstructure, a beta processed microstructure with a fine Widmanstaetten microstructure, and a beta processed microstructure with a coarse Widmanstaetten microstructure. Tensile testing of both round and flat specimens was conducted in vacuum at elevated temperature and in air at room and elevated temperatures. Extensive fractography and specimen sectioning were used to study tensile deformation and the effects of environment on this alloy. Room temperature fracture toughness testing using compact tension specimens was conducted. Elevated temperature toughness testing was performed using J-bend bar specimens in an air environment. Again, extensive fractography and specimen sectioning were used to study the elevated temperature toughening mechanisms of this alloy. DTIC

Cr3Si is alloyed with molybdenum which produces a two-phase micro structure of (Cr,Mo)3Si and (Cr,Mo)5Si3. The alloy forms two protective oxides over a wide range of temperatures. Chromium and molybdenum oxide volatize under flowing air at high temperatures above 1200 C which facilitates the formation of SiO2 on the surface. Below 1200 C Cr203 is formed. The new alloy has excellent high temperature strength and creep properties. NASA

POTENTIAL TRANSMISSION AND TRANSIENTS DURING CORROSION: APPLICATIONS TO CORROSION MONITORING
H. S. Isaacs and Jeong-Hwan Cho 1992 11 p Presented at the International Conference on Advances in Corrosion and Protection, Manchester, England, 28 Jun. 1992
(Contract DE-AC02-76CH-00016)
(DE93-010863; BNL-48601; CONF-9206234-2) Avail: CASI HC A03/MF A01

The transmission of potential along a passive metal/electrolyte interface, which is important in corrosion monitoring, has been considered for transitory and sustained corrosion processes. The observed signals are modified and delayed by the passive surface. Using a transmission line as the equivalent circuit of a pipe and incorporating the impedance characteristics of the passive-metal/solution interface, enabled an analysis of the effectiveness of corrosion monitoring methods to be performed. IN SITU FOURIER TRANSFORM INFRARED SPECTROSCOPIC STUDY OF BISULFATE AND SULFATE ADSORPTION ON GOLD, WITH AND WITHOUT THE UNDERPOTENTIAL DEPOSITION OF COPPER
Diane B. Parry, Mahesh G. Samant, H. Seki, Michael R. Philpott, and Kevin Ashley 14 Apr. 1993 46 p
(Contract N00014-92-C-0173)
(AD-A263421; TR-05) Avail: CASI HC A03/MF A01

In situ surface infrared (IR) spectroelectrochemistry is used to investigate the adsorption of sulfate (SO4(2-)) and bisulfate (HSO(4-)) ions on polycrystalline gold surfaces in sodium sulfate and sulfuric acid, and also during copper underpotential deposition in sulfuric acid medium. In sodium sulfate solution, IR peaks due to surface sulfate and bisulfate are observed at potentials within the double-layer region on gold, and the ratio of IR peak intensities for sulfate to bisulfate increases as the applied potential is made more negative. In sulfuric acid, surface IR spectra indicate that adsorbed sulfate is favored at more positive potentials, while adsorbed bisulfate is prevalent at more negative voltages; also, a potential-dependent reorientation of water is observed in the spectra. IR spectroelectrochemical data from a sulfuric acid system containing copper sulfate indicate that adsorbed sulfate is present on gold at more positive potentials, and its coverage increases when underpotentially deposited (UPD) copper is present on the gold substrate surface. EFFECTS OF INTERNAL HELIUM ON MECHANICAL PROPERTIES OF NITRONIC (TM) 40 STAINLESS STEEL

W. C. Mosley 1993 4 p Presented at the 18th Department of Energy (DOE) Compatibility, Aging and Service Life Conference, Aiken, SC, 20-22 Apr. 1993
(Contract DE-AC09-89SR-18035)
(DE93-009902; WSRC-MS-93-134; CONF-9304103-2) Avail: CASI HC A01/MF A01

This report describes results of tests on annealed Nitronic 40 stainless steel containing 0.0, 0.26, and 2.6 appM helium-3 (He-3), over the temperature range 25-842 C. Ultimate tensile strength, 0.2% offset yield strength, total elongation, uniform elongation, nonuniform elongation, and reduction-in-area were measured. The predominant effect of He-3 is decreased ductility caused by inhibition of necking. Annealed Nitronic 40 exhibits greater sensitivity to internal He-3 than solution-annealed Incoloy 903 and high-energy-rate forged 316L stainless steel. DOE

EXPERIMENTAL STUDY OF LOCATION AND IDENTIFICATION OF FERROUS SPHEROIDS USING A SMART TOTAL FIELD MAGNETOMETER

John E. McFee, Robert Ellingson, and Yogadhish Das Jan. 1993 109 p
(AD-A263661; DRES-SR-582) Avail: CASI HC A06/MF A02

A microprocessor-controlled magnetometer which accurately locates and identifies compact ferrous objects in real-time is described. The person-portable instrument consists of a cart-mounted cesium magnetometer, optical encoder, microcontroller, interface, and laptop computer. The instrument guides the operator to collect simultaneous magnetic field and position data in a horizontal plane above an object. Custom algorithms estimate location and dipole moment and use the latter to classify the object. Data collection takes 6 - 13 minutes, location and moment estimation 5 seconds, classification 30 seconds. Experiments using two ferrous spheroids and studies using magnetic total field and vertical component magnetic maps generated by a mathematical computer model are described. Limits of error in estimation of location and dipole moment, error in classification, and relative effects of sources of error are quantified. The rms error for location vector components was 0.019 m - 0.045 m compared to the average precision of 0.003 m - 0.005 m. The average magnitude of the difference between estimated and theoretical dipole moment vectors as a percentage of the theoretical dipole moment was 24.5 +/- 11.4% compared to precision of 0.51 - 8.21%. Pattern classification with a computer generated dipole moment design set is described. Deviation between experimental moment estimates and the computer model degraded performance but the misclassification rate for the two objects for which experimental measurements were made was 11.1%. If an experimental design set were used, analysis shows that the limiting misclassification error for the present experimental precision should be between 2 and 5%. DTIC

LOW TEMPERATURE ENVIRONMENTAL EMBRITTLEMENT IN ORDERED INTERMETALLICS

N. S. Stoloff (Rensselaer Polytechnic Inst., Troy, NY.) and C. T. Liu 1992 43 p Presented at the Workshop on Ordered Intermetallics, Honzhou, China, 28 Sep. - 1 Oct. 1992
(Contract DE-AC05-84OR-21400)
(DE93-009711; CONF-9209328-1) Avail: CASI HC A03/MF A01

There are two types of environmental degradation in intermetallics: hydrogen-induced embrittlement occurring at ambient temperatures, and oxygen-induced embrittlement in air at high temperatures. This review is confined to low-temperature embrittlement and discusses metallurgical means of alleviation. Environmentally induced embrittlement is both pernicious and complex. The low ductility and toughness of many ordered alloys, especially aluminides, at room temperature (RT) is now known to arise from an extrinsic effect. Exclusion of moisture or other sources of H from environment causes Ni3Al, Ni3Si, Fe3Al, and FeAl to display high elongations. However, even when H is excluded, other aluminides (NiAl, CoAl, TiAl, Ti3Al) exhibit little or no RT ductility. Reasons for this difference is complex; the number of independent slip systems, bonding, and differences in environmental susceptibility are the most obvious factors affecting ductility. Grain size/shape, alloy texture, and impurity content are among the factors influencing environmental embrittlement. Each factor needs to be studied for most intermetallics for possible structural applications. DOE

MECHANISMS OF FRACTURE AND CREEP OF STRUCTURAL ALLOYS Annual Report, 1 Jan. 1992 - 28 Feb. 1993

D. A. Koss 29 Mar. 1993 37 p
(Contract N00014-91-J-1414)
(AD-A263108; TR-6) Avail: CASI HC A03/MF A01

Progress is reviewed for research which focuses on two aspects which limit the performance of structural alloys. First, in a study generic to a wide range of materials, we are determining the mechanisms, as well as local failure criteria, by which voids grow, interact and link during ductile fracture due to damage accumulation. Secondly, in a study focused specifically at high strength titanium alloys, we are examining the deformation and fracture behavior of novel beta titanium alloy Ti-23Nb-11Al, which is age-hardenable by the formation of ordered precipates based on Ti3Al. Progress for the period January 1, 1992 to February 28, 1993 is reviewed for the following projects: (1) two-dimensional modeling studies of void linking during ductile, microvoid fracture, (2) a three-dimensional experimental modeling study void growth and linking during ductile fracture, and (3) the influence of temperature on the deformation and oxidation behavior of a new age-hardenable beta titanium alloy. INTERFACIAL VISCOSITY MEASUREMENTS OF ADSORBED MONOLAYERS ON METAL SURFACES Final Report, 1 May 1990 - 31 Oct. 1992

Jacqueline Krim 31 Oct. 1992 5 p
(Contract N00014-89-J-1853)
(AD-A263288) Avail: CASI HC A01/MF A01

At the outset of this project, we had just developed a technique, employing a quartz crystal microbalance, for measuring the sliding friction coefficient of a molecularly thin film adsorbed on a metal surface. Funding of the project allowed us to carry out a range of measurements documenting the friction coefficient under various circumstances. The measurements were the first of any kind to quantitatively probe how much force is required on average to slide an atom across an interface, and were in the mainstream of the emerging field of nanotribology (a word coined by our group). They hold the world record for the shortest time scale on which friction experiments have been carried out, allowing them to be exactly modelled by molecular dynamics simulations. DTIC

SOME EFFECTS OF COMPOSITION AND MICROSTRUCTURE ON THE B2 IN EQUILIBRIUM TO DO3 ORDERED PHASE TRANSITION IN Fe3Al ALLOYS
P. J. Maziasz, C. G. McKamey, O. B. Cavin, C. R. Hubbard, and T. Zacharia 1992 9 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-009724; CONF-921101-102) Avail: CASI HC A02/MF A01

Binary Fe-28 at.% Al alloys (Fe3Al-type) transform from B2 yields DO3 ordered phases at 550 C upon cooling. More complex Fe-28Al alloys can have B2 yields DO3 transition temperatures that range from 530 to 670 C. Kinetics of the B2 yields DO3 ordered phase transition also appear to be affected by alloy composition and by matrix dislocation microstructure. The binary and Nb-containing ternary alloys have rapid B2 yields DO3 transition kinetics during cooling. However, the ternary or more complex alloys that contain Cr have relatively slower phase transition kinetics during similar cooling. Deformation of a complex Fe-28Al-5Cr alloy in the B2 phase regime creates a very high matrix dislocation concentration, which coincides with complete suppression of the B2 yields DO3 phase transition during cooling. DOE

PLATINUM-MODIFIED DIFFUSION ALUMINIDE COATINGS ON NICKEL-BASE SUPERALLOYS Final Report, Jun. 1985 - Jun. 1988
G. M. Kim, G. H. Meier, and F. S. Pettit Mar. 1993 32 p
(Contract DAAG46-85-K-0008)
(AD-A263597; ARL-CR-50) Avail: CASI HC A03/MF A01

Conventional and platinum modified diffusion aluminide coatings on some state-of-the-art single crystal and polycrystalline nickel-base superalloys have been compared in tests designed to establish conditions representative of those existing in gas turbines operating over a range of applications. Resistance of these coatings to oxidation, high temperature hot corrosion, and low temperature hot corrosion have been compared. Platinum has been found to significantly improve the resistance of diffusion aluminides to all of these forms of degradation but the improvement with regard to low temperature hot corrosion is not as great as in the case of the other two forms of attack. Substrate composition has been found to exert a very significant effect on the lives of coatings in the high temperature tests. In the case of high temperature oxidation elements such as Hf are important in that they extend coating lives whereas for high temperature hot corrosion the type and concentration of refractory elements are significant factors affecting coating lives. A limited number of experiments have indicated intermittent hot corrosion exposures degrade the subsequent cyclic oxidation resistance of Pt-aluminide coatings. DTIC

STRUCTURE, ADHESION, AND STABILITY OF METAL/OXIDE AND OXIDE/OXIDE INTERFACES
R. J. Lad Nov. 1992 9 p
(Contract DE-FG02-90ER-45417)
(DE93-012930; DOE/ER-45417/4) Avail: CASI HC A02/MF A01

Studies of structural, electronic, and chemical properties of metal/oxide and oxide/oxide interfaces were performed on well-defined interfaces that were created by depositing ultra-thin potassium and aluminum films and their oxides onto single crystal TiO2 and NiO surfaces. Work focused on the following: determining the structure, growth mechanisms, and morphologies of metal and oxide films as they are deposited on single crystal oxide surfaces using RHEED and atomic force microscopy; probing electronic structure, bonding, and chemical interactions at the interfaces using x-ray and uv photoelectron spectroscopies (XPS, UPS) and Auger electron spectroscopy (AES); and understanding factors affecting stability and reactivity of the interface regions including the role of defects and impurities. Results indicate that kinetic effects have an important influence on interface structure and composition, and they also show that defects in the oxide substrate induce new electronic states at the interface which play a major role in cation-anion bonding and interface interactions. The results establish a link between electronic and chemical bonding properties and the interface structure and morphology, which is required to successfully manipulate the interfacial properties of advanced ceramic materials. IMPROVEMENT IN DUCTILITY OF THE INTERMETALLIC COMPOUND Ti3Al
Isabelle Ehrhart (Office National d'Etudes et de Recherches Aerospatiales, Paris, France.) Aug. 1992 179 p Transl. into ENGLISH of Contribution a l'Amelioration de la Ductilite du Compose Intermetallique Ti3Al (Paris, France, ONERA) 1991 p 1-143 Original language document was announced as N92-19440
(ESA-TT-1276; ONERA-NT-1991-6; ETN-93-93716) Avail: CASI HC A09/MF A02

Adding a beta-stabilizing element like vanadium to Ti3Al improves ductility by refining the microstructure and retaining the high temperature beta phase. The beta phase has an ordered structure of the B2 type. Its transformation during aging at 400 or 500 C was studied by transmission electron microscopy. The ordered omega phase which precipitates in beta undergoes a complex reordering reaction over prolonged aging times. The equilibrium alpha(sub 2) phase appears within the beta matrix at higher aging temperatures. Investigation of ternary Ti3Al + V alloys with a duplex alpha(sub 2) + beta microstructure revealed that the addition of about 10 at.% V is required to obtain a sufficient degree of ductility at room temperature. Their tensile strength and elongation to rupture depend on the volume fraction and morphology of the two phases, which can be varied by following thermomechanical and heat treatments. An attempt was made to improve the plasticity of the alpha(sub 2) phase by introducing lattice defects in the ordered structure. The effect of deviations from stoichiometry and addition of zirconium or tin was investigated. A decrease in aluminum content enhances ductility quite significantly while zirconium improves the strength and tin has very little effect. A vanadium content of more than 4 at.% has a detrimental effect on the oxidation resistance of Ti3Al. ESA

The production of titanium nitrides and carbides by laser fusion with methane or nitrogen as a reaction gas is considered. The process parameters, such as optical elements, energy, radiation absorption, and their influence in ceramics layer quality, were examined. It is highlighted that nitrogen allows a higher surface hardness and a larger layer thickness than methane. The process gas composition is shown to be important: surface hardness increases with nitrogen/argon mixture ratio and with gas flow angle. A eutectic titanium iron alloy was deposited on cast iron and carbon steel substrates by low pressure plasma spraying and it was melted with a dioxide carbon laser by using varied process gases. TiC is shown to be produced by reaction with carbon of cast iron, and the intermetallic TiFe is produced in the layer. ESA

The comparison of plastic deformation behavior of dispersion strengthened titanium (with small Y2O3 particles) with unalloyed titanium is reported. In each temperature domain, the contribution of dispersion strengthening was studied, especially compared with that of interstitial impurities. In high temperature range (500 to 700 C), a detailed study of creep properties showed that dislocation mechanisms control the creep behavior of both binary Ti-Y alloys and unalloyed Ti. The strengthening is the consequence of the increasing of the internal stress (threshold stress). It was shown that dislocation-particle attractive interaction mechanisms control the dislocation motion. It was also apparent that the presence of interstitial impurities (carbon or oxygen) may drastically improve the creep strength of alpha titanium. In the intermediate temperature range (300 to 500 C), the study of Dynamic Strain Aging (DSA) and Static (or relaxation) Aging (SA) was conducted. The experimental results were compared with the most recent developments of DSA and SA models. A model for transients after SA and strain rate change tests is proposed. In the low temperature range (below 300 C and especially below room temperature), the deformation of titanium is controlled by Peierl's mechanisms. The most important strengthening factor is thus the oxygen (or carbon) content. The influence of the oxide dispersion is quite negligible so that the binary Ti-Y alloys are softer than unalloyed Ti (containing oxygen). ESA

IRRADIATION ASSISTED STRESS CORROSION CRACKING OF STAINLESS STEEL IRRADIATED IN FBR

Takashi Tsukada, Kiyoyuki Shiba, and Hajime Nakajima Nov. 1992 49 p
(DE93-764495; JAERI-M-92-165) Avail: CASI HC A03/MF A01

Japan Atomic Energy Research Institute (JAERI) and Power Reactor and Nuclear Fuel Development Corporation (PNC) initiated a cooperative research on the evaluation of fracture behaviors of neutron irradiated material in 1991. The research program includes a study of stress corrosion cracking (SCC) of the wrapper tube material of fuel assembly irradiated in the experimental fast reactor 'JOYO'. By August 1992 SCC tests by the slow strain rate technique (SSRT) were carried out on the irradiated material. In this cooperative program the wrapper tube material of type 316 stainless steel irradiated in 'JOYO' up to a neutron fluence of 8 x 10(sup 22) n/cm(sup 2) (E greater than 0.1 MeV) at about 425 C was tested by SSRT at 60 C, 200 C and 300 C in the water environment at the hot laboratory of JAERI. The tests showed that the irradiated wrapper tube material fractured by fully ductile mode at 60 C in high purity water with dissolved oxygen of 32 ppm but it was fractured by intergranular cracking at 300 C in the same environment. It is concluded that the stainless steel irradiated in FBR has no susceptibility to SSC at 60 C but susceptibility appears at the higher temperatures in the water. DOE

ORDER-DISORDER TRANSFORMATIONS IN Ni-Al ALLOYS

M. Sluiter and P. E. A. Turchi Aug. 1992 5 p Presented at the 2nd International Conference and Exhibition on Computer Applications to Materials and Molecular Science and Engineering, Yokohama, (Japan), 22-25 Sep. 1992
(Contract W-7405-eng-48)
(DE93-009293; UCRL-JC-109944; CONF-920927-3) Avail: CASI HC A01/MF A01

A brief introduction to the first-principles electronic theory of alloy phase stability is presented and applied to the study of phase equilibria in Ni-rich Ni-Al alloys. The thermodynamics of phases based on the fcc and bcc lattices are treated within various approximate solutions to the Ising Hamiltonian by means of the Cluster Variation Method and phase diagrams are computed. Particular attention is paid to the existence of the ordered phase at Ni5Al3 at low temperatures. It must be noted that only fcc- and bcc-based phases are considered and that the liquid alloy is ignored. DOE

EXAMINATION OF FORMABILITY TO SEAMLESS TUBES ON Ni-Cr-W SUPERALLOY

Hirokazu Tsuji, Hajime Nakajima, Masao Ohashi, and Masahiro Takemura Oct. 1992 138 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-764158; JAERI-M-92-148) Avail: CASI HC A07

Research and development have been carried out on the new superalloys as a component material for process heating high-temperature gas-cooled reactors with coolant outlet temperatures of around 1000 C, and the optimum chemical composition has already been proposed. The program had set some targets. One of them is formability to 32-mm-outer dia., 4- to 5-mm-thick, 7-m-long seamless tubes. Hence formability and solution treatment conditions were examined by producing seamless tubes from 2000 kg scale ingot of the proposed optimum Ni-Cr-W superalloy. Based on the obtained results, the following conclusions are drawn: (1) Newly developed Ni-Cr-W superalloy possesses sufficient formability to seamless tubes in both hot- and cold-workability. (2) The grain size of the seamless tubes can be adjusted in a range of ASTM No. 2 to 3 by solution treated at 1230 to 1240 C. DOE

DEVELOPMENT OF Ni-Cr-W SUPERALLOYS FOR HIGH TEMPERATURE COMPONENTS IN HIGH TEMPERATURE GAS-COOLED REACTORS, PART 2

Sep. 1992 84 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-764469; JAERI-M-92-137) Avail: CASI HC A05

Research and development have been carried out on the new superalloys as a component material for process heating high temperature gas-cooled reactors with coolant outlet temperatures of around 1000 C. The program aims at developing new superalloys which are well balanced in high temperature strength, corrosion resistance, producibility, weldability, etc. This report, the second series of development of Ni-Cr-W superalloys, is describing the results of the qualification tests performed by the Subcommittee on Advanced Superalloys from FY 1987 to FY 1990 for the evaluation of the fourth, the fifth and the sixth experimental alloys after the interim report, i.e., the first series. Based on the obtained results, it has been concluded that Ni - 18 to 19 mass % Cr - 20 to 22 mass % W - 0.03 mass % C - 0.08 mass % Ti - 0.02 to 0.05 mass % Zr - 0.002 to 0.007 mass % Y - 0.0035 to 0.006 mass % B is the optimum chemical composition. CONSTITUTIVE LAWS FOR DEFORMATION AND DYNAMIC RECRYSTALLIZATION IN CUBIC METALS

U. F. Kocks and S. R. Chen 1993 9 p Presented at the 7th International Symposium of the Japan Institute of Metals: Aspects of High Temperature Deformation and Fracture of Crystalline Materials, Nagoya, Japan, 28-31 Jul. 1993
(Contract W-7405-eng-36)
(DE93-010740; LA-UR-93-1065; CONF-930729-1) Avail: CASI HC A02/MF A01

We describe two cases in which constitutive laws for deformation kinetics are available that are both physically well founded and experimentally well obeyed. New experiments on Al-Mg alloys, in the regime of viscous deformation, fit the solute drift equation very well, with n-3 and Q(sub D) unadjustable; they do not fit the solute drag model. The high-stress regime, as well as all data for pure copper, fit the model of hardening and dynamic recovery, at least up to temperatures of 0.6 T(sub m). In both cases, dynamic recrystallization occurs at high temperatures. It seems to follow rather than determine the deformation kinetics. DOE

PHOTO-DESORPTION FROM COPPER ALLOYS

W. A. Barletta, M. Calderon, C. Foerester, H. Halama, and G. Korn Jul. 1992 9 p Presented at the International Conference on High Energy Accelerators, Hamburg, Germany, 20-24 Jul. 1992
(Contract W-7405-eng-48)
(DE93-011872; UCRL-JC-109741; CONF-920706-51) Avail: CASI HC A02/MF A01

In support of PEP-2, a high luminosity B factory, photodesorption of Cu alloys were measured to demonstrate suitability for ultra-high performance under high radiation loads. Results show that eta(sub eff) less than or = 2 x 10(exp -6) mol/photon is a practical design value for Cu vacuum chambers. Commissioning times to attain this value in B factories can be expected to be less than 50 h. Pre-cleaning with Ar glow discharge was shown to be effective. DOE

THE ELECTRODEPOSITION OF LOW CONTRACTION CHROMIUM USING HIGH/LOW CURRENT PULSING
Mark D. Miller and Stephen Langston Mar. 1993 17 p
(AD-A264475; ARCCB-TR-93012) Avail: CASI HC A03/MF A01

The effects of high/low current pulse plating on the electrodeposition of low contraction (LC) chromium were evaluated and compared to direct current-electrodeposited LC chromium with respect to microstructure and mechanical properties. A systematic experiment was performed in which three high/low current densities, 200/100, 200/60, and 200/30 A/dm(exp 2), were tested. The high current density time was varied from 0.6 to 60 ms, while the low current density time was kept constant at 30 ms. A high/low condition of 200/100 A/dm(exp 2) for 0.6/30 ms resulted in the overall optimal microstructure and mechanical properties with a resulting hardness value of 900 KHN, a cathode current efficiency of 22.1 percent, and an ultimate tensile strength of 25.8 Ksi. The deposit at this condition was crack-free with a typical columnar microstructure of fine fibrous grains and a (211) preferred orientation. DTIC

COORDINATION COMPOUNDS OF ALUMINUM AS PRECURSORS TO ALUMINUM NITRIDE Technical Report No. 8
Leonard V. Interrante May 1993 17 p
(Contract N00014-91-J-1917)
(AD-A264700) Avail: CASI HC A03/MF A01

Two different systems were examined as potential sources of aluminum nitride, an important electronic and structural ceramic material. Cyclic organoaluminium amides obtained as intermediates in the thermolysis of trialkylaluminium: ammonia Lewis acid-base complexes were used to obtain AIN powder and as precursors for the chemical vapor deposition of AIN films. The structures of two of these intermediates were determined by single-crystal x-ray diffraction (XRD) and the kinetics and thermodynamics of their formation and thermal decomposition reactions were also studied. The second system employs ethylenediamine as the Lewis base in combination with the R3Al(R= Me, Et) compounds. A 2:1 ratio of Et3Al with en yields a hydrocarbon-soluble, polymeric amide on thermolysis, which can be used to prepare AIN films by solution coating followed by pyrolysis in NH3. Lower proportions of R3Al to en, on thermolysis, lead to the formation of R(sub m)Al(en-2H)(sub n) cluster species that contain 5- and 6-coordinated Al atoms chelated and bridged by en-2H ligands. On further heating, these cluster species apparently go on to form cross-linked, insoluble, polymeric networks through condensation reactions involving the multiple N-H and R-Al groups on the periphery of the duster molecules. The structures of two of these Al-en duster compounds were determined by single-crystal XRD. DTIC

REACTIVE SINTERING OF NI3AI INTERMETALLIC ALLOYS UNDER COMPRESSIVE STRESS
K. H. Wu (Florida International Univ., Miami.) and C. T. Liu 1992 6 p
Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC05-84OR-21400)
(DE93-009729; CONF-921101-109) Avail: CASI HC A02/MF A01

Synthesis of the Ni-25% at. Al intermetallic compound by the thermal explosion mode subject to the application of compressive stress was systematically investigated. The stress was applied prior to the reaction. It was proved that the compressive stress had a profound effect on the reaction, as well as the densification. At a relatively low stress, a full reaction could be completed and the major phase of the final product is Ni3Al. At higher stresses, a partial reaction was resulted, and the final product was primarily the intermediate phases, Ni and NiAl. Three distinct reaction products were obtained in this study. When the stress was below approximately 5 MPa, a fully reacted product was obtained. Between 5 and 15 MPa, a fully and partially reacted zone coexisted. Above 15 MPa, only a partial reaction prevailed. In this experiment, a final product of 99.9% relative density was obtained at the high stress level. DOE

EFFECTIVE INTERACTIONS BETWEEN CONCENTRATION FLUCTUATIONS AND CHARGE TRANSFER IN CHEMICALLY ORDERING LIQUID ALLOYS
Z. Akdeniz and M. P. Tosi Aug. 1992 10 p
(DE93-606724; IC-92/204) Avail: CASI HC A02/MF A01 (US Sales Only)

The correlations between long-wavelength fluctuations of concentration in a liquid binary alloy are determined by a balance between an elastic strain free energy and an Ornstein-Zernike effective interaction. The latter is extracted from thermodynamic data in the case of the Li-Pb system, which is well known to chemically order with stoichiometric composition corresponding to Li4Pb. Strong attractive interactions between concentration fluctuations near the composition of chemical ordering originate from electronic charge transfer, which is estimated from the electron-ion partial structure factors as functions of composition in the liquid alloy. OXIDATION AND HOT CORROSION OF SUPERALLOYS RENE 100 AND X-40 AT TEMPERATURES OF 1475 F TO 2000 F Final Report
M. Levy, J. J. Falco, and F. Pettit Feb. 1993 25 p
(AD-A263747; ARL-TR-87) Avail: CASI HC A03/MF A01

The oxidation resistance and hot corrosion resistance of two superalloys, Rene 100 and X-40, and an aluminide coating for the protection of one of the superalloys are compared. The comparison is made by using tube-furnace oxidation and hot corrosion tests employing a Mettler TGA apparatus at temperatures of 1475 to 2200 F. For hot corrosion tests, the samples were precoated with Na2SO4 prior to heating to the desired temperature and introducing air at a flow rate of 57 cm/min. The oxidation behavior of Rene 100 was poor compared to that of the X-40 alloy, especially at temperatures above 1900 F. The X-40 alloy was found to be more resistant to the initiation of hot corrosion than Rene 100. Both alloys, however, undergo attack at rates consistent with an alloy-induced fluxing mechanism. An aluminide coating on Rene 100 caused the initiation of hot corrosion to be delayed. Attack did occur when cumulative applications of Na2SO4 were used. The coatings were penetrated by the Na2SO4 in localized areas after exposure times of less than 200 hours. The hot corrosion test has validity for mechanisms whereby the degradation process is sustained by reaction products from the alloy. It, therefore, can be used to compare the time to establish such conditions in alloys. Rene 100 is more susceptible to this condition than X-40. DTIC

Organic and pre-ceramic coating systems that appear to have high potentials for being cost-effective solutions to corrosion problems encountered in condensing heat exchangers have been identified. The results from the ongoing basic research have been transferred to applied R&D by commercial manufacturers of heat exchangers. Two high performance polyaryl-type polymers, polyphenylene sulfide and polyphenylether-etherketone, have given excellent results when deposited as thin (2-3 mil) coatings on cold-rolled steel substrates. The effectiveness of chemical modification of the steel surface prior to the application of the polymer topcoat as a means for bond enhancement and the formation of chemically resistant reaction products at the interface has been studied, but the results to date are inconclusive. Thin (0.5 to 2.0 micron) coatings of polytitanosiloxane applied to aluminum using sol-gel techniques have also given excellent corrosion resistance. Methods for using the system to chemically bond organic coatings to aluminum and to stabilize interfacial reaction products are currently being evaluated. NTIS

EUTECTIC SOLIDIFICATION OF Al-U AT SLOWLY COOLING RATES (10 C PER SECOND)

A. Munitz, V. Y. Zenou, C. Cotler, and E. Nehama May 1992 42 p In HEBREW
(DE92-640082; NRCN-612) Avail: CASI HC A03/MF A01 (US Sales Only)

The solidification of Al-U alloys at slow cooling rates was investigated using optical and scanning microscopy. High purity uranium (99.9%) and high purity aluminum (99.9%) or 'commercially pure' Al-A5 (Al-1050) alloy containing a maximum of 0.5% wt/o of other alloying elements were used to prepare Al-U alloys in a resistance furnace under controlled atmosphere. The observed eutectic composition for U-(Al-A5) was 17 +/- 1 wt/o U, while that for U and pure Al was 19(+-)1 wt/o U. These values are significantly different than the value of 13 wt/o U, reported in the literature. The eutectic morphology and its distribution depends on the type of the aluminum used in preparing the alloy. In both cases eutectic colonies were observed. In alloys prepared with pure Al, the eutectic colonies have a diameter less than 0.2 mm, display a lamellar morphology, and are homogeneously distributed. In alloys prepared with Al-A5, at list 4 different types of eutectic morphologies were observed. Some of the eutectic colonies have diameters as large as 2 to 3 mm. Some interesting nonequilibrium morphological features were observed in the specimen containing hypereutectic compositions. The above results are discussed on the basis of current solidification theories. DOE

A REVIEW OF HOT CRACKING IN AUSTENITIC STAINLESS STEEL WELDMENTS

V. Shankar, T. P. S. Gill, S. L. Mannan, and P. Rodriguez 1991 83 p
(DE93-605280; IGC-119) Avail: CASI HC A05/MF A01 (US Sales Only)

The occurrence of hot cracking in austenitic stainless steel weldments is discussed with respect to its origin and metallurgical contributory factors. Of the three types of hot cracking, namely solidification cracking, liquation and ductility dip cracking, solidification cracking occurs in the interdendritic regions in weld metal while liquation and ductility dip cracking occur intergranularly in the heat-affected zone (HAZ). Segregation of impurity and minor elements such as sulphur, phosphorous, silicon, niobium, boron, etc. to form low melting eutectic phases was found to be the major cause of hot cracking. Control of HAZ cracking requires minimization of impurity elements in the base metal. In stabilized stainless steels containing niobium, higher amounts of delta-ferrite were found necessary to prevent cracking than in unstabilized compositions. Titanium compounds were found to cause liquation cracking in maraging steels and titanium containing stainless steels and superalloys. In nitrogen added stainless steels, cracking resistance decreases when the solidification mode changes to primary austenitic due to nitrogen addition. A review of the test methods to evaluate hot cracking behavior showed that several external restraint and semi-self-restraint tests are available. The Finger Test, WRC Fissure Bend Test, the PVR Test, and the Varestraint Test are described along with typical test results. Hot ductility testing to reveal HAZ cracking tendency during welding is described, which is of particular importance to stabilized stainless steels. Based on the literature, recommendations are made for welding stabilized and nitrogen added steels, indicating areas of further work. DOE

COMPATIBILITY STUDIES OF AISI TYPE 316 STAINLESS STEEL WITH LEAD-LITHIUM EUTECTIC ALLOY

A. Joseph, K. V. Kasiviswanathan, and Baldev Raj 1991 71 p
(DE93-605281; IGC-122) Avail: CASI HC A04/MF A01 (US Sales Only)

Spent fuel subassemblies from the Fast Breeder Test Reactor (FBTR) are to be stored in leak tight containers until they are required to be sent for reprocessing. Use of advanced fuels like uranium carbides and plutonium carbides, which are known to be highly chemically active with oxygen and moisture demands adequate leak tightness during long term storage to avoid undesirable chemical reactions. Use of low melting alloys which acts as liquid/solid sealants in the storage containers in which fuel subassemblies are to be kept is being considered for this purpose. Lead-lithium (0.7 wt % lithium) eutectic alloy was chosen as one of the candidate alloys for the purpose on the basis of theoretical assessments. The candidate sealing alloy should have good compatibility with the structural materials of fuel subassemblies as well as the fuel and fission products. AISI type 316 stainless steel in solution annealed, ten and twenty percent cold worked condition is the clad and wrapper material used for the fabrication of fuel pins and subassemblies. Compatibility studies between eutectic Pb-Li alloy and AISI type 316 stainless steel material in the above conditions were undertaken at different temperatures and time durations. The studies indicate that the tensile properties of AISI type 316 stainless steel are not subject to any serious jeopardization through contact with this molten Pb-Li eutectic alloy for periods extending even up to 7000 hours at 873 K. Thus use of Pb-Li eutectic alloy would be suitable for the storage of irradiated fuel. DOE

POLAR ORDER AND RELAXATION OF SECOND ORDER NONLINEAR OPTICAL SUSCEPTIBILITY IN AN ELECTRIC FIELD POLARIZED AMORPHOUS POLYMER
C. H. Wang, S. H. Gu, and H. W. Guan 1993 28 p LIMITED REPRODUCIBILITY: More than 20% of this document may be affected by microfiche quality
(Grant NSF DMR-91-12993)
(AD-A262189; TR-22) Avail: CASI HC A03

The dependence of the second harmonic generation (SHG) signal of an amorphous polymer system containing nonlinear optical (NLO) chromophores on the polarizing electric field is investigated. It is shown that under a weak poling field condition, the SHG intensity is proportional to E sub p squared, provided that the polarizing electric field E sub p is greater than a threshold field, E sub s. Above E sub s the macroscopic polar orientational order is established. The lengthening of the relaxation time for polar orientational order with increasing E sub p is also observed. Theoretical analysis shows that the relaxation time is proportional to the polar order initially induced by the polarizing field. Experiments have been carried out to confirm the theoretical prediction. DTIC

MECHANICS OF ELEVATED TEMPERATURE FATIGUE DAMAGE IN FIBER-REINFORCED CERAMICS Final Report, 1 Dec. 1990 - 30 Nov. 1992
John W. Holmes Jan. 1993 73 p
(Grant AF-AFOSR-0106-91)
(AD-A262403; AFOSR-93-0172TR) Avail: CASI HC A04/MF A01

The focus of the research conducted under Grant No. 91-0106 (a two year effort) was to identifying the fundamental mechanisms of fatigue damage that occur in fiber-reinforced ceramics. Several new findings were made during the research effort: (1) the fatigue life of fiber-reinforced ceramics decreased markedly during high frequency fatigue loading, (2) fiber-reinforced ceramics undergo significant internal heating during cyclic loading, (3) because of frictional wear along the fiber-matrix interface, the frictional shear stress in fiber-reinforced ceramics decreases sharply under cyclic loading. Based upon insight gained from the analytical and experimental parts of the investigation, we developed a novel approach to estimate the level of frictional shear stress that exists along the fiber-matrix interface during fatigue. Since this technique allows confirmation of other techniques for estimating frictional shear stress (e.g., fiber pushout technique developed by Marshall at Rockwell Science Center). Moreover, it is the only approach that allows determination of the in-situ change in frictional shear stress during cyclic loading (note that the level of frictional shear stress controls many mechanical properties such as strength, toughness and mechanical damping as well as thermophysical properties such as thermal diffusivity). The analysis that was developed to estimate frictional shear stress can also be used to understand the relationship between composite microstructure and cyclic energy dissipation in fiber-reinforced ceramics. CATALYTIC SYNTHESIS OF SILICON CARBIDE PRECERAMIC POLYMERS: POLYCARBOSILANES
D. H. Berry Oct. 1992 5 p
(Contract DE-FG02-91ER-14173)
(DE93-008634; DOE/ER-14173/T1) Avail: CASI HC A01/MF A01

Polycarbosilanes are the most successful and widely studied class of polymer precursors for silicon carbide, but traditional methods for their synthesis are inefficient and nonselective. This project is focused on developing transition metal catalysts for the synthesis of polycarbosilanes and other preceramic polymers. In recent work, we have developed the first homogeneous transition metal catalysts for the dehydrogenative coupling of simple alkyl silanes to oligomeric and polymeric carbosilanes, H-(SiR2CR')2)n-SiR3. The coupling of alkylgermanes, however, yields the corresponding oligomeric poly(germanes) (Ge-Ge). Future work will help elucidate the mechanisms of these catalytic process, explore the use of hydrogen acceptors as reaction accelerators, and develop new and more active catalysts. DOE

EVALUATION OF POLYARYL ADHESIVES IN ELASTOMER-STAINLESS STEEL JOINTS
M. Miura, N. Carciello, T. Sugama, and L. E. Kukacka Oct. 1992 26 p
(Contract DE-AC02-76CH-00016)
(DE93-009794; BNL-48089) Avail: CASI HC A03/MF A01

Polyaryl thermoplastic adhesives (polyetheretherketone (PEEK), polyphenylene sulfide (PPS), polyphenylethersulfone (PES)) were evaluated for ability to bond elastomer to metal for use in geothermal environments. Strength of elastomer-to-metal joints adhesives blends (such as in drill pipe or casing protectors) were determined using peel tests. Parameters involved in making the joints were temperature, time, and atmosphere, in addition to type of adhesive. Physical chemical analyses have aided endeavors to determine the cause of adhesion failure in the joint: differential thermal analyses, thermal gravimetric analyses, infrared spectroscopy, and electron spectroscopy for chemical analysis. Tests showed that joints made of adhesive blends which contained greater than 50% PES survived simulated geothermal conditions (200 C, water vapor pressure 200 psi) for weeks without significant decrease in peel strength. Chemical components of the adhesive appear to be highly stable under the conditions required to make the joints and in subsequent exposure to the simulated geothermal environment. DOE

Gas permeability coefficients P for several gases (He. CO2, CH4, O2, N2) were measured at 25 C in a series of semicrystalline diblock copolymers of poly(ethylene)/ poly(ethylene-propylene) (E/EP). A simple model is presented describing the gas transport in these polymer systems. It predicts the permeability of a randomly oriented spherulitic diblock specimen from the permeabilities of the individual lamellar regions of the copolymer. Model predictions were in excellent agreement with the experimental data. The upper bound (lamellae aligned in parallel with respect to the permeation direction) and lower bound (series lamellar align models were calculated and compared to a limited amount of corresponding experimental data on oriented specimens. THERMAL CONTROL PAINTS ON LDEF: RESULTS OF M0003 SUB-EXPERIMENT 18 Technical Report
Christopher H. Jaggers, Michael J. Meshjishnek, and John M. Coggi 15 Jan. 1993 27 p
(Contract F04701-88-C-0089)
(AD-A263252; TR-93(3935)-3; SMC-TR-93-16) Avail: CASI HC A03/MF A01

Several thermal control paints were flown on LDEF, including the white paints Chemglaze A276, S13GLO, and YB-71, and the black paint D-111. The effects of low earth orbit, which include those induced by UV radiation and atomic oxygen, varied significantly with each paint and its location on LDEF. For example, samples of Chemglaze A276 located on the trailing edge of LDEF darkened significantly due to UV-induced degradation of the paint's binder, while leading-edge samples remained white but exhibited severe atomic oxygen erosion of the binder. Although the response of S13GLO to low earth orbit is much more complicated, it also exhibited greater darkening on trailing edge-samples compared to leading-edge samples. In contrast, YB-71 and D-111 remained relatively stable and showed minimal degradation. This report examines the performance of these paints as determined by changes in their optical and physical properties, including solar absorptance as well as surface chemical changes and changes in surface morphology. It also correlates the optical and physical property changes with the physical phenomena that occurred in these materials during the LDEF mission. DTIC

POLYMERIC MATERIALS FOR USE IN WET HYDROCHLORIC ACID ENVIRONMENTS
J. M. Williams Apr. 1993 28 p
(Contract W-7405-eng-36)
(DE93-010881; LA-12314-MS) Avail: CASI HC A03/MF A01

Of two major operations in plutonium reprocessing, polymeric materials are suitable for use in the wet acid train, but not in the high thermal chloride conversion zone, except in those areas not subjected to excessive heat. This report provides a literature review of available polymeric materials. The discussion is meant to be a guide for corrosion management in hydrochloric acid environments through proper selection from these polymeric materials. DOE

A STUDY OF THE CHEMICAL MECHANISM IN LUBRICATION
1993 17 p
(Contract DE-AI05-84ER-13230)
(DE93-012230; DOE/ER-13230/T2) Avail: CASI HC A03/MF A01

Boundary lubrication is receiving increased emphasis today, especially with respect to advanced materials. An attempt is made to develop an overall framework to guide developmental efforts. The chemical reaction between the material surface and the lubricant is complex; many reactions occur in parallel between the major elements and their oxides and the minor elements on the surface with lubricant, which usually contain N, O, S, and P compounds. Reaction rates are influenced by surface energy as influenced by rubbing. The reaction products could be inorganic in nature such as hydrides, nitrides; as well as organic in nature, such as organometallic polymers. These products can act as an effective lubricant as well as exhibiting neutral or detrimental effects on friction/wear. Good lubricating film should have strong adhesion to surface, good lateral bonding to form coherent films, and high shear resistance. Detrimental products usually have high corrosivity such as organic acids, weak surface adhesion, and incoherent film structure. DOE

EFFECT OF METALLIC-COATING PROPERTIES ON THE TRIBOLOGY OF COATED AND OIL-LUBRICATED CERAMICS
O. O. Ajayi, A. Erdemir, G. R. Fenske, R. A. Erck, J. H. Hsieh, and F. A. Nichols Sep. 1992 18 p Presented at the Annual Conference and Exhibition of the Society of Tribologists and Lubrication Engineers, Calgary (Canada), 17-20 May 1993
(Contract W-31-109-eng-38)
(DE93-010663; ANL/MCT/CP-77794; CONF-930513-1) Avail: CASI HC A03/MF A01

Friction and wear behavior was determined for zirconia ceramics lubricated with solid coatings (Ag, Au, and Nb) deposited by ion-beam-assisted-deposition (IBAD) techniques, and a polyol-ester-based synthetic oil. Although the use of soft Ag and Au coatings as solid lubricants in conjunction with the synthetic oil significantly reduced the friction and wear under boundary lubrication at temperatures up to 250 C, these films had poor durability. In contrast, the Nb coating was more durable (in terms of chemical reactivity and adhesion during the tribo-tests) than were the Ag or Au films. However, the friction and wear behavior of the Nb-coated zirconia was poorer than that of the ceramics coated with Ag or Au. DOE

ION-BEAM-ASSISTED DEPOSITION OF WEAR-RESISTANT COATINGS
B. D. Sartwell 1993 10 p
(Contract DE-AI02-88CE-90024)
(DE93-011529; DOE/CE-90024/11) Avail: CASI HC A02/MF A01

The adhesion strength and failure modes of ion-beam-assisted deposition (IBAD) TiN coatings were examined using a Revetest acoustic emission scratch tester. It was found that the adhesion strength which is represented as a critical normal load and failure modes of coated system are influenced by coating thickness, coating and substrate material properties, and ratio of incident argon ions to titanium atoms. The critical load increased with increasing substrate hardness. For coatings of thicknesses 0.5, 2.0, and 5.0 micrometers and with R = 0.4, the highest critical load was obtained for the intermediate thickness coating. For coatings of thickness 2 micrometers and with R values of 0.1, 0.4, and 0.7, the highest critical loads were correlated with the spallation of the coating. Further, the change in slope of the coefficient of friction of the diamond stylus sliding on the coated system could be correlated with the removal of the coating from the scratch track. A hot stage for high temperature wear tests on the Revetest apparatus was completed and tests were initiated. DOE

The morphological evolution of cylindrical pores or 'channels' and crack-like cavities in glass and glass-containing ceramics at elevated temperatures was studied. The systems studied were: Corning 7056 alkali borosilicate glass, soda-lime glass (microscope slides), a commercially available 96% Al2O3 with approximately 5-10% intergranular glass, 96% Al2O3 bonded to sapphire, and a model sapphire/glass/sapphire system fabricated by diffusion bonding etched and unetched pieces of sapphire onto which 30-50 nm of SiO2 had been sputter deposited. These systems span a broad range of glass contents, and permit observation of healing behavior with varying glass content. The results were compared with analytical models and results of similar studies in completely crystalline systems. DOE

ACID SOLUTION ABSORPTION OF EXTRUDED POLYETHYLENE FOAM
E. A. Kyser Jan. 1993 12 p
(Contract DE-AC09-89SR-18035)
(DE93-011701; WSRC-TR-93-011) Avail: CASI HC A03/MF A01

Water and acid absorption tests of samples of a proposed replacement to current polyethylene foam used as fill material on the FB-Line cation columns have been completed. Water and nitric acid solution absorption of up to 4 volume percent was observed over approximately a 4 month period of time. Because of the nuclear safety implications, liquid absorption of a replacement fill material must be low. Ethafoam (trademark) 220 extruded polyethylene, a product available from Dow Chemical Company appears to be a good candidate material for replacement of the existing fill material. Establishment of 5 volume percent solution absorption specification appears to be both reasonable and achievable for a replacement foam. DOE

THERMODYNAMICS OF SWELLING AND COLLAPSE OF POLYELECTROLYTIC GELS Ph.D. Thesis [ZUR THERMODYNAMIK DES SCHWELLENS UND SCHRUMPFENS POLYELEKTROLYTISCHER GELE]

Roland Rydzewski Feb. 1992 141 p In GERMAN
(ETN-93-93485) Avail: CASI HC A07/MF A02

The equilibrium of a polyelectrolytic gel with an electrolyte solution is mathematically described with particular consideration given to unsteadiness occurring in gel state transformation by stationary evolution of electrolyte solution composition. Equilibruim was calculated by minimization of free energy of the gel-bath system. The mixture entropy was considered as that of low molecular, ideal solution. Free energies of interaction between polymer and solvent, of network elasticity, elastrostatic interaction between charge carriers and chemical reactions (pyrolysis), were included in the calculations which were numerically achieved by Newton iterations. Four gel-bath systems were examined, for which the following aspects were discussed: distribution equilibrium of solvent, different ion species and electrical charge between gel and bath, elastic and chemical equilibrium and interaction between them. The systems were: an acrylamid-sodium acrylate-copolymer gel in a sodium chloride solution, with the salt cation similar to the gel counter ion, the same system in which the gel is subjected to uniaxial compression-traction load, the same system, with salt cation different from gel counter ion, and a polyacid gel in sodium hydroxide whose neutralization is studied. US-Patent-Class-244-158R; US-Patent-Class-89-36.02;
Int-Patent-Class-B64D-7/00) Avail: US Patent and Trademark Office

A hypervelocity projectile shield which includes a hollow semi-flexible housing fabricated from a plastic like, or otherwise transparent membrane which is filled with a fluid (gas or liquid) is presented. The housing has a inlet valve, similar to that on a tire or basketball, to introduce an ablating fluid into the housing. The housing is attached by a Velcro mount or double-sided adhesive tape to the outside surface of a structure to be protected. The housings are arrayed in a side-by-side relationship for complete coverage of the surface to be protected. In use, when a hypervelocity projectile penetrates the outer wall of a housing it is broken up and then the projectile is ablated as it travels through the fluid, much like a meteorite 'burns up' as it enters the earth's atmosphere, and the housing is deflated. The deflated housing can be easily spotted for replacement, even from a distance. Replacement is then accomplished by simply pulling a deflated housing off the structure and installing a new housing. EFFECTS OF ATOMIC OXYGEN AND ULTRAVIOLET RADIATION ON CANDIDATE ELASTOMERIC MATERIALS FOR LONG DURATION MISSIONS. TEST SERIES NO.1

R. C. Linton, M. M. Finckenor, R. R. Kamenetzky, and P. Gray (Sverdrup Technology, Inc., Huntsville, AL.) Jun. 1993 21 p
(NASA-TM-108408; NAS 1.15:108408) Avail: CASI HC A03/MF A01

Research was conducted at MSFC on the behavior of elastomeric materials after exposure to simulated space environment. Silicone S383 and Viton V747 samples were exposed to thermal vacuum, ultraviolet radiation, and atomic oxygen and then evaluated for changes in material properties. Characterization of the elastomeric materials included weight, hardness, optical inspection under normal and black light, spectrofluorescence, solar absorptance and emittance, Fourier transform infrared spectroscopy, and permeability. These results indicate a degree of sensitivity to exposure and provided some evidence of UV and atomic oxygen synergism. Author (revised)

NOVEL POLYMER COMPOSITIONS FOR HIGH-TEMPERATURE MEMBRANE APPLICATIONS, PHASE 1 Final Technical Report

D. J. Brose, M. B. Chidlaw, D. T. Friesen, S. B. McCray, L. D. Nelson, R. J. Ray, and M. E. Schimpf 10 Dec. 1989 66 p
(Grant NSF ISI-88-60947)
(PB93-174126; NSF/ISI-89035-Phase-1) Avail: CASI HC A04/MF A01

The phase 1 program demonstrated the feasibility of using a group of robust polymers to fabricate membranes that are both temperature-resistant and chemically resistant. Whereas control membranes based on conventional polymers degraded at temperatures of 175 C, the robust membranes could withstand exposure to temperatures of 250 C without damage. They also have excellent chemical resistance and unique permselectivity characteristics that make them ideal for a wide variety of separation applications. In addition to fabricating and testing dense-film membranes, researchers were able to fabricate microporous and skinned asymmetric membranes from the robust polymers studied. NTIS

A TRANSIENT FGM INTERLAYER BASED APPROACH TO JOINING CERAMICS

A. M. Glaeser, M. L. Shalz, B. J. Dalgleish, and A. P. Tomsia Jan. 1993 17 p Presented at the 2nd International Symposium on Functionally Gradient Materials (FGM), San Francisco, CA, 1-4 Nov. 1992
(Contract DE-AC03-76SF-00098)
(DE93-010415; LBL-33407; CONF-9211218-1) Avail: CASI HC A03/MF A01

In most cases, functionally gradient materials have been designed to produce a desirable property gradient in a material or in a joint region. In this paper, the concept of a transient gradient structure is introduced. The function of the intentional property discontinuities in these multilayer interlayers is to facilitate processing of assemblies and materials combinations that would be difficult to process using conventional bonding approaches. Specifically, the methods make use of a thin or partial layer of a low melting point transient liquid phase to facilitate bonding via brazing, yet produce refractory joints. Several mechanisms for consuming the transient liquid former are outlined, and examples of interlayer designs that exploit these mechanisms are presented. Specific results from experiments joining alumina to alumina via Cu/Pt/Cu, Cu/Ni/Cu, Cu/Nb/Cu, and Sn/Nb/Sn interlayers are presented. DOE

THE DESIGN AND LIFETIME CALCULATION OF MHD GENERATOR WALLS BASED ON SUBCRITICAL CRACK GROWTH IN CERAMICS Ph.D. Thesis
Hubertus Renier Mari vanLierop 1992 157 p
(ISBN-90-9004009-9; ETN-93-93577) Avail: CASI HC A08/MF A02

The design and investigation of the material properties of a wall segment for a closed cycle Magnetohydrodynamic (MHD) generator are described. Because of the maximum size of the available ceramics, the wall of a large generator has to be segmented. Considering the electrical processes in the generator, ceramics should be used as inner materials. Considering the heat flux through the wall a thermal insulating material should be applied. All these considerations are combined in the design. It was found that the bolt in the designed wall segment was loaded with both bending and tensile stresses. Two kinds of diagnostics to measure the load on the bolt are presented. The diagnostics are a laser interferometer in combination with a dynamical model of the construction and a strain gauge measuring system. Models which describe certain aspects of the wall segment are described. These are concerned with: thermal and dynamical modeling of the wall segment; modeling of crack growth; and probabilistic lifetime calculation. An experimental test rig was built to perform the lifetime tests and it proved to be a reliable device to load the wall segment with both thermal and mechanical loads. ESA

SYNTHESIS AND POLYMERIZATION OF AZAETHYLENES AND AZA-1,3-DIENES Final Report, 15 Jan. 1990 - 14 Jan. 1993
H. K. Hall, Jr. 8 Apr. 1993 9 p
(Contract DAAL03-91-G-0032)
(AD-A263651; ARO-27440.6-CH) Avail: CASI HC A02/MF A01

The polymerization of compounds containing the C=N bond is investigated. Two families of monomers are synthesized, namely imines (azaethylenes) and aza-1,3-dienes. For the imines, electron-accepting substituents such as cyano and carbomethoxy increase the polymerizability of these monomers. Extremely electrophilic imines are not stable, but do polymerize. Among the azadienes, the ones with the N-CN functionality are the most appropriate for polymerization. Substituents increase the stability of these dienes, but on the other hand hinder their polymerization and an exact balance has to be found. DTIC

CHARACTERIZATION AND OPTIMIZATION OF A HOT AIR SOLDER-LEVELING SYSTEM
R. R. Penniston, Jr. and D. A. Stockdale Mar. 1993 10 p
(Contract DE-AC04-76DP-00613)
(DE93-010188; KCP-613-5164) Avail: CASI HC A02/MF A01

The characterization and optimization of a new Hot Air Sokkr-Leveling (HASL) System in the Printed Wiring Board Fabrication Area was initiated to reduce the variability and defects in printed wiring board solder coatings. This body of work continues to provide information on the mechanics of solder coating, and allows us to predict the required process adjustments based on board type and geometry. The previous HASL system contained several processes (flux, preheat, solder-coat, cooldown) within one piece of equipment. The new system physically separates these processes using in-line conveyors. Parameters affecting these processes were brainstormed and evaluated using the MaHo Perez-Wilson methodology (MPCpS). The critical parameters were identified and segregated according to individual process. Each process was characterized for materials used, machine settings, and their effect (potential and actual) on product. Due to the wide-ranging affect of the preheat and solder-leveling machine settings, the first decision made was to restrict the characterization to duplication of the coating obtained from the previous system. Adoption of the parameters used on the previous system allowed a reduction in the number of evaluations required to establish initial machine settings (solder pot dwell times, solder temperature, preheat temperature, etc.). Activities in-work include a formal statistical analysis of the solder-leveling capabilities, and completion of optimization activities. DOE

PROCEEDINGS OF THE 25TH EUROPEAN CONFERENCE ON THE APPLICATION OF POLAR DIELECTRICS TO CELEBRATE THE 25TH ANNIVERSARY OF THE DIELECTRIC SOCIETY, INCORPORATING THE 1ST INTERNATIONAL WORKSHOP ON INTEGRATED FERROELECTRICS Final Report
J. M. Herbert and R. W. Whatmore 1 Apr. 1993 348 p Meeting held in London, England, 12-15 Apr. 1992
(Contract N00014-92-J-1497)
(AD-A263427) Avail: CASI HC A15/MF A03

The second European Meeting on the Applications of Polar Dielectrics was held in April 1992 to celebrate the 25th Anniversary of the dielectric Society, recognizing the rising importance of thin films of ferroelectrics for a wide range of applications. The meeting also incorporated the 1st International Workshop on Integrated Ferroelectrics. To facilitate international participation, the meeting was held at Imperial College, London. Over 1-50 delegates registered for the meeting from 27 countries. Unfortunately, attendance from Eastern Europe was limited by the present economic and political problems. However, the generous financial support provided by our sponsors enable the organizers to assist the attendance of many from this region and to provide reduced attendance costs for students. Reflecting the current extent of interest in dielectric materials, 175 abstracts were submitted. Topics ranged from stable ceramics for microwave applications to organic crystals and polymers with high nonlinear electro-optical coefficients. About one sixth of the contributions were concerned with the preparation and properties of thin films, particularly those involving ferroelectric materials. DOE

HIGH PRESSURE STUDIES OF HYDRATED NAFION MEMBRANES: DIELECTRIC RELAXATION AND DEUTERON NMR Interim Technical Report, Mar. 1992 - Apr. 1993
M. G. McLin, M. C. Wintersgill, J. J. Fontanella, R. S. Chen, and J. P. Jayakody 16 Apr. 1993 16 p
(Contract N00014-93-WR-24016)
(AD-A263511; Rept-TR-1) Avail: CASI HC A03/MF A01

Audio frequency electrical conductivity/dielectric relaxation and nuclear magnetic resonance studies of Nafion-117 have been carried out at pressures up to 0.3 GPa (3 kbar). For some samples, the electrical conductivity exhibits dispersion typical of hopping conductivity in an amorphous material, sigma = sigma(sub o)omega(sub w). The values of m are sample dependent and vary from about 0.55 to 0.75. In addition, the values of m are not strongly pressure sensitive. At a given frequency, the electrical conductivity tends to decrease as pressure increases and yield activation volumes on the order of 5 to 10 cu. cm/mol. The activation volume determined from the NMR spin-lattice relaxation time measurements are also sample dependent. The data shown correspond to an activation volume of about 8.6 cu.cm/mol. DTIC

RESULTS OF A ROUND ROBIN TEST PROGRAM: COMPLEX MODULUS PROPERTIES OF A POLYMERIC DAMPING MATERIAL Final Report, Oct. 1986 - May 1992

David I. Jones May 1992 315 p
(AF Proj. 2401)
(AD-A263619; WL-TR-92-3104) Avail: CASI HC A14/MF A03

This report describes the results of a Round Robin test program to evaluate the complex modulus behavior of a typical polymeric damping material, as measured by several different test methods and organizations. The results are analyzed in several different ways, namely wicket plot analysis, temperature by temperature plots of moduli and loss factors versus frequency, and frequency-temperature reduced variables master plots. It is determined that all the test methods used are capable of producing accurate results, but that conditions arise in each case where erroneous results are encountered. These conditions represent extreme values of the specimen stiffness (high or low), system frequencies, (usually high) or situations where small differences between large numbers occur. These conditions define natural limits for each test method and specimen configuration and dimensions. The identification of these limits, and the role of specimen dimension choices in defining the limit boundaries will be invaluable for future testing by each of the test methods and systems examined. DTIC

BORON CARBIDE ALUMINUM CERMETS FOR EXTERNAL PRESSURE HOUSING APPLICATIONS Final Report, FY 1991
J. D. Stachiw, A. Pyzik, D. Carroll, A. Prunier, and T. Allen Sep. 1992 168 p
(AD-A262749; NCCOSC/RDT/E/TR-1574) Avail: CASI HC A08/MF A02

B4C/Al ceramic composites have been found to be excellent candidates for pressure housing applications for use in deep submergence underwater vehicles. These materials have the compressive strengths of a ceramic material but a lower weight/displacement ratio and can be produced in near-net shape. A methodology has been developed in the Dow Chemical Company to form large parts of this material. Nine B4C/Al cylinders with 6-inch diameters and lengths of up to 9 inches were produced in the first phase of the program for development of pressure housing for underwater vehicles. The pressure housing tests showed that the compressive strength of this material in the form of 6-inch diameter by 5-inch-long cylinders was in excess of 300 kpsi. The weight to displacement of cylinders equipped with titanium joint rings for 9000-psi service with safety factor of 2.2 was found to be 0.365, a 27-percent improvement over alumina cylinders with identical dimensions and safety factors. When B4C/Al cylinders are compared to titanium alloy Ti6Al4Va cylinders for 9000-psi service with identical safety factor, the titanium cylinders are found to be 256 percent heavier. DTIC

DIPOLAR ORIENTATIONAL RELAXATION IN GUEST/HOST AMORPHOUS POLYMER PROBED BY SECOND HARMONIC GENERATION
T. Goodson, III and C. H. Wang 1993 21 p
(Grant NSF DMR-91-12993)
(AD-A262006; TR-20) Avail: CASI HC A03/MF A01

The decay of the second harmonic signal of a nonlinear optical chromophore dispersed in an amorphous polymer matrix is investigated. The decay curve can be fit either to the Kohrausch-Williams-Watts (KWW) stretched exponential function or to a bi-exponential function. The bi-exponential fit gives a better description of the decay of the second order nonlinear optical susceptibility of the contact electrode poled amorphous NLO polymer film. The fast decay component of the relaxation curve is attributed to the combined effect of reorientation of NLO dipole and the third order optical nonlinearity. The slow decay is due to the rotational diffusion of the NLO dipole. The temperature dependence of the rotational relaxation time is found to follow the Vogel-Fulcher-Tamman equation. DTIC

ISOTHERMAL ANNEALING AND RELAXATION OF THE SECOND HARMONIC GENERATION SIGNAL FROM A NONLINEAR OPTICAL POLYMER
H. W. Guan, S. H. Gu, and C. H. Wang 1993 11 p
(Grant NSF DMR-91-12993)
(AD-A262007; TR-21) Avail: CASI HC A03/MF A01

Results of the first detailed study of the effect of isothermal annealing on the relaxation behavior of the second harmonic generation signal below T(sub g) of nonlinear optical (NLO) polymers are presented. Lengthening of the NLO chromophore relaxation time by isothermal poling suggests a strategy for preparing a stable NLO material. DTIC

FLAME OR PLASMA SYNTHESIS OF DIAMOND UNDER TURBULENT AND TRANSITION FLOW CONDITIONS Patent
Keith A. Snail, inventor (to Navy) 29 Dec. 1992 16 p Filed 24 Sep. 1990
(AD-D015689; US-Patent-5,174,983; US-Patent-Appl-SN-587328; US-Patent-Class-423-446) Avail: US Patent and Trademark Office

A method for synthesizing diamond which comprises flowing together a gaseous carbon source and a gaseous hydrogen source to form an at least partially turbulent mixture. The at least partially turbulent mixture is excited to form an at least partially turbulent reactive species which is reacted to form a deposition species. A substrate is disposed in the deposition species while maintaining the substrate at a temperature for the deposition of diamond, thereby, inducing deposition of diamond on the substrate. DTIC

POLYMERS WITH ELECTRICAL AND NONLINEAR OPTICAL PROPERTIES Patent
John Stenger-Smith, inventor (to Navy) 10 Nov. 1992 5 p Filed 9 Apr. 1991
(AD-D015691; US-Patent-5,162,470; US-Patent-Appl-SN-682169; US-Patent-Class-526-256) Avail: US Patent and Trademark Office

Conjugated stilbenylene polymers are disclosed having nonlinear optical properties, and which can be converted to electrically conductive polymers. Such polymers are produced by reacting a biscycloalkylene sulfonium salt of 2,5-dimethyl stilbene, e.g., 2,5-(4'-methoxy)-stilbene dimethylene bis-(tetramethylene sulfonium bromide), with alkali metal hydroxide to form a cycloalkylene sulfonium salt precursor polymer, and then heating the precursor polymer under conditions to produce the stilbenylene vinylene polymer, e.g., poly(2,5-(4'-methoxy) stilbenylene vinylene). CRYSTALLIZATION OF NANOCOMPOSITE GLASSES MADE BY THE SSG PROCESS Final Technical Report, 15 Nov. 1991 - 31 Dec. 1992
Rustum Roy and Sridhar Komarneni 12 Jan. 1993 65 p
(Grant AF-AFOSR-0446-89)
(AD-A262892; AFOSR-93-0177TR) Avail: CASI HC A04/MF A01

The two main objectives of this research were: (1) to crystallize nanocomposite glasses through solid-state epitaxy, and (2) to demonstrate the critical role of epitaxy in crystallization by fabricating sol-gel films on single crystal substrates of a particular orientation. During the last three years we have been able to achieve both these goals using several compositional systems. We have been able to crystallize through seeding albite (NaAlSi3O8) glass which has been considered to be impossible to crystallize. Orthoclase (KAlSi3O8) which is extremely difficult to crystallize has also been crystallized using a compositionally multiphasic gel and crystalline seeds of KA1Si3O8, NaAlSi3O8, CaAl2Si2O8 and SrAl2Si2O8 feldspars. Monoclinic BaAl2Si2O8 has been crystallized at significantly lower temperatures by seeding with monoclinic BaAl2Si2O8 or SrAl2Si2O8 seeds. The effect of seeding has been minor or could not be detected in other glass systems such as Li2O-Al203-SiO2, Rb2O-Al2O3-SiO2 and Cs2O-Al2O3-SiO2. Little or no effect of seeding was found in non-oxide glasses such as silicon oxycarbide glasses. The role of epitaxy in crystallization has been demonstrated convincingly by making dense, epitaxial SrTiO3 and TiO2 thin films on single crystals of SrTiO3 and TiO2 of a particular orientation. The nanocomposite approach which has been discovered and developed through AFOSR support to us is now a well established practice. DTIC

AN EXTENSION OF A KINETIC THEORY OF POLYMER CRYSTALLIZATION THROUGH THE EXCLUSION OF NEGATIVE BARRIERS Technical Report No. 27, 1 Jun. 1992 - 31 Mar. 1993
Jerry I. Scheinbeim, Louis Petrone, and Brian A. Newman May 1993 54 p
(Contract N00014-91-J-1078)
(AD-A264810) Avail: CASI HC A04/MF A01

The simplest version of the Lauritzen-Hoffman (LH) model of polymer crystallization, which applies to infinitely long model polymer molecules crystallizing on an existing substrate of infinite width, is reexamined. The mathematical expressions for the model free energy barriers are observed to take on negative values at high supercooling. Since such negative barriers appear to be physically unrealizable for the crystallization process, the LH model is extended by imposing a mathematical constraint on the expressions for the barriers, to forbid them from ever being negative. The extended model contains one parameter gamma which varies from 0 to 1 and is analogous to the parameter psi of the LH model. For all values of gamma less than 1, the extended model predicts a finite lamellar thickness at every supercooling; moreover, this thickness at large undercooling, decreases monotonically with increasing undercooling, in agreement with experiment but in marked contrast to the LH model which exhibits the well-known delta l catastrophe. The relative insensitivity of the calculated lamellar thicknesses to the parameter delta supports the use of gamma = 0 as a first approximation for mathematical convenience in practice. DTIC

MICROWAVE PROCESSING OF SILICON NITRIDE FOR ADVANCED GAS TURBINE APPLICATIONS
T. N. Tiegs and J. O. Kiggans 1993 6 p Presented at the 38th ASME International Gas Turbine and Aeroengine Congress and Exhibition, Cincinnati, OH, 24-27 May 1993
(Contract DE-AC05-84OR-21400)
(DE93-007910; CONF-930502-4) Avail: CASI HC A02/MF A01

Results from previous studies on microwave processing of silicon nitride-based ceramics are reviewed to ascertain the application of this technology to advanced gas turbine (AGT) materials. Areas of microwave processing that have been examined in the past are (1) sintering of powder compacts; (2) heat treatment of dense materials; and (3) nitridation of Si for reaction bonded silicon nitride. The sintering of Si3N4 powder compacts showed improved densification and enhanced grain growth. However, the high additive levels required to produce crack-free parts generally limit these materials to low temperature applications. Improved high-temperature creep resistance was observed for microwave heat-treated materials and therefore has application to materials used in highly demanding service conditions. In contrast to Si3N4, Si couples well in the microwave and sintered reaction-bonded silicon nitride materials were fabricated in a one-step process with cost-effective raw materials. However, these materials are also limited to lower temperature applications, under about 1000 C. DOE

PROPERTIES OF SUPERCONDUCTING YBa2Cu3O(6+4) CERAMIC MATERIALS: EFFECT OF PROCESSING PARAMETERS
A. S. Rao Mar. 1993 37 p
(AD-A263441; CARDEROCKDIV-SSM-61-93/04) Avail: CASI HC A03/MF A01

The effect of the sintering temperature, the sintering time and the addition of 5 wt. % silver on the average particle size, bulk density, and the superconducting zero resistance temperature (Tc) YBa2Cu3O(6+x) ceramic materials was investigated in the range 880 - 940 C for 2 hours and at 920 C for different times in the range 0-10 hours. The results suggest that while the density and particle size of the sintered ceramic increases with an increase of the sintering temperature (and 2 hours of sintering), prolonged sintering (at 9200 C) above 4 hours of duration does not improve above properties. However, the superconducting zero resistance temperature (Tc) does not change significantly. In the presence of 5 wt. % silver, it appears that both sintering temperature and duration of sintering significantly improves the bulk density, particle size, and (Tc) of YBa2Cu3O(6+x). DTIC

CHROMATOGRAPHIC AND SOLVATOCHROMIC MEASUREMENTS ON BUTYL RUBBERS Final Report
Michael H. Abraham and Chau M. Du Jan. 1993 36 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DAJA45-91-C-0022)
(AD-A263088) Avail: CASI HC A03

The aim of the present work is to characterize polymers in terms of polymer-solute interactions, and hence to understand solubility properties of the polymers concerned. Sorption, desorption and partition are all important processes that could be better understood with such knowledge of solubility-related interactions. The two main methods used in this work to characterize polymers are the solvatochromic method, described in the Third Interim Report, and the method of multiple linear regression analysis (MLRA) based on linear solvation energy relationship (LSER). It is this latter method that will be described here. DTIC

SYNTHESIS AND PROPERTIES OF A CATION-CONDUCTING, HIGH TEMPERATURE POLYMER ELECTROLYTE Interim Technical Report, Mar. 1992 - Apr. 1993
Y. Okamoto, Z. S. Xu, M. G. McLin, J. J. Fontanella, and Y. S. Pak 16 Apr. 1993 16 p
(Contract N00014-93-WR-24016)
(AD-A263557; TR-2) Avail: CASI HC A03/MF A01

A new class of polymer electrolyte, high temperature polymer electrolytes, as an electrolyte in high discharge rate batteries is proposed. As an initial effort in the development of these materials, sodium and lithium salts of sulfonated poly(p- phenyleneterephtalamide) have been prepared. DSC and electrical conductivity studies have been performed on these films. The conductivity exhibits Arrhenius behavior over the temperature range in which they are thermally stable (180-240 C) with the material containing sodium being more conductive than those containing lithium. Although the electrical performance of these materials is inadequate from a practical standpoint, it is suggested that with additional development these materials could function as electrolytes for high discharge rate batteries. THE EFFECT OF OXIDATION EMBRITTLEMENT ON THE IMPACT BEHAVIOR OF NICALON REINFORCED CAS 2 CERAMIC MATRIX COMPOSITES
L. A. Gish and D. F. Hasson Apr. 1993 26 p
(Contract N00014-93-WR-24019)
(AD-A263567; USNA-EW-05-93) Avail: CASI HC A03/MF A01

The impact behavior of Nicalon reinforced CAS 2 composites is described. Impact tests of samples loaded to 1.0 microcracking yield and heated to 600 deg C for 10 hours were compared to tests of as received samples to determine the degree of degradation caused by the treatment. In addition, samples which were loaded to 1.0 micro-cracking yield but not heated and samples which were heated to 600 deg C for 10 hours were compared to isolate the effects of pre-cracking and heating. It was demonstrated that oxidation embrittlement has a negative effect on the maximum stress and dynamic fracture toughness of CAS II composites when fractured in impact. It was further demonstrated that specimens reinforced with mica-coated Nicalon fibers are more susceptible to oxidation embrittlement than specimens reinforced with standard Nicalon fibers. DTIC

(Contract DAAL03-90-G-0023)
(AD-A263737; ARO-27037.6-MS) Avail: CASI HC A01/MF A01

We have used the positron as a microscopic probe to clarify the connection between the microscopic properties (e.g., free volume distributions) and macroscopic properties (pressure, volume, and temperature relations) of polymers in the glassy state. Measurements of the positron lifetime distribution in the polymer as a function of temperature, aging, and applied strain have shown that positrons are sensitive to the distribution of free volume elements. However, we have also found that refinements in data analysis are necessary, and that we are far from obtaining an unambiguous free-volume distribution from the current results. Theoretical models are being tested to see if they are consistent with the results. We have also generated simulated positron lifetime distributions to test the validity of our curve-fitting methods, and we have discovered that these methods break down when the instrumental resolution curve exceeds approximately 250 nanoseconds, in width. A mechanical testing program was developed for evaluation of the weakening effects of different types of commonly encountered flaws on the strength of composite boat hulls. A specification was developed for production of test coupons containing realistic and consistently reproducible simulated defects. Tensile and flexural testing procedures were specified, including development of a technique for tensile testing of cored specimens. A statistically-based test plan was developed. A mechanical testing program was conducted in which approximately 400 specimens were subjected to either tensile or flexural testing. This program was conducted to verify specimen production techniques, to validate mechanical testing procedures, and to acquire information about the statistical variability of test results, which is necessary for planning future experiments. The data from the testing also supported a limited number of conclusions about the effects of defects on the strength of composite specimens of solid, balsa-cored, and plastic foam-cored construction. DTIC

APPLICATIONS OF LASER LIGHT SCATTERING IN POLYMER DILUTE SOLUTION CHARACTERIZATION Final Report
Marie K. Potts Feb. 1993 31 p
(AD-A263110; ARL-TR-85) Avail: CASI HC A03/MF A01

Dynamic light scattering (or photon correlation spectroscopy, PCS) can be used to determine the frequency distribution of the light scattered from polymer solutions. This distribution contains information about the dynamics of the system. Depending on the wavelength of radiation and the size of the polymer molecule, the translations and rotations of the entire molecule, or the motions of the monomers can be studied. This information, combined with static light scattering (the traditional Zimm Plot analysis), can yield a molecular weight distribution (MWD), z-average radius of gyration (R sub g), hydrodynamic radius (R sub h), translational diffusion coefficient (D sub t), and in some cases a rotational diffusion coefficient (D sub r). Dynamic light scattering (DLS) has been used extensively in the dilute solution regime to determine the type of information listed above, and the theories associated with the various phenomena are well defined. DLS can also be applied to the analyses of semi-dilute solutions and to study the dynamics of entangled systems (e.g., polymer melts or diffusion of polymer chains in a matrix), although the interpretation of this type of DLS is still speculative. This report will focus on the use of DLS to determine translational diffusion coefficients, and the combination of static and dynamic Light scattering to determine molecular weight distributions. DETERMINATION OF THE SPACE CHARGE DISTRIBUTION WITHIN AN e-IRRADIATED POLYMER USING THE PRESSURE WAVE PROPAGATION METHOD Ph.D. Thesis - Paris VI Univ. [APPLICATION DE LA METHODE DE L'ONDE DE PRESSION A L'ETUDE DE POLYMERES IRRADIES EN AMBIANCE SPATIALE]
Marie-Pierre Cals 1990 187 p In FRENCH
(ONERA-P-1990-4; ETN-93-92721) Avail: CASI HC A09/MF A02

In the framework of a study of Electro Static Discharges (ESD) on geostationary satellites, a report on the determination of the space charge distribution in e(-) irradiated polymers by the pressure wave propagation method is presented. A pressure pulse generated in the sample by a Nd-YAG pulsed laser is used as a virtual probe of the charge distribution. This method is a powerful tool for measuring space charge distributions in dielectric materials and studying their evolution. An experimental simulation of charging and discharging processes in e(-) irradiated Teflon, Kapton, or PET films is performed. The main results concern the following: charge injection at interface, charge transport in Kapton under high electric field stress, electron range in polymers, and ESD mechanisms. ESA

APPLICATIONS OF TRANSITION METAL COMPOUNDS IN THE PREPARATION OF USEFUL SILICON-CONTAINING CERAMICS
Dietmar Seyferth 20 Apr. 1993 11 p
(Contract N00014-91-J-1590)
(AD-A264028; TR-41) Avail: CASI HC A03/MF A01

There have been many studies of the reactions of organosilicon compounds with diverse transition metal complexes. The original impetus for this research activity was given by the discoveries that heterogeneous platinum and palladium catalysts and chloroplatinic acid were effective hydrosilylation catalysts. In the year that followed, many other transition metal complexes were found to catalyze the addition of silicon hydrides to organic multiple bonds. Also, transition metal complexes were found to catalyze other reactions of organosilicon compounds, such as the insertion of acetylenes and other unsaturated organic compounds into reactive Si-Si bonds and reactions of the Si-C bonds of strained cyclic organosilicon compounds. A different focus on silicon-transition metal chemistry was found in Aylett's preparation of H3Si-transition metal compounds. These were found to be effective precursors for transition metal silicides by chemical vapor deposition. This potentially useful application in materials processing led to further work by others on the synthesis of transition metal complexes containing metal-silicon bonds. DTIC

THE DRIVE TO COST-EFFECTIVE STRUCTURAL CERAMICS
R. B. Schulz (Department of Energy, Washington, DC.) and D. R. Johnson 1992 7 p Presented at the Annual Automotive Development Technology Contractors' Coordination Meeting, Dearborn, MI, 2-5 Nov. 1992
(Contract DE-AC05-84OR-21400)
(DE93-009722; CONF-9211101-6) Avail: CASI HC A02/MF A01

The Ceramic Technology Program, initiated to develop high-reliability ceramics for applications in advanced automotive heat engines, has broadened its emphasis to cost-effective ceramics for midterm engines as well as long-term advanced engines. The new direction in the program has resulted from the recognition that the high cost of ceramic components is limiting commercial development, even though the reliability of ceramics has been improved significantly. A comprehensive program was undertaken to reduce the cost of ceramic components by reducing the costs associated with powders, forming, densification, and machining processes. Program highlights include a new effort to develop a low-cost source of high-quality silicon nitride powder, recent progress in a program to improve the reliability of silicon nitride ceramics; a forming method called gelcasting; microwave-processed sintered reaction bonded silicon nitride; a low-cost, high-performance silicon carbide; and development of a continuous belt furnace for low-cost densification of silicon nitride. CHROMATE-FREE CORROSION RESISTANT CONVERSION COATINGS FOR ALUMINUM
R. G. Buchheit (Centaur Associates, Inc., Washington, DC.) and G. E. Stoner (Virginia Univ., Charlottesville.) 1993 4 p Presented at the 18th Department of Energy (DOE) Compatibility, Aging and Service Life Conference, Aiken, SC, 20-22 Apr. 1993
(Contract DE-AC04-76DP-00789)
(DE93-009835; SAND-93-0591C; CONF-9304103-1) Avail: CASI HC A01/MF A01

A method for generating chromate-free corrosion resistant coatings on aluminum alloys using a process procedurally similar to standard chromate conversion was developed. These coatings provide good corrosion resistance on 6061-T6 and 1100 A1 under salt spray testing conditions. The resistance of the new coating is comparable to that of chromate conversion coatings in four point probe tests, but higher when a mercury probe technique is used. Initial tests of paint adhesion, and under paint corrosion resistance are promising. Primary advantage of this new process is that no hazardous chemicals are used or produced during the coating operation. DOE

STUDY OF CODEPOSITION OF ALUMINUM-HAFFNIUM AND DEPOSITION OF YTTRIUM BY THE CEMENTATION TECHNIQUE: ELABORATION OF Ni-Cr-Al AND Ni-Cr-Al-Hf FELT MATERIALS Ph.D. Thesis - Orleans Univ., 1989 [ETUDE DU CODEPOT ALUMINIUM-HAFNIUM ET DU DEPOT D'YTTRIUM PAR VOIE THERMOCHIMIQUE: CONTRIBUTION A L'ELABORATION DE FEUTRES METALLIQUES NI-CR-AL ET NI-CR-AL-HF]
Guillaume Leprince Sep. 1990 203 p In FRENCH
(ONERA-NT-1990-9; ETN-93-93727) Avail: CASI HC A10/MF A03

A low pressure gas phase aluminizing technique, where the substrates are treated in the gas phase, over the pack, in a semi-open chamber maintained under reduced pressure, is reported. A stable halide, like aluminum fluoride, is always present in the condensed state in the chamber, and hence, the process is controlled by the metal activities in the pack, the total pressure, and the temperature. The conditions necessary to increase the gaseous transport rate are deduced from a gaseous diffusion model, which takes into account the knudsen diffusion contribution at the lower pressures, inside narrow cavities of complex shaped substrates or porous materials. Using this technique, aluminization of fibers 12 micrometers in diameter of 90 percent porosity, for Ni-20 percent Cr felts and the codeposition of aluminum + hafnium and deposition of ytrrium on the same base material, were performed. Cyclic oxidation tests were performed on these materials at 900, 1000, and 1100 C (lifetime greater than 1000 1 h cycles) whereas hafnium doped specimens resist as high as 1000 C for the same duration. WHISKER TOUGHENING OF CERAMIC MATERIALS: A REVIEW
M. Bengisu and T. O. Inal 1993 73 p Prepared in cooperation with New Mexico Inst. of Mining and Technology, Socorro, NM
(Contract W-7405-eng-36)
(DE93-011565; LA-SUB-93-11/2) Avail: CASI HC A04/MF A01

Whisker reinforcement of ceramic and glass materials leads to improved toughness along with other mechanical properties. The most significant toughening mechanisms in whisker reinforced ceramics are crack bridging, whisker pullout, and crack deflection, according to a large number of theoretical and experimental studies. Important parameters in whisker toughening are whisker volume fraction, pullout length, whisker strength, and whisker-matrix compatibility. Depending on the whisker-matrix combination selected, limitations may arise at high temperatures due to oxidation, chemical reaction, and creep. Nevertheless, improved mechanical properties and the relative ease in fabrication of whisker reinforced ceramics, compared to fiber reinforced ceramics, opens a wide range of application opportunities for this class of materials. METHYLHYDRIDOPOLYSILAZANE AND ITS PYROLYTIC CONVERSION TO Si3N4/SiC CERAMICS Technical Report No. 39
Neal R. Dando, Anthony J. Perrotta, Carsten Strohmann, and Regina M. Stewart 20 Apr. 1993 34 p
(Contract N00014-91-J-1590)
(AD-A264150) Avail: CASI HC A03/MF A01

The present report explores the use of liquid state nuclear magnetic resonance (NMR) spectroscopy for characterizing the methylhydridopolysilazane (MHPS) prepared by the Seyferth/Wiseman procedure and compares the structure of this polymer with other ceramic precursors derived from similar synthetic routes. X-ray diffraction, cross-polymerization (CP) and single-pulse magic angle spinning (MAS) solid state NMR spectroscopy were employed for characterizing temperature-induced short range bonding and phase evolution in MHPS precursors to SiC/Si3N4 ceramics. The molecular weight and methyl substitution of the preceramic polymers is shown to affect the ceramic yield and phase development of these polysilazanes during pyrolysis. Ceramic yields approaching 90% are observed in these systems. CPMAS-NMR is shown to be uniquely capable of identifying the hydrogen-rich environments and the onset of short range SiC and SiN phase development in these amorphous preceramic materials. DTIC

DEVELOPMENT OF ADHERENT CERAMIC COATINGS TO REDUCE CONTACT STRESS DAMAGE OF CERAMICS
S. F. Wayne, J. H. Selverian, and D. ONeil Nov. 1992 220 p Prepared for Oak Ridge National Lab., TN
(Contract DE-AC05-84OR-21400)
(DE93-012518; ORNL/Sub-89-95915/2) Avail: CASI HC A10/MF A03

Strongly adherent coatings were deposited on reaction bonded Si3N4 (RBSN), sintered SiC (SSC), and HIP'ed Si3N4 (HSN) and using a newly developed chemical vapor deposition (CVD) process. Performance of the coating was assessed by oxidation, strength and contact stress testing. A new method was developed to experimentally determine the strength and Weibull modulus of thin brittle films on ceramic substrates. A significant portion of the study was devoted to numerical modeling of the coatings in order to understand the contributions of residual stress as different coating materials and thicknesses were combined. Coating designs were further analyzed by simulating the crack growth behavior in multilayer films while accounting for the interface fracture mechanics. This work has shown that the Al2O3+ZrO2 composite coating developed in this program can provide resistance to oxidation and contact stress. Commercial application of the composite coating has been successfully demonstrated by use of the Al2O3+ZrO2 composite as a protective coating on a Si3N4 cutting tool. DOE

TRIPLET STATES AND OPTICAL ABSORPTIONS IN FINITE POLYENES AND CONJUGATED POLYMERS
David K. Campbell, J. T. Gammel, Hai-Qing Lin, and E. Y. Loh, Jr. Mar. 1993 22 p
(AD-A264552) Avail: CASI HC A03/MF A01

We study the nature of triplet states in correlated, quasi one dimensional bands, with emphasis on the half-filled case relevant to conducting polymers. To incorporate both electron-phonon and electron-electron interaction effects, we use a Peierls-extended Hubbard Hamiltonian, which we solve for finite systems via (numerically) exact diagonalization (Lanczos) techniques. We extend our results to polymers using both standard finite-size extrapolation techniques and a novel boundary condition averaging scheme. First, we examine the nature of the lowest triplet state, focusing on the crossover from the free electron picture of neutral soliton pairs to the strongly correlated limit of spin excitations. We then examine the optical absorption spectra corresponding to (allowed) triplet-triplet transitions; for this purpose it is important that our naval boundary condition averaging method maintains sharp gap-edge features with reducing spurious rapid frequency variations produced by the finite-size approximations to the band-to-band continuum. We compare our results to data on triplet transitions in finite polyenes and discuss possible additional experimental implications, including the interpretation of recent spin-dependent photomodulation (SDPM) experiments in both trans-(CH)x and non-degenerate ground state conjugated polymers. FUNDAMENTAL STUDIES OF THE MECHANICAL BEHAVIOR OF MICROELECTRONICS THIN FILM MATERIALS Final Report, 15 Nov. 1988 - 31 Dec. 1992
William D. Nix Apr. 1993 38 p
(Grant AF-AFOSR-0185-89)
(AD-A264334; AFOSR-93-0272TR) Avail: CASI HC A03/MF A01

This document represents a final technical report for AFOSR Grant No. 89-0185. The research program supported under this grant involved a fundamental study of the mechanical properties of microelectronic thin film materials. The focus of the work was on the microscopic processes that lead to stresses in microelectronic thin films and control the mechanical properties of these materials. Our work ranged from studies of interconnect metals, passivation glasses and heteroepitaxial thin film semiconductors. In previous reports we highlighted work done of the mechanical properties of passivation glasses and interconnect metals and the processes of failure of interconnect metals. In this final report we highlighted our work on misfit dislocation formation in heteroepitaxial thin films. The body of the report contains two reports of our work on misfit dislocations. Our overall understanding of misfit dislocations in Si-Ge layers is described in the first report. That report also describes our work on the effect of capping layers on the formation of misfit dislocations. The second report describes our in situ studies of the kinetics of formation of misfit dislocations in Si-Ge films. By measuring the change of substrates curvature as a function of time during annealing we were able to determine the way in which mobile threading dislocation density changes during the course of annealing. CONJUGATED SUBSTITUTED IONIC POLYACETYLENES
Alexandre Blumstein 5 May 1993 76 p
(Contract N00014-91-J-1920)
(AD-A264702) Avail: CASI HC A05/MF A01

A new method for polymerization of the acetylenic bond in 2-ethynyl-pyridine and its trimethylsilyl derivative is described. The acetylenic triple bond is activated by quaternization of the pyridine nitrogen by methyltrifluoro methane-sulfonate (triflate). The resulting N-methylethynyl pyzidinium triflate salts polymerize readily to the corresponding poly(N-methylethynyl pyridinium acetylene)triflates when treated with a nucleophilic initiator such as pyridine, or with a free radical initiator (AIBN). The product polymers are substituted ionic polyacetylenes of low DP with extensive backbone conjugation. Spectral data indicate that the conjugation in these systems is, by far, the highest observed for substituted polyacetylenes. DTIC

THERMAL CYCLER TEMPERATURE VARIATION AND ITS EFFECT ON THE POLYMERASE CHAIN REACTION
Doug E. Bader Mar. 1993 49 p
(AD-A264660; DRES-SR-583) Avail: CASI HC A03/MF A01

The source of variation in Polymerase Chain Reaction (PCR) amplification assays that were encountered periodically in our studies was investigated. Two approaches, namely, PCR/agarose gel analysis and thermal probe analysis, were used. PCR/agarose gel analysis demonstrated random variation in the quantity and quality of amplified product from well to well, both within and between trials. Several modifications to the procedure did not eliminate variability. Thermal probe analysis indicated significant well to well temperature viability among certain wells or groups of wells within trial ($p = 0.01$) and significant temperature viability among certain well positions from one trial to another ($p = 0.05$). Thermal probe analysis also indicated large differences between the programmed setpoint temperatures and the actual temperatures inside the tubes for all three PCR events at the beginning of the soak period and two of three PCR events at the end of the soak period. The data from this investigation and other studies leads to the conclusion that the source of variability in PCR amplification efficiency experienced is most likely due to the inherent inability of our thermal cycler to maintain consistent temperature homogeneity across the heating block during PCR amplification reactions. It is advisable that replicate samples from amplification be prepared since a particular well cannot be expected to provide consistent results from well to well within a trial or from one trial to the next. COLLOID AND INTERFACE CHEMISTRY ASPECTS OF CERAMICS Final Report, 1989 - 1992
Egon Matijevic 30 Apr. 1993 12 p
(Grant AF-AFOSR-0441-89)
(AD-A264685; AFOSR-93-0329TR) Avail: CASI HC A03/MF A01

The major goal of this project was to address the properties and interactions of fine powders of interest in ceramics. In order to arrive at quantitative conclusions and assure reproducibility of data, the first requirement was to have well defined dispersions consisting of uniform particles of different chemical compositions (simple or mixed) and in different shapes. Thus, one part of the program has dealt with the synthesis of such 'monodispersed' powders. Specifically, we have produced colloidal particles of different metals, metal oxides, and silicon nitride. In addition, internally mixed particles of stoichiometrically defined metal ratios (such as metal niobates) and of variable composition have been obtained. Finally, coated particles of inorganic cores covered with shells of either different inorganic compounds or of polymers were prepared. All these systems were characterized in terms of their bulk and surface properties. In the other part of the program, we studied, theoretically and experimentally, interactions between unlike particles (i.e., the stability of mixed dispersions), in order to evaluate compaction and sintering effects of such powders. The rate of heterocoagulation was followed in aqueous dispersion of different combinations of particles and the obtained data were compared with expected values based on different theoretical models. The significant discrepancies between the experimentally evaluated and calculated stability ratios could be reconciled, if the surface charge segregation was taken into account. DTIC

OPTICALLY SWITCHABLE CONDUCTIVE POLYMERS Final Report, 15 Jun. - 14 Dec. 1992
Timothy L. Rose and Allan B. Kon 11 Feb. 1993 158 p
(Contract F49620-92-C-0041)
(AD-A264751; AFOSR-93-0288TR) Avail: CASI HC A08/MF A02

The objectives of the project were to synthesize and characterize a polymer that could be switched to its conductive state by intramolecular electron transfer initiated by absorption of light. By covalently bonding the electron donating moiety to the polymer, the rate of switching should be fast and uniform giving it potential applications in optical processing devices. The initial polymer system selected was a polythiophene substituted at the 3 position with a diphenyliodonium salt. Photodissociation of diphenyliodonium chloride in physical contact with the polymer formed the highly oxidizing phenyliodonium radical cation which in turn oxidized the polythiophene backbone. Several approaches tried to synthesize the covalently bound substituted polythiophene were unsuccessful. Polymerization of 3-ferrocenylpyrrole, which also has potential photodoping properties, was also unsuccessful. DTIC

METHOD OF FABRICATING A ROCKET ENGINE COMBUSTION CHAMBER Patent Application
Richard R. Holmes, inventor (to NASA) (Rockwell International Corp., Huntsville, AL.), Timothy N. McKechnie, inventor (to NASA) (Rockwell International Corp., Huntsville, AL.), Christopher A. Power, inventor (to NASA) (Rockwell International Corp., Huntsville, AL.), Ronald L. Daniel, inventor (to NASA) (Rockwell International Corp., Huntsville, AL.), and Robert M. Saxelby, inventor (to NASA) (Rockwell International Corp., Huntsville, AL.) 27 Jan. 1993 13 p
(NASA-Case-MFS-28569-1; NAS 1.71:MFS-28569-1; US-Patent-Appl-SN-009908) Avail: CASI HC A03/MF A01

A process for making a combustion chamber for a rocket engine wherein a copper alloy in particle form is injected into a stream of heated carrier gas in plasma form which is then projected onto the inner surface of a hollow metal jacket having the configuration of a rocket engine combustion chamber is described. The particles are in the plasma stream for a sufficient length of time to heat the particles to a temperature such that the particles will flatten and adhere to previously deposited particles but will not spatter or vaporize. After a layer is formed, cooling channels are cut in the layer, than the channels are filled with a temporary filler and another layer of particles is deposited. NASA

CARBORANE-(SILANE OR SILOXANE)-UNSATURATED HYDROCARBON BASED THERMOSETTING POLYMERS Patent Application
Leslie J. Henderson, inventor (to Navy) and Teddy M. Keller, inventor (to Navy) 17 Dec. 1992 27 p
(AD-D015718; US-Patent-Appl-SN-991940; Navy-Case-74948) Avail: CASI HC A03/MF A01

This invention relates to a new class of inorganic-organic hybrid polymers that are formed from linear inorganic-organic hybrid polymers of varying molecular weight. These new high temperature oxidatively stable thermosetting polymers are formed from linear polymeric materials having repeat units that contain at least one alkynyl group for cross-linking purposes and at least one bis(silyl or siloxanyl)carboranyl group. These organoboron thermoset polymers contain an unsaturated cross-linked hydrocarbon moiety. DTIC

CHARACTERIZATION OF SLOW CHROMOPHORE REORIENTATION IN NONLINEAR OPTICAL POLYMERS BY TWO-DIMENSIONAL MAS NMR Technical Report No. 6, 1 Jun. 1992 - 31 May 1993
Sharon Taylor-Myers, James G. Nuzzo, and James F. Haw 14 May 1993 23 p
(AD-A264809) Avail: CASI HC A03/MF A01

Two-dimensional 15N MAS NMR spectrometry was used to characterize slow reorientation of the chromophore at temperatures well below T sub g in the prototypical nonlinear optical (NLO) polymer 10% 4-nitroaniline-15N2/poly(methyl methacrylate). Qualitative analysis of 2D contour plots obtained for various mixing times at 289 K suggests that significant reorientation takes place between 0 ms and 200-300 ms, and little or no further change occurs up to 2000 ms. Straightforward statistical arguments were used to devise a simple model for quantitative analysis of integrated peak intensities in 2D MAS spectra. This analysis demonstrates that the chromophore undergoes random isotropic reorientation at the longest mixing times used and permits a calculation of the fraction of oriented chromophore remaining at any intermediate mixing time. The data at 298 K are well fit by an exponential autocorrelation function with a time constant of 91 ms. Limited data obtained at 323 K demonstrate that the chromophore reorientation is thermally activated and permit a rough estimate of the activation energy. The methods reported here should be readily applied to the characterization of chromophore dynamics at moderately long time scales for a variety of NLO polymer materials. Author (DTIC)

ORGANOMETALLIC COMPOUNDS AND POLYMERS WITH SECOND AND THIRD ORDER NONLINEAR OPTICAL PROPERTIES Final Report, 1 Dec. 1989 - 30 Nov. 1992
Mark E. Thompson 6 May 1993 18 p
(Grant AF-AFOSR-0122-90)
(AD-A264774; AFOSR-93-0343TR) Avail: CASI HC A03/MF A01

The chemistry carried out with AFOSR support was aimed at exploring new materials with potentially interesting nonlinear optical properties. All of our work involved transition metal complexes. In these materials we can alter either the metal ion or the ligands independently. In this way it is possible to alter the electronic properties of a given complex without altering its molecular or solid-state structure. Second and third order NLO properties were investigated in these materials. Both molecular and bulk nonlinearities were examined as second order candidates, while only molecular nonlinearities were examined for the third order materials. Second order properties in coordination compounds were found to scale Sc approximately equal to Cr greater than or approximately equal to Fe greater than Co. Polar coordination polymers were prepared in which excellent polar order was found in the polyermic chains, however, the adjacent chains pack antiparallel in the crystal leading to no bulk second order activity. Group 4 organometallic complexes were examined for their third order properties. Here the order based on metal was found to be Ti greater than Zr greater than Hf. The nonlinearity is thought to arise from extended molecular orbitals. DTIC

THE ADHESION OF AgI MOLECULES TO GASEOUS METALLIC SILVER CLUSTER CATIONS Technical Report No. 1974
Clifton K. Fagerquist, Dilip K. Sensharma, Temer S. Ahmadi, and M. A. El-Sayed 6 May 1993 23 p
(Contract N00014-89-J-1350)
(AD-A264820) Avail: CASI HC A03/MF A01

The evaporative channels for the unimolecular dissociation of metastable Ag(X)I(Y)(+) (X = 5-25; Y = 0-4) clusters made by fast atom bombardment of silver foil in the presence of CH3I vapor are observed in the first field free region of a double focussing mass spectrometer. Three dominant neutral evaporative channels were found: Ag loss, Ag2 loss, and AgI loss. Only Ag12I3(+) is found to have an additional channel involving an (AgI)3 loss. Consistent with our previous studies of stable Ag(X)I(Y)(+) clusters, a structural formula of (Ag(X-Y)) + (AgI)(Y) was assumed where the metallic part of the cluster conforms to Jellium model predictions. In comparing the relative evaporative loss of AgI from these metastable clusters, the following were observed: (1) evidence for significant AgI-AgI interaction for clusters whose metallic part has a 1s(sup 2), 1P(sup 2), or 1s(sup 2),1p(sup 4) Jellium configuration; (2) a near constant fractional loss of AgI as the number of AgI units in the parent cluster increases for clusters whose metallic part has a closed main Jellium shell; (3) a relative increase in the fraction loss of AgI as the number of AgI molecules in the parent cluster increases for clusters with an open shell configuration for the metallic part. These observations are discussed in terms of evaporative loss of AgI from structures in which the AgI molecules solvate the metallic part of the cluster. It is proposed that the heat of AgI evaporation is greatly determined by dipole/induced-dipole interactions between the permanent dipole of AgI and the polarizable delocalized electron density of the metallic part of the cluster. ADHESION OF THICK FILM Au TO ALUMINA CERAMICS
G. C. Nelson, J. J. Stephens, and P. F. Hlava 1993 3 p Presented at the 18th Department of Energy (DOE) Compatibility, Aging and Service Life Conference, Aiken, SC, 20-22 Apr. 1993
(Contract DE-AC04-76DP-00789)
(DE93-009802; SAND-93-0335C; CONF-9304103-3) Avail: CASI HC A01/MF A01

Thick film Au metallizations are commonly used as conductors in hybrid microelectronics that operate at high frequencies. Discrete components are attached to these conductors with Pb/In solder. Intermetallic compounds form and grow in the solid state with time; AuIn2 is the primary compound formed in the Au-Pb/In system. A hybrid unit using this technology failed to consume all of the Au after being artificially aged and then subjected to normal thermal cycle and vibration testing. Postmortem analysis revealed that three capacitors had debonded. The failed parts were studied to determine the failure mechanism(s) and to define a parametric study to characterize the mechanisms that bond the Au thick film to the ceramic substrate. DOE

EFFECT OF LEAD ADDITION ON THE FORMATION OF SUPERCONDUCTING PHASES IN Bi-Sr-Ca-Cu-O CERAMICS M.S. Thesis [EFEITO DA ADICAO DE CHUMBO NA FORMACAO DE FASES SUPERCONDUTORAS EM CERAMICAS DE BI-SR-CA-CU-O]
A. E. Martinelli 1991 82 p In PORTUGESE
(DE93-606893; INIS-BR-2988) Avail: CASI HC A05/MF A01 (US Sales Only)

Superconducting ceramics with starting composition Bi(2-x)Pb-(x)Sr2Ca2Cu3O(y) (0.0 is less than or equal to x is less than or equal to 0.6) were prepared in order to investigate the effects of partial substitution of Pb for Bi and sintering time and atmosphere in the formation of superconducting phases. For all samples x-ray diffraction analyses were performed to estimate the amount of superconducting phases; superconductivity was analyzed by dc electrical resistance and ac magnetic susceptibility measurements. The main results show that: (1) the longer the sintering time (up to 168 h), the larger the volume fraction of superconducting phases with critical temperature (T(sub c)) greater than the temperature of nitrogen liquefaction; (2) by partially substituting Pb for Bi it is possible to restrain the formation of 2212 phase (T(sub c) = 80 K) and to enhance the amount of 2223 phase (T(sub c) = 105 K); and (3) a heat treatment under oxygen atmosphere before sintering enhances the formation of 2223 phase. DOE

THE EFFECT OF Bi2 O3 ON THE ELECTRICAL PROPERTIES OF Zr O2: 3 PERCENT Mg O CERAMIC SOLID ELECTROLYTES M.S. Thesis [EFEITO DA ADICAO DE OXIDO DE BISMUTO NAS PROPRIEDES ELETRICAS DE ELETROLITOS SOLIDOS DE ZIRCONIA: 3 PERCENT MAGNESIA]
I. C. Cosentino 1991 64 p In PORTUGESE
(DE93-607029; INIS-BR-2989) Avail: CASI HC A04/MF A01 (US Sales Only)

Three wt% MgO ceramic solid electrolytes were prepared to study the effect of Bi2O3 addition on densification and electrical conductivity. Microstructural characterization was done by x-ray diffractometry, scanning electron microscopy, and electron microprobe analyses. Electrical conductivity measurements were done by two probe dc techniques in the 400 C - 700 C temperature range. The results show that 5 wt% Bi2O3 addition improves densification: 93% TD and 98% TD specimens are obtained from zirconia stabilized by powder mixture and by coprecipitation of oxides, respectively. Moreover, electrical conductivity values are found to be two orders of magnitude higher for ZrO2: 3 wt% MgO with 5% Bi2O3. DOE

PROCESSING OF NOVEL NANOPARTICLE DISPERSION STRENGTHENED CERAMICS FOR IMPROVED MECHANICAL PERFORMANCE Annual Report No. 1
Helen M. Chan, Martin P. Harmer, and Gary A. Miller 14 Dec. 1992 106 p
(Contract N00014-92-J-1635)
(AD-A264191) Avail: CASI HC A06/MF A02

Nanocomposites have continued to show promise both as structural ceramic materials and as ideal systems in which to design multiphase microstructures. This report focuses on successful techniques for fabricating Al2O3/SiC nanocomposites, the strengthening obtained by the addition of sub-micron SiC particles to Al2O3, and the technological advantages of the nanocomposite. Some of the most significant conclusions of this work are as follows: (1) A technique has been developed to reproducibly fabricate fine-grained nanocomposites of Al2O3 containing 0.15 micrometer SiC particles. (2) It has been confirmed that nanocomposites of Al2O3 containing 5 vol% 0.15 micrometer SiC have exceptionally high unindented strengths. A subsequent annealing step improves these unindented strengths to greater than 1 GPa. (3) The strengthening effect appears to be grain size independent; the strengthening does not diminish even after the matrix grain size is coarsened to the level of 60 microns. This is in marked contrast to undoped Al2O3 in which the unindented strengths decrease significantly as the grain size coarsens. (3) The strengthening mechanism in the nanocomposite is believed to arise from machining-induced residual surface stresses. The function of the annealing step is to relax these stresses slightly (as indicated in preliminary x-ray stress measurements) while significantly decreasing the size of the machining flaws. DTIC

Ceramic materials are beginning to replace conventional materials in high temperature structural applications, but further advances are needed to improve their reliability. To analyze the complex behavior of ceramics, it is useful to consider the structure on four hierarchical levels--namely the molecular-, nano-, micro-, and macroscales. Interactions at and between these various levels of structure exert important and often quite specific influences. The research conducted for this effort involved using chemical approaches to synthesize and process ceramic powders to create and control these hierarchical structures in ceramic materials. With the development of chemical approaches for synthesizing and processing ceramics, it is possible to develop synthetic and processing methods to control the molecular and nanostructure of ceramic powders. This report describes our efforts to synthesize submicron SiC, TiB2, TiC, and TiN powders and nanocomposites from preceramic polymers. Efforts to synthesize epitaxial LiNbO3 films from alkoxide precursors are also described. DTIC

PHYSICAL CHEMICAL STUDIES ON MOLECULAR COMPOSITE COMPOSITIONS Final Report, 1 Jan. 1988 - 31 Jul. 1992
Guy C. Berry 20 Feb. 1993 99 p
(Grant AF-AFOSR-0206-89)
(AD-A264834; AFOSR-93-0206TR) Avail: CASI HC A05/MF A02

Research in three areas is described: nonlinear optical (NLO) properties of nematic solutions of PBT; the refractive indices of nematic solutions of

PBT; and the rheological properties of blends of PBT and nylon-66, or PBO and PabBO, where PBT is trans-poly(1,4-phenylene 2,6-benzobisthia-zole), PBO is cis-poly(1,4-phenylene 2,6-benzobisoxazole), PabBO is poly(2,5-benzoxazole), and nylon-66 is poly(hexamethylene adipamide). Fully aligned monodomains of nematic solutions of PBT were used in the first two parts. An unexpected NLO behavior was observed in which the maximum NLO third-harmonic generation did not occur with light polarized along the molecular axis of the rodlike PBT, even though the refractive index is maximum for that case-possible reasons for this behavior are discussed. The rheology of miscible blends of the rodlike chains with flexible or semiflexible chains is discussed using a model accounting for constraints on the rodlike dynamics imposed by the flexible or semiflexible components. It is shown that information from phase equilibria is essential to such an analysis, as the dynamic constraints are correlated with the factors that cause the formation of the nematic phase in such blends. (AD-A264837; AFOSR-93-0216TR) Avail: CASI HC A02/MF A01

A high yield synthetic scheme for poly(paraphenylene) starting from biologically produced cis-5,6-dihydroxy 1,3-cyclohexadiene was developed in which trimethylsiloxy groups on the diol precursor polymer are quantitatively transformed to ester functionalities for facile cis-pyrolytic elimination. The final pyrolysis step appears to be very sensitive to reaction conditions and additives, and can result in some degradation of the polymer backbone. The use of Lewis acid salts such as anhydrous zinc halides or Bronsted acids such as 3,4-dichlorobenzenesulfonic acid as aromatization catalysts was found to lower the aromatization temperature and prevent degradation. The Lewis acid salt catalysts afford dark colored, tough films while the Bronsted acid catalysts afford light colored, malleable foams. Polyphenylenevinylene was also prepared from cis-5,6-dihydroxy 1,3-cyclohexadiene through a precursor polymer route. DTIC

TENSILE CREEP BEHAVIOR OF POLYCRYSTALLINE ALUMINA FIBERS
H. M. Yun and J. C. Goldsby Jul. 1993 11 p
(RTOP 537-04-21)
(NASA-TM-106269; E-7995; NAS 1.15:106269) Avail: CASI HC A03/MF A01

Tensile creep studies were conducted on polycrystalline Nextel 610 and Fiber FP alumina fibers with grain sizes of 100 and 300 nm, respectively. Test conditions were temperatures from 800 to 1050 C and stresses from 60 to 1000 MPa. For both fibers, only a small primary creep portion occurred followed by steady-state creep. The stress exponents for steady-state creep of Nextel 610 and Fiber FP were found to be about 3 and 1, respectively. At lower temperatures, below 1000 C, the finer grained Nextel 610 had a much higher 0.2 percent creep strength for 100 hr than the Fiber FP; while at higher temperatures, Nextel 610 had a comparable creep strength to the Fiber FP. The stress and grain size dependencies suggest Nextel 610 and Fiber FP creep rates are due to grain boundary sliding controlled by interface reaction and Nabarro-Herring mechanisms, respectively. EXPLOSIVE CONSOLIDATION OF COMBUSTION SYNTHESIZED TiC AND TiB2: PRECURSOR MORPHOLOGY EFFECTS Final Report, 1 Oct. 1987 - 1 Oct. 1989

Laszlo J. Kecskes, Andrus Niiler, Thomas Kottke, Sharon H. Robinson, and Frederick B. Pierce Apr. 1993 41 p

(DA Proj. 1L1-61102-AH-43)

(AD-A263186; ARL-TR-107) Avail: CASI HC A03/MF A01

The combustion synthesis/dynamic consolidation (CS/DC) technique has been applied to titanium-carbon and titanium-boron mixture with different initial precursor carbon and boron powder morphologies. The evolution of the CS/DC product structure was investigated by analyzing and comparing the combustion synthesis products following three fabrication process steps: reacted loose powders, reacted green compacts, and reacted green compacts which were dynamically consolidated shortly after the synthesis. In all cases, the purity of the precursor carbon and boron powders was found to affect the products' residual porosity. However, the dependence of the resultant product grain morphology on the precursors' morphology was not as straightforward. Correlations between the respective product structures and possible reaction mechanisms are discussed. DTIC

SPECIFIC IMPULSE CALCULATIONS OF HIGH ENERGY DENSITY SOLID CRYOGENIC ROCKET PROPELLANTS. 1. ATOMS IN SOLID H2 Final Report, period ending Feb. 1993

Patrick G. Carrick Apr. 1993 63 p

(AD-A263208; PL-TR-93-3014) Avail: CASI HC A04/MF A01

Specific impulse calculations for a wide range of input concentrations are reported for atomic additives to solid hydrogen, combusted with liquid oxygen. These specific impulse values are presented in the form of 3D contour plots that reveal information about an entire region of interest. The output product species are also presented in this manner. These plots can be used to determine the optimum performance of any particular additive concentration and provide insight into how the performance level changes with concentration of the additive, temperature in the chamber, and exhaust product species. DEVELOPMENT OF ALTERNATIVE FUELS FROM COAL-DERIVED SYNGAS

D. M. Brown 19 May 1992 153 p

(Contract DE-AC22-91PC-90018)

(DE93-011629; DOE/PC-90018/T6) Avail: CASI HC A08/MF A02

The overall objectives of this program are to investigate potential technologies for the conversion of coal-derived synthesis gas to oxygenated fuels, hydrocarbon fuels, fuel intermediates, and octane enhancers; and to demonstrate the most promising technologies at DOE's LaPorte, Texas, Slurry Phase Alternative Fuels Development Unit (AFDU). BASF continues to have difficulties in scaling-up the new isobutanol synthesis catalyst developed in Air Products' laboratories. Investigations are proceeding, but the proposed operation at LaPorte in April is now postponed. DOE has accepted a proposal to demonstrate Liquid Phase Shift (LPS) chemistry at LaPorte as an alternative to isobutanol. There are two principal reasons for carrying out this run. First, following the extensive modifications at the site, operation on a relatively 'benign' system is needed before we start on Fischer-Tropsch technology in July. Second, use of shift catalyst in a slurry reactor will enable DOE's program on coal-based Fischer-Tropsch to encompass commercially available cobalt catalysts - up to now they have been limited to iron-based catalysts which have varying degrees of shift activity. In addition, DOE is supportive of continued fuel testing of LaPorte methanol - tests of MIOO at Detroit Diesel have been going particularly well. LPS offers the opportunity to produce methanol as the catalyst, in the absence of steam, is active for methanol synthesis. DOE

BENEFITS OF IN SITU PROPELLANT UTILIZATION FOR A MARS SAMPLE RETURN MISSION

Mary F. Wadel Jun. 1993 13 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; cosponsored by AIAA, SAE, ASME, ASEE

(RTOP 506-42-72)

(NASA-TM-106243; E-7926; NAS 1.15:106243; AIAA Paper 93-2244)

Avail: CASI HC A03/MF A01

Previous Mars rover sample return mission studies have shown a requirement for Titan 4 or STS Space Shuttle launch vehicles to complete a sample return from a single Mars site. These studies have either used terrestrial propellants or considered in situ production of methane and oxygen for the return portion of the mission. Using in situ propellants for the return vehicles reduces the Earth launch mass and allows for a smaller Earth launch vehicle, since the return propellant is not carried from Earth. Carbon monoxide and oxygen (CO/O2) and methane and oxygen (CH4/O2) were investigated as in situ propellants for a Mars sample return mission and the results were compared to a baseline study performed by the Jet Propulsion Laboratory using terrestrial propellants. Capability for increased sample return mass, use of an alternate launch vehicle, and an additional mini-rover as payload were included. CO/O2 and CH4/O2 were found to decrease the baseline Earth launch mass by 13.6 and 9.2 percent, respectively. This resulted in higher payload mass margins for the baseline Atlas 2AS launch vehicle. CO/O2 had the highest mass margin. And because of this, it was not only possible to increase the sample return mass and carry an additional mini-rover, but was also possible to use the smaller Atlas 2A launch vehicle. HIGH OCTANE ETHERS FROM SYNTHESIS GAS-DERIVED ALCOHOLS

K. Klier, R. G. Herman, M. A. Johansson, and O. C. Feeley Feb. 1993 20 p

(Contract DE-AC22-90PC-90044)

(DE93-012470; DOE/PC-90044/9) Avail: CASI HC A03/MF A01

The testing of strongly acidic catalysts for the conversion of a mixture of methanol and isobutanol to ethers and hydrocarbons was continued. Under standardized test conditions the catalysts tested this quarter were: phosphotungstic acid supported on zirconia (PW12/ZrO2), 'niobic acid' (Nb2O5 x H20), and an iron and manganese doped sulfate-modified zirconia (Fe/Mn/ZrO2/SO4(2-)). The overall activity of these catalysts followed the order of Fe/Mn/ZrO2/SO4(2-) is greater than PW12/ZrO2 is greater than Nb2O5 x H2O with the Fe/Mn/ZrO2/SO4(2-) catalyst approaching ZrO2/SO4 (2-) in both activity and selectivity for isobutene production. The effect of the presence of water on the reaction of methanol and isobutanol over ZrO2/SO4(2-) was determined to be insignificant. At 157 C and a feed of 2/1 molar ratio methanol/isobutanol, the production of isobutene was unaffected by the addition of 0.05 and 0.10 parts of water to the 2/1 alcohol feed. Surface areas have been determined for Fe/Mn/ZrO2/SO4(2-) niobic acid, and phosphotungstic acid on silica. After calcination, the surface area for Fe/Mn/ZrO2/SO4(2-) was found to be 83 M2/g. Niobic acid and phosphotungstic acid on silica (PW12/SiO2) were found to have surface areas of 118 and 218 sq m/g, respectively. H-1 NMR was used to determine if and how much 1-butene was present as a product when isobutanol is dehydrated over sulfate-modified zirconia. It was found to be present in small amounts, less than 3% of the product stream. DOE

A SIMPLE MODEL FOR EXPLOSIVES FORMULATION

T. Rivera 1993 5 p Presented at the 1993 MAES National Symposium

on Super Critical Water Oxidation on Energetic Materials, Long Beach, CA, Apr. 1993
(Contract W-7405-eng-36)
(DE93-010703; LA-UR-93-922; CONF-9304110-1) Avail: CASI HC A01/MF A01

A simple model based on surface chemistry is developed, based on simple concepts of contact angle, wetting, and spreading. Results of the modeling can be stated by two simplified rules of thumb: (1) A liquid will spread on the surface of a solid if the surface tension of the liquid is less than the surface free energy of the solid, and (2) The liquid having the surface tension nearest that of the solid will preferentially wet the surface of the solid. These two rules can then be used to define the parameters that constitute a process for formulating a plastic bonded explosive (PBX), which is a crystalline high-explosive material coated with a small amount of plastic polymeric material (the binder). The PBX then can be pressed to a high density, and machined to a specific shape. The pressed and machined explosive material can then be used in a physics experiment to study fundamental properties of either the explosive or some other material. DOE

SUPER CRITICAL WATER OXIDATION ON ENERGETIC MATERIALS
J. A. Sanchez 1993 13 p Presented at the 1993 MAES National Symposium on Super Critical Water Oxidation on Energetic Materials, Long Beach, CA, Apr. 1993
(Contract W-7405-eng-36)
(DE93-010704; LA-UR-93-921; CONF-9304110-2) Avail: CASI HC A03/MF A01

Supercritical water oxidation (SCWO) is an innovative process for the destruction of hazardous wastes that occurs above the critical temperature and pressure of water. In this paper we present results for the oxidation of simple organic wastes and the destruction of explosives. We have tested a 50 gal./day mobile tubular reactor using both acetone and hexane as surrogate aqueous wastes in reaction with excess oxygen. For acetone, our results indicate that the fuel and oxidant can be conveniently premixed before heating and the acetone effectively destroyed (greater than 99.999%). By contrast, hexane, and likely other insoluble flammable organics must be separately preheated to above the critical temperature of water to avoid detonation. With regards to the treatment of explosives, we have demonstrated detection-sensitivity-limited destruction (typically greater than 99.9%) of five explosives, HMX, RDX, TNT, NQ, and PETN, in a smaller scale SCWO reactor. Two alternative methods of increasing processing throughput for explosives, which have very low solubility in water at room temperature, were also investigated. They are the use of slurries and the SCWO postprocessing of the products of explosives hydrolyzed in low-temperature, basic solutions. DOE

ADVANCED THERMALLY-STABLE, COAL-DERIVED, JET FUELS PROGRAM: EXPERIMENT SYSTEM AND MODEL DEVELOPMENT Annual Report, Jul. 1991 - Sep. 1992
Elmer Klavetter, Steve Martin, Wayne Trott, Tim OHern, and Gerald Nelson Feb. 1993 93 p
(Contract MIPR-FY1455-91N-0638; AF Proj. 3048)
(AD-A262747; WL-TR-92-2105) Avail: CASI HC A05/MF A01

A program entitled 'Thermally-Stable Jet Fuels Development' was initiated in FY89 by the U.S. Air Force, Aero Propulsion and Power Directorate, working jointly with the Department of Energy, Pittsburgh Energy Technology Center. Thermal stability of aviation fuels is of concern because of the potential operation problems arising from fuel degradation under thermal stress conditions. Sandia National Laboratories has been conducting efforts to develop instrumentation for monitoring characteristics of jet fuel degradation and solids deposition and develop models of those mechanisms from the data acquired using that instrumentation. This report describes the instrumentation development, data acquisition, and model parameter determination. Analysis of solid deposits is also described. DTIC

THE EQUIVALENT FLAT NOSE DIAMETER OF HEMISPHERICAL NOSE CYLINDRICAL PROJECTILES FOR IMPACT INDUCED DETONATION OF ENERGETIC MATERIALS Final Technical Report, Sep. 1991 - 1992
James P. Billingsley and James M. Oliver Dec. 1992 39 p
(AD-A263244; AD-E951998; AMSMI/TR-RD-SS-92-11) Avail: CASI HC A03/MF A01

The analysis of explosive detonation via projectile impact is inherently complex because of the many variables which must be considered. One very important variable is the nose or tip shape of the projectile which contacts the bare unprotected planar surface of the energetic material. This report demonstrates that Hemispherical Nose (HN) projectiles (cylindrical, rods, or spheres) are equivalent to a much smaller Flat Nose (FN) surface. This equivalence is suggested by comparison with appropriate theory and a very limited amount of experimental data for two explosives (PBX-9404 and COMP-B). Author (DTIC)

THE XNOVAKTC RHEOLOGICAL MODEL Final Report, Nov. 1990 - Apr. 1991
Paul J. Conroy Mar. 1993 36 p
(DA Proj. 1L1-61102-AH-43)
(AD-A263298; ARL-MR-47) Avail: CASI HC A03/MF A01

The rheological model, which is incorporated in the NOVA family of interior ballistic codes (Gough 1974), of which XNOVAKTC is the latest version, is examined in detail. The assumptions which are made in this model are also examined in detail. These assumptions are linked to the availability of experimental data, which may be used to guide constitutive modeling. Both empirical as well as analytical/experimental models are presented to provide the required mathematical closure of the solid-phase model. Previous work in this constitutive modeling area is discussed. Interior ballistic simulations of realistic systems by XNOVAKTC are shown to predict values of intrinsic intergranular bed stress in excess of 100 MPa. However, available mixture stress vs. mixture density measurements have shown pronounced nonlinear behavior at values well below 100 MPa, which suggests that measurements are needed over a wider range of intrinsic stresses. DTIC

MICROSTRUCTURAL MODELING OF ELECTRICAL BREAKDOWN IN SOLID FUEL PROPELLANTS Final Report, 14 Aug. 1987 - 14 Oct. 1990
Ronal W. Larson, Paul D. Beale, John D. Curry, Fred Eriksen, and Michael Frisoni 23 Mar. 1993 33 p
(Contract DAAL03-87-C-0021)
(AD-A263466; EMA-90-R-51; ARO-24927.4-EGS) Avail: CASI HC A03/MF A01

The subject matter in this report is an analytical treatment of the microstructural aspects of Electrostatic Discharge (ESD) ignition of solid rocket motors. ESD hazards of the type described herein are now well known to the solid propellant industry. Since 1985, two accidents involving solid rocket motors have caused the loss of eight lives. These are now accepted to have been initiated by ESD, causing ESD to have become the leading safety hazard within the solid propellant industry. The report describes features of solid propellants that make them particularly susceptible to ESD. Primary emphasis was placed on microstructural modeling to better understand how to mitigate these hazards by understanding the details of the hazard. Attempts were made in this and a companion doctoral thesis to explain (among other things) effects of time (or frequency), propellant formulation, temperature, pressure, and relative humidity. This report explains, but is not intended as a final definitive explanation of, much of the experimental phenomena that is summarized herein. DTIC

NEW HYDROGEN TECHNOLOGIES
1992 29 p
(DE93-778353; NEI-FI-184) Avail: CASI HC A03/MF A01

An overview of the overall hydrogen system is presented. There are separate sections for production, distribution, transport, storage, and applications of hydrogen. The most important methods for hydrogen production are steam reformation of natural gas and electrolysis of water. Of the renewable energy options, production of hydrogen by electrolysis using electricity from wind turbines or by gasification of biomass were found to be the most economic for Finland. Direct use of this electricity or the production of liquid fuels from biomass will be competing alternatives. When hydrogen is produced in the solar belt or where there is cheap hydropower, it must be transported over long distances. The overall energy consumed for the transport is from 25 to 40 % of the initial available energy. Hydrogen storage can be divided into stationary and mobile types. The most economic, stationary, large scale hydrogen storage for both long and short periods is underground storage. When suitable sites are not available, then pressure vessels are the best for short period and liquid H2 for long period. Vehicle storage of hydrogen is by either metal hydrides or liquid H2. Hydrogen is a very versatile energy carrier. It can be used to produce heat directly in catalytic burners without flame, to produce electricity in fuel cells with high efficiency for use in vehicles or for peak power shaving, as a fuel component with conventional fuels to reduce emissions, as a way to store energy, and as a chemical reagent in reactions. COMBUSTION/EXPLOSION CHEMISTRY OF BULK MATERIALS
Thomas B. Brill *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 1-19 Sponsored by AFOSR and Air Force Avionics Lab. (For primary document see N93-30061 11-28)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Introduction of new explosive and propellant compounds presents an enormous challenge for persons responsible for performance and safety. Predictive modeling of the ignition, combustion, and explosion process will become an increasingly important contribution of the research arm of the combustion and explosives community. This is because good models can help guide the introduction of new materials into practice in the face of cost, safety, and environmental constraints. Trustworthy models require sound experimental parameters as input. Many of the required variables cannot be obtained during the combustion or explosion process and can only be obtained by simulations. Hence, new experimental methods that can establish chemical and physical details about ignition, combustion, and explosion in a relevant manner are in great demand. Microscale fast thermolysis techniques combined with time-resolved spectroscopy have finally advanced to the point where a direct connection can be made to the macroscale combustion/explosion domain of bulk materials. This connection was made by recognizing that the heterogeneous reaction zone that defines a burning surface is instantly simulated by a rapidly heated thin film of material. This simulation is made with SMATCH/FTIR spectroscopy where the dynamic mass and temperature change are simultaneously measured on a thin film heated at 100 - 350 C/sec. The Arrhenius constants calculated from these data predict the linear regression rate of the bulk material burning at the same temperature and pressure. In this way, fast thermolysis can simulate a burning surface. Chemical details about the burning surface that are obtained by these microscale fast thermolysis techniques are found to be correlated well with findings by others who have investigated the macroscale behavior of the bulk material. The chemical details are explained in viewgraph form. Author (revised)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The application of theoretical chemistry and detailed chemical kinetics modeling provides a powerful approach to the understanding of the processes occurring in the decomposition and combustion of energetic materials. Combined with experimental chemical kinetic and flame measurements, it is unraveling the complex chemistry that occurs during the various stages of propellant combustion. In particular, the gas phase thermochemistry and reaction pathways have been investigated theoretically using quantum chemical methods such as Bond-Additivity-Corrected Moeller-Plesset 4th order perturbation theory (BAC-MP4). This approach was used to determine accurate heats of formation and free energies for reaction intermediates of decomposition and combustion of nitramines. The BAC-MP4 method is also used to calculate reaction pathways involving these intermediates. Using a fluid dynamics model for heat and mass transport combined with detailed chemical kinetics modeling, this information can be used to develop a chemical model for nitramine combustion. Important issues regarding the chemical processes of nitramine decomposition, ignition, and combustion are discussed. Differences in decomposition mechanisms for the condensed phase and gas phase are identified. New theoretical chemistry approaches for investigating condensed phase reaction mechanisms are presented. These new methods are applied to nitromethane decomposition. Author (revised)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Both NO2 and HCN are early products of cyclic/polycyclic nitramine decomposition reactions. The kinetics and mechanism of the thermal reaction between these two important species are not yet understood. In this work, we have studied the thermal oxidation of HCN by NO2 at temperatures between 1500 and 2400 k, using a shock tube equipped with two stabilized cw CO lasers. One pair of reaction products, either CO and NO or CO and H2O, could be simultaneously monitored. Kinetic modeling was carried out for these products employing an improved mechanism, which incorporates several new processes involving HNC, the structural isomer of HCN, as well as many newly established reactions involving HNCO. The implications of HNC to the HCN-NO2 chemistry under the present shock tube conditions will be discussed in terms of the BAC-MP4 results. Author (revised)

THERMAL DECOMPOSITION OF NITRAMINES **c25**
James C. Oxley, R. Szekeres, and A. Kooh *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 53-54 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The thermal decomposition of a number of nitramines was examined in dilute solution. The nitramines examined included aliphatic mononitramines (dimethylnitramine (DMN), diethylnitramine (DEN), dipropylnitramine (DPN), and diisopropylnitramine (DIPN)), cyclic mononitramines (N-nitropiperidine (NPIP) and N-nitropyrrolidine (DP)), cyclic dinitramines (N-dinitropiperazine (pDNP), 1,3-dinitro- 1,3-diazacyclopentane (DNI), and 1,3-dinitro-1,3-diazacyclohexane (mDNP)), and nitramines of military interest RDX, HMX, CL20, and TNAZ. For the aliphatic and cyclic mono- and di-nitramines, the corresponding nitrosamines were the only or major condensed-phase product. For D-MN the products were completely characterized.

The instrument used in this study is a ZAB-2FQ three-stage, high-resolution mass spectrometer that is uniquely configured to study dissociation processes. The geometry of the major components of the instrument is shown. Selected ions may undergo dissociating collisions with gases or unimolecular reactions in the regions between the ion source and the magnet and/or between the magnet and the electric sector and/or in the first quadrupole of the dual quadrupole stage. The stage following each collision region analyzes the collision product ions or is used to isolate a selected ion for further collisions. The preferred method of ion formation is fast-atom bombardment (FAB). Using this method, ions are sputtered directly from the surface of crystalline ammonium dinitramide (ADN) by the application of a high-energy (6-7 keV) beam of xenon atoms. ADN crystals are pressed into soft indium metal for support and are inserted by a probe into the FAB ion source. The ions formed by sputtering are extracted from the ion source and accelerated at high voltage into the mass spectrometer. The four main areas of this work-in-progress are summarized.

OBSERVATION OF REACTION INTERMEDIATES IN CRYSTALLINE RDX **c25**
J. Michael McBride and John P. Toscano *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 71-84 (For primary document see N93-30061 11-28)
(Contract N00014-90-J-4015)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

We have studied low-temperature electron paramagnetic resonance (EPR) and Fourier-transform infrared (FTIR) spectra in single-crystal samples of RDX after photolysis at very low temperatures and with subsequent warming. Only a small fraction of the material was decomposed, probably less than 0.1 percent. The primary goal of this work was to establish reaction schemes for this energetic solid under conditions suitable for the kind of detailed spectroscopic investigation that can identify chemical intermediates and reveal the structure and mechanical properties of their surroundings. Knowledge of these intermediates, their spectral characteristics, and their reaction schemes should prove useful to those who use other techniques to study thermal or shock-induced decomposition of solid RDX.

NO2 UNIMOLECULAR DECOMPOSITION: STEP-LIKE VARIATION OF k(SUB uni)(E) **c25**
G. A. Brucker, S. I. Ionov, Y. Chen, and Curt Wittig *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 85-88 (For primary document see N93-30061 11-28)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The photoinitiated unimolecular reaction of NO2 is the only case in which a stable triatomic can be excited optically via an allowed one-photon transition to levels above the reaction threshold that have predominantly ground electronic state character. It is known that near-infrared, visible, and ultraviolet photons excite NO2 into a region of strong mixing between the (2)A1 ground state and the (2)B2 electronically excited state. Moreover, excitation between 250 and 398 nm results in NO2 decomposition to NO and O in their electronic ground states. Energies above reaction threshold, 25130.6/cm, are spectroscopically accessible over a broad, continuously tunable range, and NO is particularly amenable to sensitive, state-selective detection. Recent studies have successfully assigned NO2 vibrational levels of the ground electronic state up to 10,000/cm and the density of vibronic levels on the strongly coupled (2)A1 and (2)B2 electronic surfaces has been experimentally estimated in the region 16,500-18,500/cm. Moreover, spectra of extremely cold expansion-cooled samples have been taken in the region just below D(sub 0). Such data provide experimental assessments of level densities near D(sub 0) facilitating comparisons between theoretical predictions and measured reaction rates.

Thin-film samples of energetic material were used in the investigation of thermal decomposition chemistry under a variety of conditions. Decomposition was examined by utilizing the following: (1) confined samples of RDX or TATB maintained at an elevated temperature for up to 20 hours; (2) confined samples of RDX, HMX, TATB, HNS, or PCN heated at rates of 5-10 C/sec; and (3) pulsed laser heated (greater than 10 C/sec) RDX samples with no confinement. In the first two experiments, condensed-phase processes were examined using IR absorption spectroscopy (conventional IR and time-resolved infrared spectral photography). Observed products include H2O (consistently seen in heated nitramines), CH2O, and HCN. Gas-phase products of the rapidly heated RDX films were detected by time-of-flight mass spectrometry. Observed signals include clear signatures of decomposition products (m/z = 15 and m/z = 97) as well as ion masses arising from fragmentation of the parent molecule. In related experiments, the Velocity Interferometer System for Any Reflector (VISAR) was used to monitor reactive wave growth in energetic materials subjected to combined thermal and impact events. Sustained shocks were introduced into heated and confined samples of PBX 9502 and PBX 9404 using projectiles driven by a 63-mm-diameter light gas gun. Enhanced sensitivity to shock initiation was observed at sample temperatures as low as 140 C. The roles of elevated temperature, temperature-dependent sample density, and decomposition chemistry are discussed.

We present an overview of the present situation in France in the areas of Propulsion and Detonics. In each part, we begin with a short explanation of the French organization and of the research programs' targets. This is followed by the description of some recent results. Additionally, we provide information on future projects. The following topics are discussed: research into improved performance; economic considerations; and increased knowledge of the combustion or detonation mechanisms at the macroscopic and molecular levels. CHEMICAL DYNAMICS SIMULATIONS AS A PROBE TO THE INITIATION AND PROPAGATION OF CONDENSED PHASE DETONATIONS **c25**

Carter T. White, Daniel H. Robertson, Mark L. Elert (Naval Academy, Annapolis, MD.), and Donald W. Brenner *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 127-129 Sponsored by ONR (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

A detonation propagates through a solid explosive as a shock wave accompanied by a rapid rise in temperature, pressure, and density, which induce the exothermic chemical reactions that are necessary to sustain it. Because of the extremely short time and length scales involved, molecular dynamics simulations provide a potentially powerful probe of the interplay between shock waves and chemistry at the detonation front. This approach may also yield insight into the processes that lead to the onset of detonation as well as clarify the relationship between the discrete shock induced chemistry and those properties of solid explosives that can be understood based on continuum (hydrodynamic) theories. For these simulations to be at all convincing, however, a model must be devised that is sufficiently simple to treat condensed phase systems while incorporating traditional chemical concepts such as concerted reactions and energy release via the formation of strong chemical bonds. We have developed a model for a two-dimensional diatomic energetic molecular solid using Tersoff-type potentials that does have these essential ingredients. Simulations using this model display characteristics expected of a macroscopic detonation while exhibiting rich properties such as shock wave splitting which can be understood based on classical continuum concepts. Our results suggest the potential importance of dissociative transitions and rarefaction shock waves in understanding detonations. Author

VIBRATIONAL SPECTROSCOPY OF SHOCK-COMPRESSED FLUIDS **c25**

Stephen C. Schmidt, James D. Johnson, David S. Moore, Milton S. Shaw, and Richard LeSar *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 131-147 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Coherent anti-Stokes Raman spectroscopy is being used to study the structure and energy transfer in simple molecular liquids at high pressures and temperatures. Dense fluids to several thousand degrees temperature and several hundred kilobars pressure are obtained using the shock compression technique. These pressures and temperatures are comparable to those experienced during explosive detonation and product expansion. Vibrational frequencies, third-order susceptibility ratios and line widths have been determined for N2, O2, CO, mixtures of N2, O2, and CO, and N2O by comparing experimental data to spectra calculated using a semiclassical model. Frequencies are found to increase with pressure. Transition intensity and line width data suggest that thermal equilibrium of the vibrational levels is attained in less than a few nanoseconds at the high pressures and temperatures. Vibrational temperatures obtained are compared to those derived from equation of state calculations. Author (revised)

EXAMINATION OF SHOCK INDUCED CHEMICAL REACTIONS IN LIQUIDS USING TIME-RESOLVED OPTICAL SPECTROSCOPY **c25**

Yogendra M. Gupta *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 149-162 Sponsored by ONR (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The overall objective of our work is to develop a detailed understanding of shock induced chemical changes in condensed energetic materials. An extensive experimental effort was undertaken at Washington State University during the 1980's to permit time-resolved, spectroscopic measurements in shocked materials. Because of practical constraints at an academic institution, our work to date has focused on liquid CS2 which was known to undergo a shock-induced chemical change from the continuum measurements and analyses reported by Sheffield. Time-resolved absorption, reflection and Raman (preliminary) experiments have been carried out on liquid CS2 shocked to 115 kbar. Most of the experiments involved reverberation shocks or step-wise-loading (SWL); some of the reflection spectroscopy experiments involved double shock loading to relate the absorption results (SWL) to continuum results (single and double shock loading). Absorption results from very thin sample (1 micrometer) measurements were noteworthy in that the full absorption band (centered at 320 nanometers) could be examined. Our results show that both pressure and temperature alter the electronic properties of CS2. Threshold pressure for chemical reactions ranged from 88-115 kbar in step-wise-loading experiments depending on the temperature. The primary roles of pressure and temperature are the delocalization of pi-electrons and formation of hot bands. The electron delocalization is likely a precursor to the chemical reaction. An important finding of the present work was the result that kinetics and molecular reorientation may be important factors in understanding shock-induced chemical reactions and in relating these data to static pressure results. The reflection experiments validate most of the conclusions from the absorption work. These results link the continuum and spectroscopic results for different thermodynamic states. Despite the many advances in the present work, the exact nature of shocked CS2 over the nanosecond to microsecond time scale has not been established. Vibrational spectroscopy is needed to address this issue. We have started work on nitromethane and preliminary results to date suggest that time-resolved Raman, absorption and reflection data can be obtained for this material. Author (revised)

A STERIC HINDRANCE MODEL FOR THE CRYSTAL ORIENTATION DEPENDENCE OF THE SHOCK INITIATION SENSITIVITY OF PETN EXPLOSIVE

Jerry J. Dick *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 163-165 (For primary document see N93-30061 11-28)

(Contract W-7405-eng-36)

(LA-UR-92-1427) Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Shock initiation sensitivity of PETN is strongly dependent on crystal orientation. This is explained by a model of steric hindrance at the molecular level due to shear flow associated with shock-induced uniaxial strain. The hindered shear is an endothermic, nonequilibrium process leading to bond breaking and subsequent exothermic decomposition reactions. In an earlier paper it was claimed that the (100) and (010) shock directions were not equivalent in terms of steric hindrance. If one considers the steric hindrance to shear motion of both the body-centered and corner molecules, then it appears that the directions are equivalent. The previous analysis had focussed on steric hindrance to motion of the body-centered molecule. In sensitive, hindered orientations the shear flow may be supercritical, that is, simultaneous shear may be occurring as the strength of the perfect lattice is exceeded. Examination of previously published elastic precursor strengths in inert materials makes it seem likely that simultaneous shear may occur in other materials where the primary slip system is not available, especially in quartz. SINGLE-SHOT FEMTOSECOND SPECTROSCOPY: A METHODOLOGY FOR OBSERVATION OF SOLID-STATE CHEMICAL REACTIONS **c25**

Weining Wang and Keith A. Nelson *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 167-172 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

We have constructed and begun testing an apparatus for single-shot femtosecond spectroscopy. A single probe pulse is split with n beam splitters to produce 2(n) separate probe pulses, each of which is delayed by a different amount and directed into the sample. In this manner 2(n) points on the time axis are monitored in a single laser shot. We have now recorded the first test data, using the apparatus with 16 probe pulses. This methodology will permit time-resolved solid-state photochemistry experiments in which absorption of the excitation pulse initiates chemistry in an electronic excited state. Another class of experiment involves not absorption but 'impulsive' stimulated Raman scattering (ISRS) of the femtosecond excitation pulse. Through ISRS, coherent lattice vibrations can be driven. It should be possible to reach large lattice vibrational amplitudes, comparable to those characteristic of shock waves (but with just a few, selected lattice modes excited). However this involves high light intensities which cause sample damage due to various nonlinear optical mechanisms. Recording the full time-resolved material response to ISRS 'microshock' excitation with just one laser shot will permit high intensities to be used. Sample damage will be greatly reduced, and will not prevent data collection even when it does occur. Derived from text

DETONATION MASS SPECTROMETRY c25

N. Roy Greiner, Herbert A. Fry, and Normand C. Blais *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 173-188 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Detonation reactions in laboratory-scale (30-250 mg) pellets of solid high explosives are quenched in a series of stages by unconfined free expansion into a high vacuum, and molecular species in the quenched reaction mixtures from 95 contiguous stages (volume elements) are characterized by dynamic time-of-flight mass spectrometry while the material is still expanding freely. The stage at which the detonation reaction begins to quench and the rate of quenching depend on the depth of the volume element in the pellet and the velocity of the rarefaction wave coming from the vacuum interface. Time-sequenced laser-schlieren images of the detonation and quench processes validate a computer model that links the observed chemical composition at each stage to the hydrodynamic history of the corresponding volume element based on the equation of state of the products from the explosive under study. From this analysis we deduce that each volume element to about 20 micrometers deeper in the pellet than the previous one. Sound speed estimates indicate that quenching begins about 3 nanoseconds later for additional layer, and the time-constant for the quench processes is also 3 nanoseconds per layer. These time and length scales should allow resolution of the reaction zone and reactions behind the reaction zone. Molecular models of detonation are challenged and refined by comparing observed mass spectra with spectra predicted by the models. Improved understanding of how molecular structure and reaction dynamics determine the sensitivity and performance of energetic materials is expected to guide both the development of better detonation models and the synthesis of new less sensitive and more powerful high explosives. STRATEGIES FOR UNDERSTANDING THE DEFLAGRATION-TO-DETONATION TRANSITION c25

Blaine W. Asay *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 227-242 Previously announced as N92-29512 Sponsored by DOE (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The deflagration-to-detonation (DDT) phenomenon has been studied for many years. However, no comprehensive model of the DDT process is available. It is important to understand the mechanism by which an explosive will detonate when the source of ignition is a weak shock or flame, and to be able to predict this response. We have identified several key areas of the DDT problem which need to be understood before any such prediction can be made, and have established a modest program to obtain a more fundamental understanding of the behavior of explosive under the conditions that can lead to DDT. THE OUTLOOK FOR UNDERSTANDING THE COMBUSTION OF SOLID PROPELLANTS AND WHAT IT WILL TAKE

Edward W. Price *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 243-260 Sponsored by ONR (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

An outlook for the development of an understanding of solid propellant combustion is presented. 'Understanding propellant combustion' is characterized as the description of the process in every nontrivial detail, in quantitative form suitable for prediction of the answers to any questions that might be posed by the propellant and rocket propulsion community, and prediction of new technological opportunities. The current understanding of steady state burning of heterogeneous propellants is reviewed and a research strategy for the investigation of propellants with new ingredients is outlined. CASI

NUMERICAL MODELING OF MULTIDIMENSIONAL FLAMES WITH APPLICATION TO ENERGETIC MATERIALS Abstract Only c25

Mitchell D. Smooke *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 261 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The coupling of adaptive numerical methods with large memory parallel/vector computers has produced an extremely powerful tool with which to probe flame structure. One such reacting system - the axisymmetric laminar diffusion flame is investigated numerically. The ability to predict the coupled effects of complex transport phenomena with detailed chemical kinetics in these flames is critical in the modeling of energetic materials such as heterogeneous propellants. An unconfined configuration in which a cylindrical fuel stream is surrounded by a coflowing oxidizer jet is considered. Computationally, the governing conservation equations of mass, momentum, species balance, and energy are solved with detailed transport and finite rate chemistry submodels. Up to six processors of an IBM ES/3090 600J in parallel are used to obtain a discrete solution on a two-dimensional grid with Newton's method and adaptive mesh refinement. Unlike some models in which diffusion in the axial direction is neglected, the fully elliptic problem is considered. Author (revised)

DETERMINATION OF GAS PHASE SPECIES AND TEMPERATURE PROFILES ABOVE SOLID PROPELLANTS

B. L. Fetherolf and Thomas A. Litzinger *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 263-274 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Through the support of the Office of Naval Research a microprobe mass spectrometer (MPMS) system has been developed to study the species profiles above the surface of oxidizers, binders and solid propellants during laser heating and laser supported combustion. The objective of the research is to measure the species profiles above the surface of the reacting materials so that the reaction paths responsible for the observed profiles can be determined. The MPMS system has been used to study HTPB, BAMO/NMMO, RDX, BLX-9, XM-39 and most recently ADN. During testing samples are withdrawn from the reacting gases using a quartz microprobe with an orifice diameter of approximately 20 microns which results in a spatial resolution of approximately 100 microns. The gases then enter the MS that can monitor twelve individual molecular weights or execute continuous scans of molecular weight over the range of 2 to 500 amu at rates up to 2000 amu/s. To obtain the spatial variation of the species above the sample surface, the sample position is controlled by a linear actuator which is linked to the microcomputer that controls the MPMS. In addition to the species profiles, temperature profiles in the gas phase are determined using micro thermocouples. In the ADN results reported here, the initial atmosphere was Argon at pressures up to three atmospheres, and the heat flux was 100 W/sq cm for all tests. Testing included molecular weight scans and selected ion monitoring as well as testing with and without movement of the sample. In the molecular weight scans no species with molecular weight above 50 were detected. The major products leaving the sample surface were, in decreasing order of concentration, N2O, H2O, N2, NO2 and NH3. Several tests also indicated reaction of these species which resulted in increases in the concentration of H2O and N2 as well as the production of NO and O2. Based upon the observed species profiles possible reaction routes are suggested and preliminary modeling is performed. The initial modeling is done with an experimentally derived temperature profile imposed on the reaction. The results of the modeling study show the correct trends in major species. Derived from text

FLAME STRUCTURE STUDIES OF PROPELLANT LIKE LOW PRESSURE FLAMES USING OPTICAL AND MASS SPECTROMETRIC MEANS c25

Andrzej W. Miziolek, R. C. Sausa, W. R. Anderson, D. C. Dayton, C. M. Faust, S. L. Howard, and S. A. Barts *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 275-297 Sponsored by ONR (For primary document see N93-30061 11-28)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The chemistry of propellant like flames is being studied using a well-instrumented flame structure research apparatus which incorporates a number of flame diagnostic techniques for determining flame structure parameters such as temperature, major stable and reactive species profiles. Optical techniques include laser induced fluorescence (LIF), resonance enhanced multiphoton ionization (REM PI), Fourier Transform Infrared (FTIR) spectrometry, and a tunable diode laser (TDL). Also included is a molecular beam mass spectrometer (MB/MS) system consisting of a quartz sampler and a triple quadrupole mass spectrometer. The MB/MS system is a very powerful flame diagnostic tool since it can detect virtually all major and minor flame species. However, the quartz sampler is a potential source of considerable flame perturbation since it can be a substantial heat sink as well as a possible disturbance to the flow field. One of our first studies was aimed at the determination of the flame perturbation by the quartz sampler. In this work we compared the flame profiles for H, O, OH, and CO in a C2H4/O2/Ar flame using optical diagnostics (REM PI for H, LIF for O and OH, and TDL for CO) and the MB/MS technique. In all cases the agreement was found to be good, thus giving us confidence concerning the validity of using the MB/MS flame profile data for flame model comparisons. In a related study using a C2H4/N2O/Ar flame we demonstrated the usefulness of the triple quadruple by distinguishing between CO, N2, and C2H4 which all have a nominal m/z = 28. Similarly, we were able to discriminate between CO2 and N2O at m/z = 44. We have completed a comprehensive experimental and modeling study of a stoichiometric H2/N2O/Ar flame which is one of the simplest nitrogen oxide flames. In this study we have been able to investigate the importance of certain key elementary reactions and to determine the reaction mechanisms for the flame nitrogen species. Upcoming flame structure studies will involve nitrogen dioxide as the primary oxidizer. Author (revised)

PRESSURE DEPENDENCE OF THE REACTION PROPAGATION RATE OF TATB TO 40 GPa c25

M. Frances Foltz and Albert L. Nichols, III *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 299-310 (For primary document see N93-30061 11-28)
(Contract W-7405-eng-48)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The insensitive high explosive 1,3,5-triamino 2,4,6-trinitro-benzene (TATB), laser ignited under high pressure in a diamond anvil cell, exhibits strongly pressure-dependent reaction propagation rates (RPR). Discontinuities in the RPR as a function of pressure (3-40 GPa) were observed at 19, 30, and 40 +/- 1 GPa. Increasing pressure caused a progressive shift in color of the TATB, from yellow at ambient pressure to red, then to black above 30 GPa. In addition, the appearance of high pressure inclusions (sharply delineated polycrystalline zones) was noted. A phase transition analogous to that between graphite and diamond to produce a dense 3-D network wurtzitane structure is postulated. Preliminary work on the high pressure behavior of TATB analogs and aromatic complexes is discussed. A comparison of present data is made with the previously published pressure-dependent RPR curve for nitromethane. Viewgraphs are provided. Author (revised)

THERMAL DECOMPOSITION PATHWAYS OF RDX IN THE CONDENSED PHASE

Richard Behrens, Jr. and Suryanarayana Bulusu (Army Armament Research, Development and Engineering Center, Picatinny Arsenal, NJ.) *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 311-340 Submitted for publication Sponsored by ARO and Army Armament Research, Development and Engineering Center (For primary document see N93-30061 11-28)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Through the use of simultaneous thermogravimetry modulated beam mass spectrometry (STMBMS) measurements, time-of-flight (TOF) velocity spectra analysis, and H-2, C-13, N-15, and O-18 labeled analogues of RDX, the thermal decomposition products of RDX were identified as H2O, HCN, CO, CH2O, NO, N2O, NH2CHO, NO2, HONO, (CH3)NHCHO, oxy-s-triazine (OST) and 1-nitroso-3, 5-dinitro-hexahydro-s-triazine (ONDNTA). By measuring the temporal behaviors of the gas formation rates of each of these products during a decomposition experiment, the primary reaction pathways that control the decomposition of RDX in both the solid and liquid phases were discovered. Viewgraphs and a description are presented. Author (revised)

KINETIC STUDIES ON GAS-PHASE REACTION MECHANISMS IMPORTANT TO THE COMBUSTION OF ENERGETIC MATERIALS: THE CO/N2O REACTION

Richard A. Yetter, Frederick L. Dryer, M. Allen, and N. Ilincic *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 341-357 (For primary document see N93-30061 11-28)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Kinetic experiments and modeling calculations on the high temperature reaction of gas phase intermediates associated with the combustion process of energetic polycyclic nitramines and energetic polymers are reported. The chemical systems of interest include the fuels H2, CO, CH2O, CH4, C2H4, HCN, and NH3 and the oxidizers NO2 and N2O. Many of these species have been observed experimentally and/or predicted numerically in the gas-phase above burning propellants. The combinations of these fuels and oxidizers form basic sets of gas-phase kinetic systems necessary to understand in order to build hierarchical reaction mechanisms for the combustion of energetic materials. Results are presented for CO reacting with N2O. The experiments are conducted in a variable temperature (600 K less than T less than 1200 K), variable pressure (1 atm. less than P less than 15 atm.) flow reactor with residence times ranging from 10 ms to 10 s. Reactant, intermediate, and product species concentrations as a function of reaction time are obtained via continuous sampling/thermal quenching of a small fraction of the total gas flow with a stainless steel, water-cooled probe which traverses the length of the 10 cm. diameter reactor tube along its center-line. Analytical detection and quantification of stable species is performed in the sample line by on-line Fourier transform infrared analysis. Additional continuous monitoring of several species is obtained by non-dispersive infrared analysis for CO and CO2 concentrations, by chemiluminescence analysis for NO and NO2 concentrations, by electrochemical analysis for O2 concentration, and by selective thermal conductivity analysis for H2 concentration. Off-line analysis of stable species includes gas chromatography and gas chromatography/mass spectrometry. Temperature measurements are obtained by fine wire silica-coated Pt/Pt-13%Rh thermocouples. The modeling aspects emphasize the use of hierarchical reaction mechanism construction and validation along with reaction flux and gradient sensitivity analysis. Validations of the reaction mechanisms are obtained by comparison of the predicted concentration profiles with the experimentally measured profiles and by sensitivity analysis calculations. Sensitivity analysis is used for coordinating experiment and model development and to identify key species and reactions, and hence, suggest thermochemical and kinetic parameters for future theoretical and experimental study. The results show that in near dry CO/N2O systems, the reaction of CO + N2O yields CO2 + N2 is important and found to have a rate the order of 10(exp 6) cu cm/mol(s). Hydrogen impurities are shown to lower the overall activation energy of the reaction. In the wet CO/O2 system, the rate of CO + HO2 yields CO2 + OH is likely four times larger than recommended literature values. Author (revised)

UNSTEADY COMBUSTION OF ENERGETIC MATERIALS USING LASER-RECOIL **c25**

Quinn Brewster and Steven Son *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 359-366 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

A theoretical and experimental investigation is being conducted on the unsteady combustion of various energetic materials and solid propellants under dynamic radiant heating conditions. The basis of the experimental study is a laser-recoil technique. This technique uses a spatially uniform laser beam to augment and perturb the combustion of the propellant. The recoil thrust is measured using a microforce transducer. Fiber optic transmission measurements are conducted to quantify the laser transmission loss upon passing through the combustion product plume. The analysis is currently being carried out under the assumptions of quasi-steady gas and surface reaction, homogeneous propellant, and one-dimensional flame (or QSHOD theory). The classical linear QSHOD theory was generalized to include the effect of external radiant flux with in-depth absorption. This was done in both the framework of the Zeldovich-Novozkilov (ZN) phenomenological theory and that of the flame description (FD) approach. The relationship of these two approaches was demonstrated for the generalized radiant flux case. The general (non-linear) QSHOD theory was also extended to include external radiation with in-depth absorption and some numerical studies of non-linear effects were conducted. These studies illustrate an effect of the mean radiant flux on the combustion response (both linear and non-linear) which has previously been neglected by most researchers in this area. The theoretical results also indicate the importance of in-depth absorption for most wavelength-material combinations. Also, a method for obtaining the linear response function over a range of frequencies from a single test using a series of radiant pulses is demonstrated. Experimental results were obtained for conventional propellants and energetic materials such as double base propellants and AP/HTPB. These results demonstrate that the laser-recoil technique, when combined with combustion modeling comparisons, offers significant promise as a laboratory technique for characterizing the unsteady combustion of propellants and energetic materials. In this regard, laser-recoil tests offer a significant savings in time and cost relative to T-burner testing. It also appears to be a very sensitive technique for obtaining kinetic parameters under combustion-like conditions. The need for such techniques has been receiving increasing recognition lately. And finally, laser-recoil tests offer a new experimental technique for studying the fundamental mechanism of propellant and energetic material combustion, allowing investigation of the classical QSHOD assumptions as well as the basic behavior of the leading edge flame in multi-dimensional composite propellants. DISLOCATION ROLES IN ENERGETIC CRYSTAL RESPONSES

Ronald W. Armstrong and Wayne L. Elban (Loyola Coll., Baltimore, MD.) *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 367-378 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Energetic crystals show an unusual combination of mechanical properties in being elastically-compliant, but also being relatively hard and brittle. Evidence is presented for the important role that dislocations play in providing an understanding of these strength properties and how they relate to the responses of energetic crystals to mechanical forces or imposed deformations, as occur in impact tests, shocks, and combustion processes. METALLIZATION AT DETONATION FRONTS IN SOLIDS **c25**

John J. Gilman *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 379-394 (For primary document see N93-30061 11-28)

Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Detonation fronts propagate too fast for thermal activation of the chemical reactions that drive them. Direct electronic excitation is needed. It is proposed that the compression in the front causes metallization of the energetic solid; making it an insulator-metal interface. The compressed conduction electrons provide the high pressure gradient needed to accelerate the ions at the front up to the detonation velocity. A simple method (based on the Keyes antibonding potential) for estimating the pressure peak is given. The calculated peak pressure is about 3B/2 where B is the bulk modulus of the initial solid (compressed state of the material). Thus it is in the megabar range. Herzfeld's theory of the insulator-metal transition which is used to estimate the critical compression for lead azide, and other ionic materials, is presented. It is consistent with the relative sensitivities of the azides. Another model for electronic excitation, Zener band-to-band tunneling, is discussed briefly. In addition to being induced by volumetric compression, metallization can be induced by large shear strains; that is, by large changes in covalent bond angles. This is known to cause metallization in semiconductors (C, Si, Ge, and Sn) when the tetrahedral angle is increased from 109.5 deg to 149.5 deg. It is shown that this critical angular change is consistent with the simple Pauling theory of the covalent bond. The implications for energetic materials such as PETN is discussed. Metallization can be phonon assisted so it is temperature, as well as deformation, dependent. In organic-type materials, it is also facilitated by electron delocalization. This is why the sensitivities of organic explosives tend to depend on the amount of resonance in their bonding. Viewgraphs are provided. Author

Macrocracking and distributed microcracking in particle-filled rubber are addressed, assuming quasi-static growth (crack speed approx. less than 30 m/s). As an increase in fracture surface area may lead to an increase in sensitivity, interest is in those factors that influence crack growth as well as ways in which this growth can be minimized. Crack growth depends on the driving force as well as the material parameters which determine the resistance to growth. First the driving force and these parameters are discussed, and then behavior for macrocracking at various strain rates, pressures, and temperatures is illustrated. Next, a micromechanical model for predicting microcrack growth in particle-filled rubber is described. The same principles that are used for predicting macrocracking are applied to microcracking. For a propellant which is elastic (except for damage growth), this model leads to an equation that relates the amount of microcracking at a given time to the applied strain Epsilon, undamaged Young's modulus E, characteristic particle size R, and fracture energy G(sub c) (for adhesive or cohesive cracks). Thus, there is a basic dimensionless ratio involving only material parameters and which directly controls the extent of microcracking, Pi(sub 1) = RE/G(sub c). The smaller Pi(sub 1) is the smaller will be the degree of microcracking at a given strain and time. For viscoelastic propellant behavior, a similar result is obtained, but E must be replaced by a suitably defined, effective modulus. The modulus E depends on the shape of the distribution function for particle sizes but not on the size itself. Increased resistance to microcrack growth, for a given strain and particle volume fraction, may be achieved by increasing G(sub c) or by minimizing the product RE through the selection of the distribution of particle sizes. As the last topic, how this latter change can be accomplished is illustrated. The approach consists of first recognizing that the particle size distribution which minimizes the viscosity eta of the uncured propellant mix also minimizes E because E is proportional to eta. Principles for minimizing RE, for any given particle volume fraction and minimum particle size, are described. Author (revised)

Research on the role of hot spots in the sensitivity of explosives goes back over a century, but has accelerated significantly in recent years. The difficulty of observing very small regions that are hot for only a very short time makes theoretical results, which can provide important insights, particularly relevant. Hot spots are often associated with void collapse, but there is increasing evidence that the heating localized in shear cracks and shear bands can lead to ignition, and I proposed some years ago that this is the mechanism underlying XDT. Experimental results of Howe and others show that melting occurs in these defects. I will describe how melting was incorporated into the SCRAM code and illustrate its importance with sample calculations for TNT, the explosive used in Howe's BRL experiments. It is emphasized that the thickness of the melted zone is on the order of microns, whereas the HE dimensions are on the order of 10 cm. Thus, special sub-grid methods are required to carry out such calculations. The unified theory of flow, fracture, and fragmentation underlying SCRAM has been developed over a twenty-year period in connection with a variety of applied programs. Author (revised)

Advanced underwater explosive all-gas-product concepts have evolved that may employ mixed nitramine difluoroamino explosives, dinitramino salts, energetic polymers, and aluminum or boron particles. Achieving maximum effectiveness in the application of these new concepts requires the ability to control the post-detonation bubble energy release rates. These rates are intimately coupled to the boron and/or aluminum particle combustion processes that would occur in high pressure, fluorine rich detonation product gases. A homogeneous gas phase kinetic model for high temperature B/O/H/C/F combustion systems is presented. Model results are presented which illustrate the effects of mixture temperature, pressure, and composition on the reaction dynamics of boron oxides, oxyhydrides, fluorides, and oxyfluorides. Reaction flux/pathway techniques and sensitivity analysis theory of isothermal systems are used to identify important reactions. Model results indicate that OBF(g) is a key high temperature intermediate that plays a role similar to HOBO(g) in B/O/C/H combustion systems. Author (revised)

The (210) surface of ammonium perchlorate (NH4ClO4) with an atomic force microscope in air is studied. Large scale images show monomolecular steps that are often aligned with major crystalline directions. Surface modification is clearly observed with forces as low as 3O nN, but is usually limited to the bottom and the sides of the field of view, where the tip scans for a long time and where it turns around, respectively. At the molecular scale, structures with substantial order, with minimum lateral sizes of 3A were observed. The identification of these features is difficult due to the large unit cell of this compound (40 atoms per unit cell), and the lack of perfect order in the images. The SARCH/LATUSE program developed by Van Hove and Hermann was used to analyze this structure. Ammonium perchlorate is hygroscopic; it is therefore possible that surface modification is enhanced by the moisture present in air. Experiments in a dry atmosphere have recently confirmed this explanation. Author (revised)

A number of single crystals of ammonium perchlorate (AP) were shock loaded near the reaction threshold to investigate the effects of concentrated lattice defects (dislocations) and differing crystal orientations on chemical reactivity. Large, optical quality crystals of pure AP were immersed in mineral oil and shocked through either the (001) or (210) surfaces by a detonator. Prior to shock loading, some crystals had localized regions of increased lattice defects and strain created by placing diamond pyramid (Vickers) hardness impressions into their exterior cleavage surfaces. High-speed photographs showed the occurrence of the same slip deformation that was previously determined from hardness testing, and preferential cracking and luminosity near some of the hardness impressions. The shocked crystals were recovered, sometimes intact, for microstructural characterization and chemical analyses. Crystal orientation relative to the shock propagation direction changed the dynamic response and threshold for decomposition of the crystal, much as accommodating the hardness indenter required different slip and crack systems for the various surfaces of unshocked crystals. One recovered crystal was cleaved twice through hardness impressions on the (001) and shock-entry (210) surfaces, allowing spatial analysis of the interior regions of the crystal using x-ray photoelectron spectroscopy (XPS). Along these freshly cleaved surfaces, the XPS results showed enhanced lattice disruption and perchlorate decomposition as a result of the hardness impressions. The greatest decomposition was not immediately adjacent to the impressions, but near the tips of cracks and along slip planes emanating from the impressions a long way into the crystal. Author

The line widths of x-ray photoelectron spectra have been correlated with dislocation densities in a shock-damaged crystal of ammonium perchlorate (AP). A centimeter-size AP crystal was initially transparent except for several diamond pyramid (Vickers) hardness impression, which provided localized strain centers. The crystal was non-uniformly damaged by a rapidly decaying shock (peak pressure of 24.4 kbar at the entry surface), recovered intact, and cleaved through the impressions. Those cleaved planes permitted interior analysis of the crystal by x-ray photoelectron spectroscopy (XPS) over 1 mm by 1 mm areas. The Cl(2p3,2) line width of the spectra ranged from 1.70 eV for the region of greatest visible damage to 1.22 eV for the region of no visible damage, the same line width as that for unshocked AP (control). The observed damage was compared to photographs in the literature of irradiated AP crystals, for which dislocations densities were reported. This provided an approximate correlation of dislocation density versus XPS line width that was refined by chemically etching and counting dislocations on another cleaved plane in the recovered crystal. By this technique, an approximate 100 times increase in dislocation density was determined for the region of greatest shock damage. While XPS line widths were relatively unaffected by the hardness impressions, their associated strain fields enhanced perchlorate decomposition. Assuming that those perchlorate anions in the vicinity adjacent to dislocations were distorted, ab initio calculations predicted variations in the 2p orbital energy of 0.01 to 0.46 eV, thereby producing the observed line width broadening.

The role of microstructure on the shock reactivity of large single crystals of cyclotrimethylenetrinitramine (RDX) and ammonium perchlorate (AP) is being studied. Variation in material microstructure was controlled by putting strain centers in external surfaces with indentation hardness testing prior to shock loading and by changing crystal orientation relative to shock propagation direction. Preparatory to the shock experiments, diamond pyramid (Vickers and Knoop) microindentation hardness testing was performed at low strain rates. The resultant plastic impressions were analyzed in detail to yield information about slip and cracking systems, the size and character of the cumulative dislocation strain fields surrounding the impressions, and the effect of cracking on hardness with increasing applied load. The crystals were shock loaded by a detonator at a known standoff distance in an aquarium apparatus containing mineral oil. An image converter camera operating at 1 to 5 million frames per second recorded the spherically expanding shock in the mineral oil, the passage of the shock through the crystal, and the crystal response after shock loading. A number of the shocked crystals were recovered for subsequent microstructural characterization and chemical analysis. Author (revised)

Although our knowledge of energetic-material phenomena such as detonation, combustion, decomposition, deflagration-to-detonation transition (DDT), and shock initiation has increased greatly, there are still many mechanisms that we do not understand well and cannot predict accurately. The response of energetic materials plays an integral role in intrinsic-surety issues such as safeguarding, refitting, or retiring weapons in stockpile as well as in commercial enterprises. The Nuclear Safety Department at Sandia National Laboratories (SNL) is responsible for characterizing energetic-material response relating to such issues. A number of test series are planned and in progress to investigate the violence of reaction in cookoff, the shock initiation as a function of thermal degradation and mechanical damage, and early phases of combustion and DDT. Some of these activities are described. Author (revised)

The relationship between the detonation velocity normal to the shock-front and the shock-front curvature was obtained from experimental detonation velocities and shock front shapes for an ammonium nitrate-based emulsion explosive with a density of 1.248 g/cc. By using this relationship in the quasi one-dimensional Euler equations obtained from the detonation shock dynamics theory (DSD), the reaction rate for this material was determined as a function of pressure and density. The one-dimensional initiation experiment (wedge test) was numerically modeled using this rate law. The calculated shock trajectories agreed with the experimental wedge test data over a wide range of initial pressures. This agreement suggests that the small shock-curvature asymptotics that underlies DSD may be valid even for relatively large shock curvatures. The reaction-rate equation obtained for this emulsion explosive shows that the rate is very slow and weakly state dependent. These characteristics of the rate indicated that the nonideal behavior of most emulsion-type explosives can be attributed to their slow and state-insensitive rates. The calibration method developed in this study is independent of the form of the rate. Realistic rate equations for explosives can be obtained in a very systematic way from two-dimensional steady-state experiments interpreted with DSD. Author (revised)

We examined, using computational molecular dynamics, shocks produced in two- and three dimensional atomic and molecular crystals through impact and end loading. The effect of various lattice defects on the shock propagation and the transition to detonation is investigated. It is observed that small defects in the lattice structure have a large effect on the shock and detonation dynamics. Intermolecular potentials are of the Lennard-Jones type, with chemical bonds represented by predissociative classical potentials and elaborations thereof. In a three-dimensional simulation of a shock in a crystal containing a vacancy cluster defect (a small void), we find that the earliest release of chemical energy occurs at the site of the defect, aside from the crystal surface. This is also the site of a small hot spot. Further conclusions about the effect of defects on the subsequent propagation of the detonation front, and, especially, on shock sensitivity, must await simulations on larger three-dimensional systems. Our earlier computational experiments on shocks in nonreacting crystals indicate that the detailed dynamics of the shock-defect interaction, and the resulting thermalization of the fluid-phase inclusion that results, is rather different in two- and three-dimensions, and therefore realistic conclusions concerning the role of crystallographic defects on shock sensitivity should be based on three-dimensional computations. As a well-resolved molecular dynamics simulation in a 3-d condensed phase requires the forces due to approximately a thousand nearest neighbors to be calculated for each atom, the computing requirements for even moderately large systems (greater than 104 particles) are substantial. We have found massively parallel computer architectures to be helpful in dealing with this problem; the computations shown here were carried out on a 16 kiloprocessor Connection Machine, for which we have developed a parallelized version of the MLG particle tracking algorithm. APPLICATIONS OF DENSITY FUNCTIONAL THEORY TO CALCULATION OF REACTION ENERGETICS Abstract Only
Peter Politzer *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 497 (For primary document see N93-30061 11-28)

We are increasingly using the methodology of density functional theory for computational studies of energetic molecules. This approach focuses upon the electron density rather than upon a wave function, with a consequent considerable saving of computer time and resources. Density functional procedures do take account of electronic correlation; accordingly it is possible to obtain results of accuracy comparable to post-Hartree-Fock ab initio methods (e.g. Moeller-Plesset and configuration interaction). Most of our density functional work in the past has invoked the local density approximation (LDA), whereby exchange and correlation effects are treated by means of the uniform electron gas model. However, we are increasingly going above the LDA level, and using nonlocal formulations. In this presentation, we report five sets of results: (1) activation energies for the concerted ring-opening dissociations of four cyclic molecules -- 1,3-diaza cyclobutane, 1,3-dinitro diazacyclobutane, 1,3,5-triaza cyclohexane, and 1,3,5-trinitro triazacyclohexane (RDX); (2) activation and total energies of isomerization of unsaturated molecules to highly-strained cage-like systems; (3) heterolytic C-N dissociation energies for cubane dinitramine and methyl dinitramine; (4) C-NO2 and N-NO2 rotational barriers; and (5) general comparison of dissociation energies computed at local and nonlocal levels. RATE CONSTANT DETERMINATIONS OF REACTIONS H + HNO FROM AB INITIO REACTION PATH CALCULATIONS Abstract Only **c25**
Maribel R. Soto and Michael Page *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 499 (For primary document see N93-30061 11-28)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

The reaction of H + HNO has been proposed as an intermediate step in the rate mechanism of processes such as the inhibition of hydrocarbon combustion by nitric oxide, the reaction of radicals with NO in the atmosphere, and the combustion of nitrogen-containing species. A facile and substantially exothermic channel for this reaction is hydrogen-atom abstraction, H + HNO yields H2 + NO (reaction (1)). This reaction is more than 50 kcal/mol exothermic; therefore, it is expected to have a negligible barrier or none at all. Kinetic data for reaction (1) exists for flame temperatures except they disagree by as much as an order of magnitude. The most widely accepted value is 0.8 x 10 exp -11 cc/(molecule x sec.) determined at 2000 K by Halstead and Jenkins. At low temperatures, there have been several indirect determinations which also disagree markedly. Furthermore, the temperature-dependence of this reaction is poorly understood. Another possible pathway for H + HNO is H-atom addition to the nitrogen atom of HNO: H + HNO yields H2NO ((sup 2) A') (reaction (2)) and H + HNO yields H2NO ((sup 2) A') (reaction (3)). Like the abstraction, these reactions are also expected to be substantially exothermic; therefore, they may also have a low barrier. At high pressures, an addition complex can be collisionally stabilized, and one of these addition reactions might compete effectively with the abstraction reaction. In our work, we investigate the reaction pathways of reactions (1) and (2) using ab initio multi-configuration self-consistent field (MCSCF) and configuration interaction (CI) methods. Also, we use transition state theory to calculate the temperature-dependent rate constants of these reactions. Our objective is to address the controversy about the rate of reaction (1) and to understand the possible competition between these two reactive channels. Author (revised)

Molecular dynamics has been shown to be ideally suited for studying shock wave phenomena giving results consistent with continuum theory. In this paper, we use reactive potentials together with molecular dynamics techniques to simulate at the atomic scale the onset and propagation of chemically-sustained shock waves in a model energetic molecular solid. Once this material initiates, physical properties such as temperature, particle flow and detonation velocities, pressure and power generation are all consistent with a detonation. The shock wave is chemically-sustained by the consumption of the initial energetic AB material to form A2 and B2 products with an associated release of energy that sustains the propagation of the shock wave at a constant velocity. These identifiable products form at the rear of a high-density dissociative phase with an associated release of potential energy. A lower density compressional wave preceeds this dissociative phase allowing these simulations to exhibit a stable growing split shock wave. This split shock wave can be modeled in a nonenergetic material and results from the polymorphic phase transition of the molecular solid to the close-packed solid of the dissociative phase. The presence of this dissociative phase and its associated polymorphic phase transition appear to be key factors for the formation of a chemically-sustained shock wave in these simulations. Our results suggest the potential importance of dissociative phases, polymorphic phase transitions, and rarefaction shocks in understanding the formation and evolution of detonations in condensed energetic materials. GAS ELECTRON DIFFRACTION EMPLOYING A PULSED ELECTRON BEAM SYNCHRONOUS WITH PHOTOEXCITATION Abstract Only **c25**
John D. Ewbank, Jing Y. Luo, Jeffrey T. English, Walter L. Faust, and Lothar Schafer *In* JHU, ONR/LANL Workshop on the Fundamental Physics and Chemistry of Combustion, Initiation, and Detonation of Energetic Materials Mar. 1992 p 503 (For primary document see N93-30061 11-28)
Avail: CPIA, 10630 Little Patuxent Pkwy., Suite 202, Columbia, MD 21044-3200 HC

Work was continued to put a GED instrument into operation that uses a pulsed electron beam synchronous with photoexcitation. Excimer laser pulses (ArF, 193 nm, 15 ns FWHM, 30 mJ) are directed onto a tantalum photocathode within a Pierce-type electron gun. Electron pulses, generated by photoemission, are accelerated through a potential of 40 keV, and focused onto target molecules entering the diffraction chamber through a nozzle orifice. Pulses from a second excimer laser, synchronized with the first, excite the target gases in the scattering center. Within a well defined and variable time interval r (including r less than or = O) the diagnostic electron pulses are scattered by the excited species. The diffraction intensities are recorded by the real-time technique developed at the University of Arkansas. Author (revised)

Our poster presents a first report on a program whose goal is to develop the technique of fast-response spectral infrared fiber optic probing of burning propellant strands, and demonstrate it in mechanism studies of condensed phase processes in nitramine propellant combustion. We are beginning the second year of a three-year program and, having assembled most of our experimental apparatus, are turning to a series of preliminary observations which will allow better understanding of the full experiments. The basic experiment involves a modulated infrared source, a pair of fibers meeting in the propellant strand with a small absorption gap between them, and (initially) infrared detectors with interference filters which select spectral regions including absorption bands of decomposition product molecules (an infrared detector array and monochromator is clearly the ideal detection system). Also included in the experimental apparatus are a high pressure strand burner and a video camera and recorder system which will allow both observation of the burning strand and high magnification viewing of the fibers during setup and testing. We have begun burning propellant strands, and have found conditions which seem adequate for first experiments. Transmission measurements on thin slices of propellant indicate a useful spectral window within which a number of decomposition product molecules might be observed. We have also started transient heating studies using a hot filament rather than burning propellant to heat the fiber. These seem to indicate that the fibers may be useful well above their melting point. Next, we will be developing techniques to insert fibers into propellant strands, and to monitor whether they are properly aligned as insertion is performed. Author (revised)

THE MEASUREMENT OF ELECTRICAL CONDUCTIVITY IN DETONATING CONDENSED EXPLOSIVES
Douglas G. Tasker, Richard J. Lee, and Paul K. Gustavson Mar. 1993 59 p
(AD-A264482; NSWCDD/TR-92/218) Avail: CASI HC A04/MF A01

The time-resolved measurement of electrical conductivity provides a unique means of studying detonating explosives. The results of a large number of experiments are reported. Two types of experiments were performed; they measured bulk resistance and time-resolved conductivity. Some interesting effects, due to detonation wave instabilities, were observed when the explosives dimensions were close to criticality, i.e., close to failure diameter or thickness. The conductivity profile observed in the aluminized explosive PBXN-111 (formerly PBXW-1 15) is interesting and unusual. The results are probably due to a combination of wave instabilities and late reaction effects. This demonstrates one of the advantages of using conductivity measurements as a diagnostic tool. Wave instabilities are apparent that could not be determined by other means. DTIC

THE USE OF QUANTUM CHEMISTRY TO ESTIMATE THE PERFORMANCE AND PROPERTIES OF EXPLOSIVES
J. P. Ritchie 1992 17 p Presented at the 10th Detonation Symposium, Boston, MA, 12-16 Jul. 1993
(Contract W-7405-eng-36)
(DE92-040369; LA-UR-92-2824; CONF-930713-2) Avail: CASI HC A03/MF A01

The ready availability of high speed computers has led to the development of quantum chemistry techniques that can provide a variety of information about molecules. Heats of formation, geometries, vibrational frequencies, and charge distributions can be obtained with reasonable reliability. Depending upon the quantity of interest and the chemical composition of the molecule, the associated computer costs may range from moderate, requiring only scientific workstations, to immense, requiring current generation supercomputers and beyond. In addition, a wide assortment of techniques and programs from which to choose exist, each with its own strengths and weaknesses. This variety may seem baffling to the applications oriented non-specialist. Moreover, it is prudent to acknowledge that many quantities commonly used in estimating the performance of explosives can be obtained more cheaply and more accurately using methods that are not quantum chemical in nature. Such methods can be used quite effectively, provided that they have been properly parametrized in the regime of interest and that they are capable of producing information that is physically realistic. Nevertheless, quantum chemical techniques offer the opportunity of going beyond the familiar territory of C,H,N,O compounds. In addition, they also are capable of providing information about hypothetical molecules and states of matter. Two applications of quantum chemistry are described. The approach in each of these cases illustrates an informed choice of state-of-the-art techniques to obtain the desired results in a timely fashion. DOE

Activities of the Gas Research Institute's Power Generation and Transportation Systems subprogram for the period between 1 Oct. 1991 and 30 Sep. 1992 are summarized. The particular project areas covered in the report are Cogeneration and Power Systems, Engine Technology and Component Development, Natural Gas Vehicles Research, and Electric Power Generation. For each project area a separate chapter is provided. Each chapter includes a rationale for funding the research effort, the goals and objectives to be achieved, a general statement on research accomplishments, and the strategy employed in the project area. Each chapter also contains a series of summary reports on the status of each contract. NTIS

PREDICTION OF GAS-LIQUID TWO-PHASE FLOW REGIME IN MICROGRAVITY
Jinho Lee (National Academy of Sciences - National Research Council, Washington, DC.) and Jonathan A. Platt Jul. 1993 41 p
(RTOP 694-03-0A)
(NASA-TM-106274; E-7079; NAS 1.15:106274) Avail: CASI HC A03/MF A01

An attempt is made to predict gas-liquid two-phase flow regime in a pipe in a microgravity environment through scaling analysis based on dominant physical mechanisms. Simple inlet geometry is adopted in the analysis to see the effect of inlet configuration on flow regime transitions. Comparison of the prediction with the existing experimental data shows good agreement, though more work is required to better define some physical parameters. The analysis clarifies much of the physics involved in this problem and can be applied to other configurations. Author

EFFECTS OF BUOYANCY ON GAS JET DIFFUSION FLAMES Final Report
M. Yousef Bahadori and Raymond B. Edelman Apr. 1993 364 p
(Contract NAS3-22822; RTOP 694-03-0A)
(NASA-CR-191109; E-7720; NAS 1.26:191109) Avail: CASI HC A16/MF A03

The objective of this effort was to gain a better understanding of the fundamental phenomena involved in laminar gas jet diffusion flames in the absence of buoyancy by studying the transient phenomena of ignition and flame development, (quasi-) steady-state flame characteristics, soot effects, radiation, and, if any, extinction phenomena. This involved measurements of flame size and development, as well as temperature and radiation. Additionally, flame behavior, color, and luminosity were observed and recorded. The tests quantified the effects of Reynolds number, nozzle size, fuel reactivity and type, oxygen concentration, and pressure on flame characteristics. Analytical and numerical modeling efforts were also performed. Methane and propane flames were studied in the 2.2 Second Drop Tower and the 5.18-Second Zero-Gravity Facility of NASA LeRC. In addition, a preliminary series of tests were conducted in the KC-135 research aircraft. Both micro-gravity and normal-gravity flames were studied in this program. The results have provided unique and new information on the behavior and characteristics of gas jet diffusion flames in micro-gravity environments. Author (revised)

ADVANCED INSULATIONS FOR REFRIGERATOR/FREEZERS: THE POTENTIAL FOR NEW SHELL DESIGNS INCORPORATING POLYMER BARRIER CONSTRUCTION
B. T. Griffith and D. Arasteh Nov. 1992 23 p
(Contract DE-AC03-76SF-00098)
(DE93-010600; LBL-33376) Avail: CASI HC A03/MF A01

The impending phase-out of chlorofluorocarbons (CFC's) used to expand foam insulation, combined with requirements for increased energy efficiency, make the use of non-CFC-based high performance insulation technologies increasingly attractive. The majority of current efforts are directed at using advanced insulations in the form of thin, flat low-conductivity gas-filled or evacuated orthogonal panels, which are referred to as Advanced Insulation Panels (AIP's). AIP's can be used in composite with blown polymer foams to improve insulation performance in refrigerator/freezers (R/F's) of conventional design and manufacture. This AIP/foam composite approach is appealing because it appears to be a feasible, near-term method for incorporating advanced insulations into R/F's without substantial redesign or retooling. However, the requirements for adequate flow of foam during the foam-in-place operation impose limitations on the allowable thickness and coverage area of AIP's. Design alternatives which may offer a greater increase in overall thermal resistance than is possible with the use of AIP/foam composites in current R/F design are examined. These design alternatives generally involve a basic redesign of the R/F taking into account the unique requirements of advanced insulations and the importance of minimizing thermal bridging with high thermal resistance insulations. The focus is on R/F doors because they are relatively simple and independent R/F components and are therefore good candidates for development of alternative designs. R/F doors have significant thermal bridging problems due to the steel outer shell construction. A three dimensional finite difference computer modeling exercise of a R/F door geometry was used to compare the overall levels of thermal resistance (R-value) for various design configurations. DOE

DYNAMIC ICE STRUCTURE INTERACTION: THEORY AND APPLICATIONS Ph.D. Thesis - Helsinki Univ. of Technology
Esa Eranti (Pitkala, Lauri Ltd. Consulting Engineers, Helsinki, Finland.) 1992 84 p Sponsored by Technology Development Center of Finland; Academy of Finland; and Foundation of Civil Engineering
(VTT-Pubs-90; ISBN-9-51-384068-9; ETN-93-93777) Copyright Avail: CASI HC A05/MF A01

A theory of dynamic ice-structure interaction is described with transverse and torsional vibrations included. The theory is applicable to cases of pure crushing of ice against vertical structures as well as combined crushing and shearing of ice against inclined structures. The zonal ice failure approach is adapted, the structure being locally in contact with solid and broken ice alternatively. Simple rules are given for the development of the zonal ice force in the interaction process. The structural response, the zonal ice force components and the global ice force are found in an iterative step by step procedure based on the development of the theoretical distance between the zonal contact point and the ice edge. Medium scale ice-structure interaction tests performed on the ice tank using freshwater columnar grained ice are described. The practice of using aspect ratio curves or pressure area curves to predict effective ice pressures caused by columnar grained level ice is concluded to be generally invalid and may in some cases be even dangerous. Each situation is a special case of dynamic ice structure interaction and the effective ice pressure and the structural response records depend strongly on the geometric and dynamic properties of the structure. The proposed approach provides an upper bound solution for global ice force and structural response, in the sense that it assumes pure crushing or combined crushing and shearing failure of ice, and ignores reductions that may result from the failure modes. ADVANCED COLLAPSIBLE TANK FOR LIQUID CONTAINMENT
David T. Flanagan and Robert C. Hopkins (Houston Univ., Clear Lake, TX.) Jun. 1993 47 p
(Contract NAS9-18492)
(NASA-CR-188247; NAS 1.26:188247) Avail: CASI HC A03/MF A01

Tanks for bulk liquid containment will be required to support advanced planetary exploration programs. Potential applications include storage of potable, process, and waste water, and fuels and process chemicals. The launch mass and volume penalties inherent in rigid tanks suggest that collapsible tanks may be more efficient. Collapsible tanks are made of lightweight flexible material and can be folded compactly for storage and transport. Although collapsible tanks for terrestrial use are widely available, a new design was developed that has significantly less mass and bulk than existing models. Modelled after the shape of a sessible drop, this design features a dual membrane with a nearly uniform stress distribution and a low surface-to-volume ratio. It can be adapted to store a variety of liquids in nearly any environment with constant acceleration field. Three models of 10L, 50L, and 378L capacity have been constructed and tested. The 378L (100 gallon) model weighed less than 10 percent of a commercially available collapsible tank of equivalent capacity, and required less than 20 percent of the storage space when folded for transport. Planar or multilayer structural preforms are made having yarns extending in a bias direction of the preform. Angularly directed yarns can be inserted in planar and multilayer fabrics to increase shear strength of structural preforms made from the fabrics. In multilayer fabrics, the angle yarns can extend between layers to provide through-the-thickness reinforcement. Fabrics are formed by carrying yarns transversely across the fabric as the fabric advances. Fill yarns may be inserted by an insertion technique employing a pneumatic beating element. Angle yarn feeding arrangements are made readily removable to provide for the use of other weaving assemblies. Official Gazette of the U.S. Patent and Trademark Office

PRELIMINARY DEVELOPMENT OF A VTOL UNMANNED AIR VEHICLE FOR THE CLOSE-RANGE MISSION M.S. Thesis
Gregory A. Kress 29 Sep. 1992 88 p
(AD-A263514) Avail: CASI HC A05/MF A01

The preliminary development of a full-scale Vertical Takeoff and Landing (VTOL) Unmanned Air Vehicle (UAV) for the Close-Range mission was completed at the Naval Postgraduate School (NPS). The vehicle was based on half-scale ducted-fan investigations performed at the UAV Flight Research Lab. The resulting design is a fixed-duct, tail-sitter UAV with a canard-configured horizontal stabilizer. Major airframe components are used from previous UAV's and include the wings from a U.S. Army Aquila and the ducted fan from the U.S. Marine Corps AROD. Accomplishments include: (1) the design and fabrication of a carry-through spar, and (2) the design and construction of an engine test stand. The through spar was designed using finite element analysis and constructed from composite materials. The purpose of the test stand is to measure torque, horsepower, and thrust of an entire ducted fan or an individual engine. Completion of this thesis will pave the way for future NPS research into the growing interest in VTOL UAV technology. DTIC

ROBUST CONTROL VIA H-INFINITY OPTIMIZATION **c63**
J. R. Sveinsson and F. W. Fairman *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Two motivations for using a feedback controller are both concerned with reducing the system's sensitivity. One is the robust stability problem wherein a single controller is to be determined so as to stabilize any one of a number of possible plants drawn from a plant uncertainty set. Another example is the H-infinity optimization problem, in which the plant is assumed to have two sets of inputs (w and u) and two sets of outputs (z and y).

The controller which has input y and output u is then designed so as to stabilize the complete feedback system and to minimize the infinity norm of the resulting transfer function from w to z. Although the H-infinity problem was originally formulated and solved in the frequency domain, the recent emergence of a state space approach involving the solution of two indefinite Riccati equations is proving to be more practical. The robust stabilization problem is converted to an H-infinity optimal control problem, and the two Riccati equation approach is used to determine both the maximum allowable bound on the perturbations and the controller which stabilizes all members of the uncertainty set. CONTROL SYSTEM DESIGN AND MULTIPARAMETER VARIATIONS **c63**
James Morris Overton *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A new technique for designing control systems is presented and illustrated for the case of a position control servo with velocity feedback. According to this technique, an isomorphic comparison is made between a standard transfer function and the transfer function of the system to be designed. This comparison leads to a set of sensitivity functions for a corresponding set of control system network components. The derivatives of the ratios of the pole or zero position of the network transfer functions are calculated and a set of independent simultaneous equations are produced, one for each component. The equations are solved to obtain the specific values of the component parameters. This technique differs from the classical frequency domain design techniques in that the values of components are calculated rather than selected; in addition, it requires no high-level mathematics, is independent of both time and frequency, and does not require compensation. A CLOSED-FORM FORMULA FOR THE MANIPULATOR REGRESSOR **c63**
W.-S. Lu and Q.-H. Meng *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

An attempt is made to provide a closed-form formula for the regressor of a general n-degree of freedom robotic system in which the mass, center of mass, and inertia tensor of the payload are unknown. In practice, this is the most common case where parameter uncertainties are encountered. The approach to this problem is based on the observation that the unknown part of the Lagrangian for a working robot can be separated from the Lagrangian of the same robot with no payload. Owing to the additive nature of the Lagrangian, the approach adopted can readily be extended to treat robots with other unknown dynamic parameters such as the mass and inertia tensor of a certain link. Moreover, the formula obtained is found suitable as a starting point to further derive a closed-form formula for the so-called filtered regressor which was used in several globally stable adaptation laws. NONLINEAR PROCESSING OF PHASE VOCODED SPEECH **c32**
Luc Gagnon and W. F. McGee *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Although adaptive coding is in widespread use, the availability of very large scale integrated digital signal processing chips makes filterbank analysis and synthesis of speech signals very economical. This ear modeling simplifies the application of masking properties of the ear. Experiments were conducted to determine the number of filterbank outputs needed to reconstruct speech signals using a logarithmic bandpass filterbank consisting of an analysis and a synthesis filterbank. With eight outputs, the original speech sentence is found to be very clear; addition of 32 more outputs restores the breathiness to the sentence. A surprising degree of intelligibility is retained even with one output. The bandwidth of the speech signals is limited. The use of these filterbanks for speech enhancement and modest bitrate transmission appears favorable. Author (CISTI)

ON SUBBAND CODING/EMBEDDED VECTOR QUANTIZATION FOR SPEECH CODING **c32**
Lise Vanterpool and Jon W. Mark *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A procedure for constructing a subband/embedded vector quantization coder for speech coding is presented. The proposed coder has three major components: a bank of filters for partitioning the full-band signal into subbands; a quantizing scheme for the subband signals; and a suitable bit allocation algorithm. To reduce the complexity of the coding process, a form of hierarchical vector quantization is adopted in which each of the subband signals is decomposed into two roughly independent signals (gain and shape) that are coded individually. Experiments indicate that at a rate of 32 kbps, the coded speech is quite pleasant. However, at the design rate of 16 kbps, the system performance is poor. Nevertheless, the embedded coder developed is a fairly good design. Four subbands were used in the design; increasing the number of subbands should improve the system performance. Author (CISTI)

IMPROVEMENT OF THE NRC AUTOMATIC SPEECH RECOGNITION SYSTEM **c32**
Dariusz A. Zwierzynski and C. Lefebvre *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The ongoing research being conducted at Canada's National Research Council on the improvement of an automatic speech recognition (ASR) system is reviewed. The current speech recognizer is first described, and some examples of its performance are provided. Tests have demonstrated that the system performs well, particularly in adverse acoustic conditions, in comparison with other ASR algorithms. The rationale for work on the extraction and integration of segmental and prosodic features for enhancing recognition of plosive consonants is given. It is argued that the substitution error for word-initial plosives can be lowered if pitch information at voicing onset is used in recognition, along with segmental cues such as burst characteristics, voice onset time, and first formant transition. A robust pitch detection algorithm is outlined, and the strategy employing neurocomputing in a three-layer neural network for the processing of segmental and prosodic cues is explained. A structure of high-speed adaptive finite impulse response (FIR) digital filters is presented. The filters are based on delayed multipath implementation. The corresponding adaptive algorithm is developed for this structure which is applicable to arbitrary N-path realization, where N is greater than or equal to 2. The throughput rate of the present system can be N squared times that of a conventional adaptive FIR digital filter. Simulation results are included pertaining to the use of this structure and algorithm in an adaptive modeling system which is suitable for seismic exploration and other applications. Author (CISTI)

A compact analog complementary metal oxide semiconductor (CMOS) synaptic circuit with in-situ Hebbian learning was developed and used to construct a deterministic Boltzmann neural network. Investigations have shown that, because of the error compensating properties of the learning algorithm, neural network architectures such as the deterministic Boltzmann machine are robust even when constructed from compact, highly non-ideal analog CMOS components. The use of floating-gate field effect transistors for nonvolatile storage is also discussed. Author (CISTI)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The architecture of a motion detector using a modular neural network is presented. Each network module contains a number of sequence nodes connected in a chain, where each node is responsible for recognizing only one image in a sequence. When a correct sequence is presented, the nodes are activated one at a time, with each node providing an excitatory signal to its successor on the chain. The time element is modeled by providing the nodes with a fading memory. Temporal integration of the sequence nodes' activities by a result node is used to generate an output response representing the input sequence. Given a sequence of images of an object moving in a plane parallel to the image plane, the motion detector can be trained to estimate quantities such as the speed and direction of movement of the object. The network has been tested and simulated. Results show that the detector is insensitive to small differences between the training and test trajectories, can recognize partial sequences, and is tolerant to noise in the input. Author (CISTI)

AN ARTIFICIAL NEURAL NETWORK MODEL FOR PERIODIC TRAJECTORY GENERATION **c33**
S. Shankar, R. E. Gander, and H. C. Wood *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A neural network model based on biological systems was developed for potential robotic application. The model consists of three interconnected layers of artificial neurons or units: an input layer subdivided into state and plan units, an output layer, and a hidden layer between the two outer layers which serves to implement nonlinear mappings between the input and output activation vectors. Weighted connections are created between the three layers, and learning is effected by modifying these weights. Feedback connections between the output and the input state serve to make the network operate as a finite state machine. The activation vector of the plan units of the input layer emulates the supraspinal commands in biological central pattern generators in that different plan activation vectors correspond to different sequences or trajectories being recalled, even with different frequencies. Three trajectories were chosen for implementation, and learning was accomplished in 10,000 trials. The fault tolerant behavior, adaptiveness, and phase maintenance of the implemented network are discussed. Author (CISTI)

PARAMETER IDENTIFICATION OF TIME-VARYING SYSTEMS USING NEURAL NETWORKS **c33**
Keqin Gao, M. Omair Ahmad, and M. N. S. Swamy *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A neural network solution is introduced for the problem of parameter identification of time-varying systems. An autoregressive (AR) model is used to identify the unknown system. The problem is formulated to minimize the least squares (LS) error between the output of the unknown system and the output of the AR model when they are driven by a white Gaussian noise. Because of the time-varying nature of the unknown system, an exponentially weighted LS scheme is employed to attach more weight to the current data. A neural network is designated to estimate the solution of the weighted LS problem that gives the parameter of the AR model. Since this is an unconstrained quadratic optimization problem and the AR parameters can assume either + or - values, a hyperbolic tangent function is used as the nonlinear activation function for the neurons. A space iterative search technique is incorporated into the computational procedure of the neural network such that it can find solution in an open space rather than within a hypercube. In order to identify the time-varying parameters efficiently, recursive formulations are derived so that the coefficient of the neural network can be updated whenever a new observation is available. Finally, computer simulation results are presented to demonstrate the performance of the scheme. Author (CISTI)

PERFORMANCE ANALYSIS OF COMMUNICATION PROTOCOLS USING D-TIMED PETRI NET **c32**
G. H. Masapati and George M. White *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The application of D-timed Petri nets to performance analysis of the stop-and-wait communications protocol is examined. The model of this protocol includes the explicit modeling of losing messages, messages being damaged, and losing acknowledgements. The advantage of such a model is that it helps in understanding the effect of these errors on the performance of the stop-and-wait protocol. A calculation is presented of the optimum message block size for which the performance is maximum. For a transmission speed of 4800 bits/s, 32 non-data bits per block, an average of 0.00001 errors per bit, and a timeout interval of 4 seconds, the optimum message block size is found to be 20305 bits, with a maximum value of performance of 0.3716. A new method is proposed for the automatic synthesis of a computer communications protocol specification from a service specification. Both the service and the protocol specifications are modeled by finite state machines. The resulting synthesized protocol is guaranteed to be free from logical design (syntactic) errors and to conform to the service specification. In addition, the synthesized protocol is augmented by error-recovery patterns to enable recovery from transmission errors caused by an unreliable communication medium. An application of the new method to a service specification example is presented. Author (CISTI)

MODELLING OF CHANNEL THICKNESS MODULATION EFFECT IN SI GaAs MESFET'S **c76**
H. L. Kwok *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The current-voltage characteristics of metal semiconductor field effect transistors built on semi-insulating GaAs substrates is examined by taking into account the effect of channel thickness modulation due to carrier trapping. It is shown that, to a first-order approximation, the effect can be modeled by an additional term proportional to the drain current. A single equation with five parameters was used for the current-voltage characteristics in both the linear and the saturation regions. The equation agreed reasonably well with experimental results for small and large threshold voltages. Some detailed discussion is provided on the variations of the equation parameters under different biasing conditions. Author (CISTI)

SIMULATION OF TRANSIENT RADIATION EFFECTS ON SEMICONDUCTOR DEVICES USING A PULSED Q-SWITCHED Nd:YAG LASER c76
G. T. Pepper and S. M. Khanna *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Nuclear and space radiation can produce transient and permanent changes in the properties of semiconductor materials and devices, generally leading to performance degradation. A good understanding of the basic physical processes that affect semiconducting materials/devices is an essential first step in the process of achieving radiation hard devices. Electron linear accelerators and flash x-ray machines have been traditionally used for studying transient radiation effects in semiconducting devices and circuits. Preliminary results are presented which demonstrate that a Nd-YAG laser can be used as a low-cost alternative for such investigations. Short pulses of 1064 nm radiation from a pulsed Q-switched Nd-YAG laser were used to study transient photocurrent in a variety of Si and GaAs devices. Results show that militarily significant dose rates, in excess of 10(exp 11) rad(Si)/s, can be easily obtained with a relatively low-power Nd-YAG laser. This system may also be used for the simulation of single-event upsets that occur in spaceborne electronics. Author (CISTI)

RIB ARROW INTEGRATED OPTIC POLARIZER c74
S. Yuen, B. Syrett, W. Jiang (Canadian Marconi Co. Ltd., Montreal, Quebec.), J. Chrostowski (National Research Council of Canada, Ottawa, Ontario.), and J. Wartak (National Research Council of Canada, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A new type of integrated optical polarizer employs the antiresonant reflecting optical waveguide (ARROW) structure. The criteria for achieving optimal polarization extinction with these waveguide devices are discussed. Experimental results from testing of the prototype devices are then presented. Field distributions perpendicular to the core and cladding interfaces were analyzed using the transverse resonance method to arrive at the optimal ARROW structure. In addition, field confinement by the rib waveguide in the horizontal direction was examined using the effective index method. Excellent correlations between the theoretical and experimental beam profiles were obtained. Author (CISTI)

Yeung (Canadian Space Agency, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The conceptual and implementation aspects are presented for a cutaneous tactile sensor developed for the contact measurement of a local three dimensional object shape. Most of the available tactile sensing technologies measure the contact force transmitted through an elastic pad which contacts the object of interest. A force-sensitive array of strain gauges is used in an experimental 8-by-8 sensor array to provide a de facto two dimensional sampling of the continuous spatial field of the strain in the elastic pad. Each gauge also provides a quantization of strain intensity in the third direction of three dimensional space. The different functional steps in the sensing process were studied using the experimental tactile sensor array. The results show that the tested approach is robust and has a number of functional characteristics which favor further investigation for potential space applications. Author (CISTI)

DIVISION BY POLYNOMIAL MATRIX AND ITS APPLICATION TO MULTIVARIABLE LINEAR SYSTEMS c63
Jianguo Fu and N. K. Sinha *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The concept of division by a polynomial matrix is introduced and applied for solving a polynomial matrix equation that arises in applications such as the design of compensators for multivariable systems. It is shown that the proposed division by a polynomial matrix can be easily implemented on a computer, since this approach converts the operation on a polynomial matrix into an operation on a numerical coefficient matrix. This approach can also be utilized in the design of adaptive controllers for multivariable linear systems in the presence of uncertainty. Author (CISTI)

Some recent results are presented from the formulation of the classical linear quadratic regulator problem. The approach is based on direct optimization in the space of operators, thereby allowing constraints on the operator types and norms. It is shown that the constrained optimal regulators and optimum filters converge to the classical ones as the constraints are removed. In addition, some generalities and possible generalizations for filtering problem solutions are presented. As a bonus, the developed approach provides a simple and direct derivation of the Kalman-Bucy filter equations. For illustration, some numerical results are shown comparing constrained and unconstrained linear filters. Author (CISTI)

VIBRATION CONTROL OF FLEXIBLE SPACE STRUCTURES IN NOISY ENVIRONMENT c18
S. S. Lim and N. U. Ahmed *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Based on a dynamic model developed for large flexible spacecraft, a stabilizing control is designed which can suppress the vibrations induced by random perturbation. The problem considered is that of asymptotic stabilization in the presence of random disturbances by application of simple feedback controls. A flexible spacecraft consisting of a rigid body with a long flexible beam attached to it and undergoing three types of motion (rigid body translation and rotation, and beam vibration) is modeled. The results indicate that the feedback controls are robust with respect to the disturbances. Some numerical simulation results are also presented for illustration of the impact of random perturbation on the dynamic behavior of the system and the effectiveness of the suggested controls.

A SYSTOLIC-ARRAY STRUCTURE FOR MTCM RECEIVERS c33
S. H. Jamali and Tho Le-Ngoc *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Multiple trellis-coded modulation (MTCM) schemes, which represent a performance on the fading channels superior to the conventional trellis-coded modulated schemes, have a highly connected trellis diagram with parallel paths between states. Optimum detection of these schemes is achieved by the Viterbi algorithm (VA). For the schemes with a large number of states or parallel paths, this algorithm requires many computations during each symbol interval. Applications where the data rate is high necessitate a parallel processing implementation of the VA rather than the sequential solution. A highly concurrent implementation of the VA is proposed, based on systolic array processors for MTCM receivers. It is shown that the throughput rate gain of this systolic array decoder increases exponentially with the multiplicity of the MTCM schemes. This allows designing the MTCM schemes with higher multiplicities, with such schemes having more coding gain than the MTCM codes with smaller multiplicities.

AN ERROR CONTROL PROTOCOL BASED ON TRELLIS CODED MODULATIONS **c32**

Paul Ho and Yan Wu *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 6 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Instead of using binary forward error correcting codes for hybrid automatic repeat request systems, it is proposed to use joint power and bandwidth efficient trellis-coded modulations (TCM). Due to their bandwidth efficiency, error control systems using TCM can achieve much higher throughput, in the range of signal-to-noise ratios of interest, than systems using more conventional coding and modulation methods. By making use of the fact that rate-compatible TCM schemes can be obtained by periodically puncturing and/or repeating modulation symbols from a mother TCM scheme, the effective code rate, and hence the error correction capability, of the TCM subsystem can be varied by adopting a retransmission strategy that sends only incremental redundant symbols, and by adopting a decoding strategy that performs code combining. Such rate-adaptive hybrid error control systems are quite suitable for mobile radio application. Using analysis and computer simulation, the performance of three such systems was studied in a Rayleigh fading environment. The tradeoff of these systems, in terms of throughput, decoding complexity, and frame-error rate, is discussed. The system giving the best compromise among these three performance measures uses rate-compatible TCM schemes obtained from the Ungerboeck 8-state 8PSK code. Author (CISTI)

A SINGLE CHIP HIGH-SPEED CMOS VITERBI DECODER **c33**

David Peter Noel and Tad Kwasniewski (Carleton Univ., Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

To provide an improved coding gain at high transmission rates, a single-chip complementary metal oxide semiconductor (CMOS) Viterbi decoder was developed. A close examination of an implementation of error control coding utilizing the Viterbi algorithm as a method of improving forward error correction schemes has uncovered sub-circuits within most designs which could be modified for use at higher rates of operation. By capitalizing upon the strength of those portions of the various designs capable of high speed operation, an optimal high speed Viterbi decoder was then designed. The major sub-circuits modified for use in the optimal design are primarly the add-compare-select circuitry and the path memory as it exists in several of the reviewed designs. With the use of the 1.2 micron CMOS process, high-speed operations exceeding 100 megasymbols per second is achieved. The reduced-area technology permits the implementation to be placed on an individual silicon die. Author (CISTI)

QR DECOMPOSITION BASED LEAST SQUARES LATTICE ALGORITHM **c61**

Simon Haykin *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The QR decomposition provides a mathematical tool for the factorization of a rectangular complex-valued data matrix. Highlights are presented of a new algorithm, based on the numerically robust QR decomposition, for a fast recursive solution of the linear least squares problem. The algorithm has a lattice-like structure and its development is based on a hybridization of ideas. Three distinct elements may be identified in the new algorithm: initial values specified by the input data and desired response; order updates (recursions) for computing angle normalized estimation errors, including the adaptive filter output; and time update (recursions) for the direct computation of a corresponding set of auxiliary parameters. The new algorithm has operational and implementational advantages including fast rate of convergence, numerical stability, high level of computational efficiency, a modular structure, and an integral set of desired variables and parameters.

ENHANCED RESOLUTION AND DE-ALIASING TECHNIQUES FOR FAST FOURIER TRANSFORMS **c61**

G. D. Cormack and J. N. McMullin *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Improvements in fast Fourier transform (FFT) procedures for rapid spectral analysis of large sets of signal data are described. Final-value padding prior to FFT transformation of a steplike function, such as zero padding for a limited duration function, is found to increase the spectral resolution. In an example considered, a sixteen-fold enhancement is obtained. Frequency domain de-aliasing algorithms based on interpolative modeling between data points are presented and are used to remove aliasing error from FFT results. These algorithms are uniquely attractive because of their accuracy and their computational efficiency. The algorithms can be up to eight orders of magnitude more accurate than the ordinary FFT, even above the Nyquist frequency. The frequency domain de-aliasing method presented is also shown to be valid for increasing the accuracy of an FFT of a steplike data set. Author (CISTI)

THE USE OF DATA TURNING IN AIRBORNE RADARS **c32**

L. Lightstone and D. Faubert *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Data turning is a digital signal processing method that achieves good signal-to-noise ratio and target/interference resolution while reducing the number of pulses processed in the discrete Fourier transform/fast Fourier transform operation. A mathematical description is provided of data turning, along with a mathematical example of the impact of data turning on a bank of discrete Fourier transform filters. Data turning is discussed from the frequency domain and time domain perspectives, and a simulated performance example is taken from an airborne pulse doppler radar system. It is shown that data turning can, with a proper choice of signal processing parameters, approximate the integration improvement of non-coherent integration. Data turning can be significantly faster than either full coherent processing or non-coherent processing. Author (CISTI)

SYNCHRONIZATION OF THE LAPTV ADATIVE FILTER WITH INPUT STATISTICS **c33**

Heping Ding and Moustafa M. Fahmy *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1

and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A discrete-time linear, almost periodically time-varying (LAPTV) adaptive filter (AF) that admits the output modulator structure (OMS) was proposed for processing almost cyclostationary (ACS) signals. The problem of synchronization of this LAPTV AF with the input ACS signals is encountered in practical applications. An intrinsic frequency tracking scheme is proposed for synchronizing the LAPTV AF with varying input statistics. The tracking algorithm is presented and analyzed and it is shown that the algorithm converges if the step size (a positive constant controlling the rate of adjustment) meets specified criteria. Two simulations were performed to evaluate the transient and steady-state behaviors of the tracking scheme. It is concluded that the proposed scheme succeeds in keeping the LAPTV AF synchronous with the input statistics, with a controllable performance degradation. Author (CISTI)

FEATURE SEGMENTATION USING A MULTIPLE-STACK BASED CHAIN CODING ALGORITHM **c61**
Dan Ionescu and Michael A. Sasarman *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A new pixel labeling method is introduced for use in contour tracing in images with linear features, as a way to improve the performance of existing generalized chain codes. The proposed algorithm employs a multiple stack (MS) to track intersection points, referred to as T-joints, between blobs and lines in edge images. The stack mechanism is activated only in the presence of one-pixel-wide features. The MS algorithm is suitable for interpretation of aerial images where small features are quite frequent. The algorithm was implemented on a massively parallel architecture using LANDSAT multispectral images, and an example of analysis of an aerial test image is included. Author (CISTI)

AN ARCHITECTURE FOR AN ANALOG VLSI NEURAL NETWORK FOR EARLY COMPUTER VISION PROCESSING **c33**
D. D. Haule, M. E. Malowany, D. Lambidonis, S. Nemawarkar, S. Sayegh, and A. S. Malowany *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A two-stage early vision algorithm for curve description in images has been targeted for an analog very large scale integration (VLSI) implementation. Similarity between the processing in the two algorithm stages is exploited, resulting in a single modular chip capable of performing either processing stage. The core of the circuitry is a parallel convolution array modeled after connectionist artificial neural network structures. Pipelining of the image data is applied, using on-chip temporary analog storage to implement neighborhood operations. On-chip long-term analog storage for algorithm parameters is proposed using floating-gate electronically erasable programmable read-only memory technology. The chip, whose approximate transistor count is 15,000, is designed for a complementary metal oxide semiconductor (CMOS) 1.2 micron double-metal process. An effort is made to maintain the transistors in the subthreshold region of operation to decrease power requirements, particularly in the analog convolution array which forms the bulk of the chip and is of concern for scaling up the array size in the future. HIGH-SPEED, CMOS DUAL MODULUS FREQUENCY DIVIDER FOR RF FREQUENCY SYNTHESIS **c33**
Navid Foroudi and Tad A. Kwasniewski *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

With a trend towards integrating the radio frequency (RF) component of a mobile/satellite/indoor wireless transceiver into a single integrated circuit, the issue of high-speed, high resolution frequency synthesis becomes highly important. To achieve high resolution, a fractional division frequency divider can be used. A dual modulus frequency divider has been designed for a 3-micrometer CMOS process. The speed is enhanced by using a novel fast digital counter in a circuit in which only the first stage works with high frequency. Decoding hardware passes the division-ratio control signal to the first stage only during one of the states of the second stage, which is clocked by the output of the first stage. The proposed circuit configuration works with a single phase clock, which eliminates skew problems. After optimization, a simulation indicates that the circuit can operate with a frequency as high as 165 MHz. Author (CISTI)

LOGARITHMIC TIME SCALE IN THERMOGRAPHIC NON DESTRUCTIVE EVALUATION (NDE) OF MATERIALS **c38**
X. Maldague, J. C. Krapez (National Research Council of Canada, Boucherville, Quebec.), and P. Cielo (National Research Council of Canada, Boucherville, Quebec.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Active thermography is an attractive new technique for the nondestructive inspection of materials and structures. This technique uses a thermal perturbation to stimulate the response of the part being evaluated. Dedicated image processing is necessary to recover quantitative information about possible buried low thermal conductance defects. A technique is presented which allows recovery of the complete temporal history curve of the sample following the thermal stimulation, taking into account the typical limitations of digital systems both in terms of speed to capture images and available memory to hold them. The technique is based on the use of a logarithmic time scale to record the observational data. Such a time scale is shown to allow acquisition of infrared images over long periods of time without exceeding the computer memory capacity while retaining all the important features of the temperature history curve following the thermal perturbation necessary to detect low thermal conducting defects. AN INFORMATION THEORETIC APPROACH TO STOCHASTIC ADAPTIVE CONTROL APPLICATION TO MANIPULATORS WITH ACTIVE INERTIA **c63**
Guy Jumarie *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

An alternative approach is presented to tackling the problem of the control of stochastic systems, in which the control of the continuous plant itself is designed and then the effects of discretization in the computerized implementation are analyzed. To this end, the Fokker-Planck equation which defines the state probability density of the process is combined with some basic concepts of Shannon's information theory. A model reference adaptive control is suggested in which the cross-entropy between the actual system and the system to be tracked is minimized. The application of the adaptive control scheme to robotic manipulators is outlined. Author (CISTI)

AN ADAPTIVE CONTROLLER FOR A CLASS OF MIMO NON-MINIMUM PHASE SYSTEMS WITH DISTURBANCE REJECTION DESIGN **c63**
X. Li and C. R. Baird *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The problem of disturbances rejection in an adaptive controller design is addressed. A new adaptive control algorithm is derived to obtain the complete measurable disturbances rejection in both static and dynamic states for a class of non-minimum phase multiple-input multiple-output systems by reassigning the system zeros to the stable region. The controller design scheme incorporates three steps. First, the system model is modified

by using a control signal which takes two values during a sampling period. Then two precompensators are established to the decoupling end. Finally, the generalized minimum variance approach is applied to each decoupled loop, and the complete measurable disturbance rejection is achieved through the feedforward compensating. A simulated example is presented to demonstrate the performance of the proposed controller. Perfect reference following and complete measurable disturbance rejection are achieved at sampling instants after the estimated parameters converged.

ROBUST BOUNDARY CONTROL OF FLEXIBLE STRUCTURES GOVERNED BY HYBRID DYNAMICS **c18**
P. Li, N. U. Ahmed, and S. S. Lim *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The robust control and stabilization of a simplified spacecraft control laboratory experiment (SCOLE) model are analyzed. In this model, a long flexible mast or elastic beam joins two rigid bodies. Boundary conditions are imposed at one end by the control forces and torques acting on one body, with the other end at rest. A mathematical model is rigorously derived and it is shown that the vibrations in the flexible mast can be completely eliminated by applying appropriate feedback control forces and torques. Moreover, it is proved that the boundary feedback control is robust in the sense that the stability properties remain invariant under a broad class of perturbations by the same feedback law. Simulation results for the SCOLE model are also included. Author (CISTI)

A SLOTTED ALOHA SATELLITE CHANNEL SIMULATOR **c32**
D. Peter Noel and Arthur F. Guibord (Telesat Canada, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The task of developing a data communication system for mobile applications may be aided through the use of a customized simulator. By modeling the communications channel, the user population and traffic density may be optimized for peak performance under most conditions. A flexible slotted Aloha channel simulator, capable of customization to various channel configurations and user profiles, was developed as a flexible tool for analyzing the transient and steady-state performance of a multiple access network. The design of the simulator was based on the specifications associated with the satellite messaging protocol within the Telesat Mobile satellite data service. Sample simulation results are presented and analyzed, showing such phenomena as the effects of channel loading on queueing delay.

The application of the detection theory (DT) bound is developed for the symbol timing recovery problem. It is shown that this bound is particularly well suited to the symbol synchronization problem, and provides useful information in a wide variety of situations. The Cramer-Rao (CR) and DT bounds are compared for this application. In order to assess the comparative usefulness of the two bounds, a different form of the CR bound is first derived which is more applicable to the symbol timing problem than the usual statement of the CR bound. It is shown that the DT bound yields useful results for signaling pulses with jump discontinuities and for small signal-to-noise ratios. In addition, the DT bound provides information about the variation in performance achievable for different symbol sequences. In contrast, the CR bound gives no useful information about any of these three cases. Author (CISTI)

The design and analysis of digital microwave radio systems employing antenna pattern/angle or space diversity to combat multipath fading requires knowledge of the channel characteristics for each diversity branch. A method is described for deriving the statistical channel models for each diversity branch in any line-of-sight microwave link. The method is based on statistically modeling the link's atmospheric refractivity profile so that, by using ray tracing techniques to estimate the received raypath parameters for each profile, and including the effects of the diversity antenna patterns, an ensemble of channel responses can be formed for each diversity branch. Performance factor distributions could then be computed and used to find the optimum diversity antenna patterns, as well as to estimate outage, for a particular link. Author (CISTI)

ACOUSTO-OPTIC TIME-INTEGRATING CORRELATORS FOR PROCESSING WIDEBAND DIGITAL DATA **c74**
N. Brousseau and J. W. A. Salt *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The development of high quality optical components has made possible the implementation of high performance optical data processors of many kinds. The research on time integrating correlators (TIC) performed at the Defence Research Establishment Ottawa is described. TIC's are acousto-optic data processors designed to produce at high speed the cross correlation between any two input signals. The principle of operation of TIC's is briefly reviewed and the characteristics of the signal that they produce are discussed. Three implementations being currently developed are presented together with an analysis of the factors affecting the performance of TIC's. TIC's are characterized by a sensitivity comparable to that of a radiometer and by processing speeds on the order of 10 to the 12th operations per second. Their dynamic range is usually limited by the dynamic range of the detector array. TIC's correlating two signals of different intensity have demonstrated a dynamic range of 43 dB in a system having a time-bandwidth product of 180,000. Author (CISTI)

ZERO-CROSSING RATE OF SOME NON-GAUSSIAN PROCESSES **c64**
John Barnett and Benjamin Kedem (Maryland Univ., College Park.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

It is a curious fact that the formulae for the expected zero-crossing rate of some non-Gaussian processes may be obtained using monotone transformations of Gaussian processes. This is shown using two different techniques. The first technique involves the derivation of the expected zero-crossing rate for discrete time and then extending the result to the continuous time case. The second is a direct method that makes use, successively, of Price's theorem, the chain rule, and Rice's formula. The two methods should prove useful for the general level-crossing problem of a variety of random processes. Author (CISTI)

ANALYTICAL PREDICTIONS OF THE INTERMODULATION NOISE OF SEMICONDUCTOR LASER DIODE **c36**
Tapan Biswas and W. F. McGee *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Theoretical models for semiconductor laser diode nonlinearities are investigated. Volterra transfer functions are calculated from the laser rate equations using an output-to-input approach. Nonlinear models for second harmonic, third harmonic, and two-tone third-order intermodulation distortions are calculated from the Volterra transfer functions. Variations of distortion level with frequency and bias are shown along with previously published theoretical, simulation, and experimental results. The advantage of the approach presented is that it offers a more general analysis framework and an accurate rapid evaluation of the device performance.

Dynamic complementary metal oxide semiconductor (CMOS) circuits have been a privileged target for the optimization of characteristics such as speed, area, and power dissipation. Research was conducted to reduce the delay of classes of CMOS logic circuits by inserting a parallel regenerator at specific nodes. The new design method presented is shown to reduce the delay by as much as 80% and the delay-area product by up to 35%. Results of different circuit simulations using the HSPICE simulator, assuming Northern Telecom CMOS3DLM technology parameters are summarized.

Fault tolerance and testing for wafer scale integration (WSI) processor arrays using boundary scan and built-in self-test (BIST) technology are discussed. A test strategy for verification of all components within an integrated circuit wafer is presented, and a fault tolerance technique using semi-concurrent fault detection is described. The test strategy consists of four steps taken to verify test bus continuity, boundary scan register continuity, interconnection network connectivity, and processor element integrity. The component-level area overhead for boundary scan and BIST is modest for present-day fabrication processes, and will diminish to an insignificant level as integrated circuit fabrication technology continues to improve.

GENERATION OF CONFIGURABLE SELF-SYNCHRONIZING SYNCHRONOUS CMOS STATIC RAMs **c60**
W. Kinsner *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p
(For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A new configurable self synchronizing synchronous complementary metal oxide semiconductor static random access memory is described. A new memory generation approach has been developed that results in memories of any bit size. The memory is limited in size only by physical considerations. The memory generator not only produces a layout that can be used directly in any physical location in the design of application specific integrated circuits, but also generates data bases for the desired memory simulation in order to verify its actual timing to be used in the rest of the design. A self synchronizing memory architecture has been selected to assure the worst-case timing with temperature variations, process variations, and aging of each memory generated. The memories can be implemented in either a two dimensional or a two and one-half dimensional architecture.

A NUMERICAL SIMULATOR FOR TESTING SLIDING MODE CONTROLS IN STOCHASTIC SYSTEMS **c64**
P. Gauthier and R. P. Malhame (Ecole Polytechnique, Montreal, Quebec.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Hybrid stochastic models can be used to characterize the stochastic behavior of a great variety of systems which have a discontinuous character or follow a jump process. One of these systems is the stochastic variable structure controller. A mathematical model of such a controller is outlined, in which the system dynamics is completely specified by a vector of the usual continuous state and the discrete state. The discrete variable characterizes the structures between which the process oscillates to create a nonideal sliding mode. It is shown that the evolution of the probability density functions in each of these structures can be described by a system of coupled Fokker-Planck equations. Using a finite difference approximation, a numerical simulation of the resulting system of partial differential equations has been constructed. The invariance properties in a sliding mode in the presence of noise are evaluated. The simulations suggest the possible existence of a Riccati type equation for the propagation of covariances which would extend in a certain way the well-known invariance properties of deterministic systems in sliding modes to the second moments of the state dynamic probability distribution.

ANALYSIS AND SIMULATION OF A TWO DEGREES-OF-FREEDOM ONE-LINK FLEXIBLE FOREARM **c37**
J. C. Piedboeuf and R. Hurteau (Ecole Polytechnique, Montreal, Quebec.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 6 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Reliable models are necessary to study flexible robots. A nonlinear model for a two degrees of freedom robot with a flexible forearm is presented. Both a continuous form and a discrete form of the model are given. The flexibility of the link is represented along three planes: horizontal, vertical, and longitudinal. Nonlinear phenomena such as Coriolis and centrifugal forces, and the coupling between horizontal and vertical deflections are clearly illustrated. A simulation program termed E.S.A., developed to analyze the model, has allowed the nonlinear model to be studied, analyzed, and compared to the linear one. Two terrestrial robots and a robot configured to operate in space were analyzed. A criterion has been defined and a rule is proposed to determine whether the nonlinearities have to be taken into account or not. This rule indicates the angular speed at which a divergence of more than 5 percent will be observed between the nonlinear and the linear models. Small amplitude phenomena were also investigated, such as the coupling between the rigid and flexible modes and the coupling between the deformation due to the payload.

A PARALLEL PROCESSING SYSTEM FOR INTENSIVE I/O **c62**
Sylvain Martel, Serge Lafontaine, and Ian Hunter *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A computer for controlling a high performance micro-robot has been developed. The interprocessor communication scheme as well as the programmable input/output (I/O) subsystem constitute the main characteristics of this loosely coupled system with minimum interprocessor communication overhead. To achieve a high throughput, the major bottlenecks encountered in other systems have been reduced significantly. The general architecture allows large bus bandwidths and guarantees fast response time to asynchronous external events that must be dealt with in real time. The main features include memory, cache, I/O channels, and the interfacing procedure to various types of analog to digital and digital to analog converters, serial ports, timers, expansion ports with programmable lines, and network interface. The system allows simple implementation of free-running or computer controlled modes for analog to digital converters. The multiprocessor facilities provide interprocessor signalling, arbitration, synchronization, multicast transfers, burst accesses, and avoidance of communication deadlocks. Bus sharing is also possible. Pipelined and master/slave configuration strategies are available for obtaining maximum throughput for distributed real-time processes in this computer. Tools including macros and system calls are provided to help the programmer extract maximum performance from the system. Author (CISTI)

A TRANSPUTER BASED PARALLEL PROCESSING ARCHITECTURE FOR ROBOTICS APPLICATIONS **c62**
Akilesh Parameswar and Naresh K. Sinha *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Calculation of inverse dynamics renders robot control schemes computationally intensive. Practical implementation of these schemes requires stringent real-time constraints to be satisfied by the processing hardware. A new computer architecture is presented which makes possible high sample rate controllers. A parallel processing system, based on the INMOS transputer, is proposed. The transputer is a 32-bit processor desiged to be a building block of parallel processing systems, and is ideally suited to robotics applications. The architecture is based upon a data flow decomposition of the inverse dynamics algorithm with calculations being performed in a pipelined fashion. The proposed design yields high performance at low cost. Author (CISTI)

SAW TECHNOLOGY FOR ON-BOARD PROCESSING IN MILITARY SATELLITE COMMUNICATIONS **c32**
Alastair Malarky and Michael Shaw *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Military satellite communications require onboard signal processing and highly directive antennas to reduce the risk of jamming. Elements of signal processing include frequency hopping over wide bandwidths, sophisticated coding, and robust modulation techniques. Surface acoustic wave (SAW) devices are ideally suited to carry out some of these onboard processing functions. The work being carried out on low and medium data rate processing for application in the Canadian extremely high frequency SATCOM program is reviewed. It is shown how SAW technology is capable of meeting many requirements for onboard processing in military communications. SAW devices are designed in the time domain and are best described as finite impulse response filters. They have applications as time delay devices, matched filters, and dispersers for frequency discrimination and block demodulation. The block demodulation capability is based on the use of a SAW chirp-Z Fourier transform (CFT), and the CFT response characteristics of SAW devices are noted. Advantages of SAW devices for onboard applications include small size, ruggedness, insensitivity to radiation, stable characteristics over a range of temperatures, and inherent reliability. COMPARISON OF DIVERSITY COMBINING, INTERLEAVING, AND DECODING TECHNIQUES OF A SCINTILLATED CHANNEL **c32**
R. Yang and P. VanMinnen (COM DEV Ltd., Cambridge, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The effectiveness of convolutional coding, various diversity combining schemes, interleaving, and non-coherent frequency shift keying (NCFSK) / differential binary phase shift keying (DBPSK) schemes in a scintillated channel is evaluated. The scintillation process is assumed to be Rayleigh distributed, and the process under consideration is that caused by a high altitude nuclear detonation in the ionosphere which may especially affect the signal propagation in a satellite communication system. Bit error probability calculations are presented for the various schemes. It is concluded that the performances of frequency hopping (FH)/DPSK and FH/NCFSK systems are similar. With the interleaver placed after the diversifier, linear combining and soft-decision Viterbi decoding are the best options for combatting scintillation. In FH/NCFSK, a suboptimal configuration is the substitution of the linear combiner by a nonlinear combiner, where the nonlinear combiner performs envelope detection normalized by the sum of the voltages at the outputs of the tone detectors. A SATELLITE DOWNLINK SPREAD SPECTRUM TIMING BEACON **c32**
W. R. Seed, J. L. Pearce (Defence Research Establishment, Ottawa, Ontario.), and J. S. Wight (Carleton Univ., Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The design and laboratory performance of a satellite downlink spread-spectrum timing beacon is discussed. The timing beacon is required to provide the users of a multiple-access system with a highly accurate timing reference. A 300 bit per second data signal, comprised of satellite timing and orbital ephemeris information, is spread using a 1 MHz clocked direct-sequence pseudonoise code. By synchronizing the receiver to this sequence, the user has access to a 1 microsecond duration timing mark. Code acquisition is achieved using serial search synchronization techniques. A one-chip delay-locked loop, having a loop filter bandwidth reduction circuit for transition from acquisition to track mode, is used to track and despread the received signal. A squaring loop with frequency searching and lock detection is used to provide coherent data demodulation. The ability to achieve better than a 1-microsecond timing accuracy and an uncoded error rate below 0.00001 for input signal-to-noise ratios below minus 20 dB is demonstrated. Author (CISTI)

FASSET: A DEVELOPMENT MODEL FOR A CANADIAN EHF MILSATCOM SYSTEM **c32**
Gary Boudreau and R. J. Keightley (Defence Research Establishment, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

FASSET (Functional Advanced Development EHF SATCOM System for Evaluation and Test) is an advanced development model of an extremely high frequency (EHF) military satellite communication system or SATCOM. The model will be employed by the Canadian Department of National Defence to demonstrate and evaluate the capabilities of the EHF SATCOM for Canada. As part of the Canadian EHF SATCOM Research and Development Project, FASSET will develop the concepts and technology that would be required in any future operational EHF military SATCOM system. The present effort was preceded by several phases of extensive analysis and study to define and specify the system. FASSET is a ground-based facility that consists of two functional Advanced Development Model (ADM) ground terminals and a functional ADM communications payload along with associated equipment necessary to emulate various satellite system configurations under a variety of channel conditions and jamming threats. The capabilities of the FASSET facility are described, including communication at low data rates (75-19,200 bits/second) and medium data rates (32,000 to 1.544 million bits/second) and synchronization of the system in both acquisition and tracking processes. MODELLING AND SIMULATION OF HUMAN RETINAL VISION PROCESSING **c52**
Philip J. Scheltens, Andrew H. Rawicz, and Marek J. Syrzycki *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Examination of biological vision processing systems has been used to develop a model of retinal vision processing. The model features differently sized photoreceptors with programmable light adaptation and lateral interaction mechanisms. Each specific effect can be invoked by a proper choice of model parameters responsible for static and temporal rod response, lateral inhibition, scaling of bipolar summation, and filter kernel size. This model has been simulated in various illumination conditions, producing outputs that resemble psychophysical results with human vision such as Mach bands. The model and its algorithms were found useful for performing such image processing tasks as image deblurring, edge enhancement, and edge extraction. Author (CISTI)

QUANTIZATION EFFECTS IN SEGMENTATION OF RANGE IMAGES **c61**
Troy L. Yee and Kamal Kant Gupta *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

With recent developments in range imaging systems, considerable research effort has been devoted to acquiring three dimensional models from range images. A project has been undertaken with the objective of developing theory and implementing algorithms for decomposing complex surfaces into meaningful parts. Some preliminary results are presented on segmenting range images into meaningful entities, or surface patches representing certain invariant characteristics (derived from differential geometric properties) of the surfaces in the image. A segmentation algorithm proposed by Besl (1988) has been implemented in the C language for running on Sparc stations under the UNIX operating system. A brief overview of Besl's method is given, assessing its sensitivity to quantization error. Testing of the algorithm on a simple synthetic image has shown that reasonable surface segmentation can be obtained at a substantial cost in computing time. A higher resolution in range values in the devices which generate the range images is required; this would reduce the quantization errors and thereby, improve surface segmentation and reduce computing time. RECURSIVE-BATCH ESTIMATION OF STRUCTURE AND MOTION FROM STEREO IMAGE SEQUENCES **c74**
Juyang Weng and Paul Cohen *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Using long stereo image sequences, a recursive-batch approach is used to fuse multiple stereo views. The objective of this recursive-batch approach is to achieve higher performance without suffering from excessive computational cost. The information about the object structure is preserved from one image frame to the next, and it is refined recursively. The structure is represented in a camera-centered and a world-centered coordinate system. The former is useful for continuous navigation and the latter for visual map generation. In the presence of noise, the expected accuracy is provided together with the estimated solutions. With this recursive-batch method, the estimated motion trajectory closely tracks actual motions and it has eliminated the long divergence time period, which typically covers about 20 to 30 image frames, with a conventional Kalman filtering method. A SINGLE BAND PROCESSOR FOR THE COMPUTATION OF RANGE FROM OPTICAL ABSORBANCE **c74**
Paul Fortier, Denis Laurendeau, Stephane Morin, and Louis Begin *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A single-board processor for the computation of range data from optical absorbance is presented. The concept of range from optical absorbance is reviewed and the architecture adopted for efficient computation of range is detailed. The processor is based on a Texas Instruments TMS32020 programmable digital signal processor chip and is interfaced with a host microcomputer. The processor serves to calibrate the system and to compute the illuminance ratio required to calculate the range. The host computer is responsible for the overall control of the system, graphic display of the range maps, and interface with the user. A 256-by-256 pixel range image is obtained in less than one second using the processor. Author (CISTI)

A NEW WAY TO USE FUZZY SETS IN IMAGE SHARPENING **c61**
Yiming Yu and Eddie R. Fowler *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The concept of fuzzy sets has been applied to digital image processing, especially image enhancement. It has been shown that fuzzy set theory can be advantageously applied in image enhancement techniques because the theory is capable of describing and analyzing vagueness of objects in an image. However, in most of these applications, the images are always interpreted the same way into their fuzzy property domains. This type of interpretation is much like normalizing gray levels in image which is an inadequate procedure for image sharpening. A new way to define images using fuzzy sets is provided, in which the image definitions do not have to be the same everywhere. For different image processing purposes, different definitions of images using fuzzy sets can be selected for better results. The new definition procedure is more appropriate for image sharpening and an algorithm for implementing this approach is listed. The performance of this algorithm in image sharpening of three standard images is compared to that of the De and Chatterji (1988) fuzzy set approach and shown to yield more image contrast with less computational time. Advances in airport security technology based on the guided radar principle are reviewed. Such technology utilizes very high frequency radio waves, optimal for detection of human intruders in terms of radar cross-section. The Rapidly Extendible Perimeter Line Sensor uses a discrete wave coupling device as the sensing element. The system incorporates a pair of externally attached transmit/receive inductive couplers at opposite ends of a single conductor. For installation, the cable is unwound and clipped to support poles, with transmit and receive couplers at either end of the desired detection zone. A dual magnetically coupled slow propagation attenuating cable has been designed to provide its own attenuation of external modes of propagation, and both the transmit and receive coaxial components are contained within the same jacket. The cable can be used either in buried or surface (relocatable) modes. The Area Illuminated Leaky Cable Sensor is a variant of the leaky cable technology intended to secure a number of individual resources located in a cluster arrangement. The Tactical VHF/Volumetric Surveillance Radar provides volumetric (surface and overhead) coverage using send and receive antennas which can be configured according to the zone needing protection. The antennas can be mounted on buildings or aircraft, or can be portable types for fast temporary setup of a security perimeter. Author (CISTI)

AUTOMATIC DETECTION OF EXPLOSIVES USING X RAY IMAGING **c03**
David Schafer and Martin Annis *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Backscatter imaging has been developed as a new technique for the x-ray imaging of checked baggage. In the scatter image, the contrast for explosives in an image is dramatically increased and the image confusion is decreased. An explosive detection system is being developed based on measuring the bulk x-ray characteristics of scatter images of checked baggage. In the simplified version of this system, it is proposed that normal checked baggage as a group has rather similar scatter characteristics. To test this hypothesis, bags from a lost-baggage agency were obtained and measurements were made of their scattering characteristics. Several simulated bombs were added to some of the bags and the changes in the characteristics were used to develop an automatic detection algorithm. Preliminary results show that the system was able to detect 2.3-pound bombs 100% of the time with only a 2% false alarm rate, and to detect 80% of 0.7-pound bombs at a similar false alarm rate. EXPLOSIVES DETECTION SYSTEMS FOR AIRPORT SECURITY GAS CHROMATOGRAPHIC BASED DEVICES **c03**
S. Nacson, C. Castledine, T. Siu, T. Lu, and O. Legrady *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A high-speed explosive vapors monitoring system has been developed which is suitable for use at an airport security gate for detecting the presence of explosives on passengers and in baggage. The system consists of a rapid vapor concentration manifold, an explosive vapor preconcentrator, and a fast gas chromatograph/electron capture detection system. Different configurations of vapor concentration manifolds are used for examination of passengers and of baggage. The system was tested in two months of full-scale trials at a throughput of 7 passengers or bags per minute. An alarm rate of about one in a thousand for the walk-through unit and two in a thousand for the baggage unit were recorded. The system has shown exceptional sensitivity to explosive vapors, being capable of detecting less than 5 parts per trillion of ethylene glycol dinitrate at a low rate of false alarms. Author (CISTI)

ADVANCED SIGNAL PROCESSING REQUIREMENT IN AN ION MOBILITY EXPLOSIVES DETECTOR **c25**
R. Jackson, J. Davies, L. Daubner, L. D. May, and S. Wiles *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Ion mobility spectroscopy (IMS), also called plasma chromatography, can be used to detect trace quantities of explosives in the presence of many other materials and natural interferents. IMS offers significant practical advantages over many other techniques used in airport security systems, including near real-time detection, good specificity and excellent sensitivity, no health hazard, simplicity of operation, comparatively light weight, and low cost. The principles of IMS are discussed along with the methods of processing IMS signals. The identification of the respective analytes by calculating analyte drift time, and the assessment of half-widths of pulses for both the target and background ions, present a challenge to signal deconvolution and processing. Algorithms have been developed to maximize signal abstraction from varying backgrounds. The use of algorithm-based processing greatly reduces false alarm rates which otherwise would seriously degrade the usefulness of the detection system. Author (CISTI)

TASK ALLOCATION AND REAL-TIME CONSIDERATIONS FOR THE ROBOT CONTROLLER TEST STATION (RCTS) **c63**
R. Allard, M. A. Ramsay, and M. M. Bayoumi *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The Robot Controller Test Station (RCTS) developed at Queen's University has emerged as a valuable tool for testing and integrating control and sensing schemes within a complete robot environment. RCTS is based on a modular approach that is both flexible and easy to use and modify. The system also features a menu interface and analysis functions for monitoring purposes. Version 2 of RCTS features an expanded communication system giving the ability to share the computing workload among several processors. The efficient allocation of software partitions to the different processors then becomes important. The goal is to choose a configuration permitting an optimal utilization of the computing resources. Once the user proceeds with the implementation, the fine tuning of real-time parameters may take place using the menu interface. The allocation model also gives a crude indication of the amount of excess computing resources available. The real-time constraints within RCTS are exposed and an allocation algorithm is developed. The algorithm produces an optimum solution, providing the number of processors is kept small. It takes into account transient loads as well as precedence relations between the modules. The method may be generalized to other periodic systems, particularly in robotics. Author (CISTI)

ON ANALYTICAL PERFORMANCE MODELLING OF SOFTWARE FOR DISTRIBUTED SYSTEMS **c61**
D. C. Petriu, C. M. Woodside, J. E. Neilson, and S. Majumdar *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Specific issues of software modeling for performance evaluation are addressed, such as the abstraction process necessary to build manageable performance models, the difference between the abstract representation of

software for development purposes and for performance analysis, the ability of various modeling techniques to capture relevant features of concurrent software, and the use of analytical performance models in the software development process. Three analytical modeling methods are compared from the point of view of their capability to model software for distributed systems, emphasizing their strengths and shortcomings. The methods are queueing networks, Petri nets, and stochastic rendezvous networks.

For loosely-coupled and synchronized parallel systems, a new mathematical formulation is proposed to minimize the maximal processor computation time and the maximal interprocessor communication time. For this partitioning problem, an equivalent multiobjective zero-one quadratic programming formulation is developed. A two-phase heuristic algorithm bounded in polynomial time is presented for solving the problem. Some comparisons of this algorithm with those in the literature for different graph partitioning problems are given. The computational results for a set of random problem instances are provided for evaluation. Author (CISTI)

COARSE SYNCHRONIZATION IN AN EHF FREQUENCY-HOPPED SATELLITE COMMUNICATIONS SYSTEM **c32**
S. J. Simmons and P. Lamers *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A study is presented of the problem of users first attempting to synchronize their M-ary frequency shift keying (FSK) transmissions to the dehopper of a signal processing satellite in a multi-user frequency division multiple access frequency hopped extremely high frequency satellite system. A simple and robust scheme is examined, based on using one of the FSK tones as a sync probe, comparing its energy to that seen in M-minus-one other tone bins during each hop. Multi-tone jamming is considered, at signal/jamming ratios of 0 dB and higher with background noise. It is shown that coarse sync alignment to within a fraction of a hop period can be reliably established for all but the very highest jammer powers (larger by the full processing gain). The resulting average time to acquisition is on the order of 0.5 to 2 seconds. Author (CISTI)

SECURITY OF THE REMOTE CONTROL LINK OF ANIK E SATELLITES [SECURITE DU LIEN DE TELECOMMANDE DES SATELLITES ANIK E] **c32**
Michael J. J. Drapeau *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p In FRENCH (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The consequences of the loss of communication capability of a communications satellite in Canada would probably be catastrophic. It, thus, becomes important to protect the satellite system against any organization which is or could be hostile. A preliminary study has been initiated with the objective of determining the main threats to the Anik C and D satellites and to define the possible measures which could minimize their effects. It is concluded that the remote control links of the new generations of satellites must be protected against intrusion and jamming. Consequently, an agreement has been reached with Telesat Canada to encode the remote control links with the Anik E satellites and to transmit using a narrow beam directed only towards a restricted number of terrestrial control stations. Telesat will also engage in improving the security of its infrastructure and to ensure that the entire ground-based control and location system for the satellite will incorporate a sufficient degree of redundancy.

CODING FOR FREQUENCY HOPPED SPREAD SPECTRUM SATELLITE COMMUNICATIONS **c32**
Qiang Wang, Vijay K. Bhargava, T. Aaron Gulliver (Defence Research Establishment, Ottawa, Ontario.), and Ian F. Blake (Waterloo Univ., Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Fast frequency hopped M-ary frequency shift keying (FSK) has drawn great attention recently due to its practicality. In such systems, the use of error correction coding and diversity has been shown to be very effective against jamming. A comparative view is presented of the system performances based on two different assumptions: a fixed data rate and a fixed hop rate. It is shown that while under partial-band noise jamming there is little difference in the system performances under those two assumptions, there is a significant difference when the jamming is multi-tone. Specifically, due to multi-tone jamming, a fixed hop rate system has an optimum M for M-ary FSK which is monotonically increasing with the ratio of energy-per-hop to jamming spectral density (Eh/Jo). Furthermore, if a coding system has a parameter related to M such as a dual-K code, optimum choice of the parameter value is also related to the optimum M and thus, Eh/Jo. For a fixed data rate system, the optimum K is either 2 or 3, depending on the coding scheme but not depending on the signal to jamming ratio. Author (CISTI)

ADAPTIVE JAMMER NULLING IN EHF COMMUNICATIONS SATELLITES **c32**
Jai Bhagwan, Stephen Kavanagh, and J. L. Yen (Toronto Univ., Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A preliminary investigation is reviewed concerning adaptive null steering multibeam uplink receiving system concepts for future extremely high frequency communications satellites. Primary alternatives in the design of the uplink antenna, the multibeam adaptive nulling receiver, and the processing algorithm and optimization criterion are discussed. The alternatives are phased array, lens or reflector antennas, nulling at radio frequency or an intermediate frequency, wideband versus narrowband nulling, and various adaptive nulling algorithms. A primary determinant of the hardware complexity is the receiving system architecture, which is described for the alternative antenna and nulling concepts. The final concept chosen will be influenced by the nulling performance requirements, cost, and technological readiness. Author (CISTI)

TEMPORAL SYNCHRONIZATION OF FREQUENCY HOPPED DPSK **c32**
W. R. Seed *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The downlink temporal synchronization strategies for a frequency hopped differentially encoded phase shift keying (FH/DPSK) signal are examined. Arguments are presented to support the concept of a burst distribution of sync hops, or 13-bit encoded hops used only for synchronization. The burst distribution is shown to provide a favorable tradeoff between input signal-to-noise ratio and probability of a false alarm. The synchronization process, which includes acquisition, verification, and track modes is reviewed. Envelope detection of the dehopped signal is used to provide an indication of initial acquisition as well as a coarse timing estimate of the sync hop time-of-arrival. The sync hop is also quadrature detected to verify the presence of the sync hop and to provide a fine timing estimate accurate to within a small fraction of a data bit. Simulations of the coarse and fine root mean square timing estimate error are shown to approach the theoretical lower bounds. Author (CISTI)

APPLICATIONS OF DIGITAL 3-D IMAGING **c61**

M. Rioux *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 10 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The technology and applications of digital three dimensional (3-D) imaging are reviewed. Its advantages over two dimensional imaging are discussed. Current applications under development are presented, mainly in the fields of robotics and dimensional inspections. Digital 3-D imaging possesses some unique features. Among all the imaging systems, only digital 3-D provides the data useful to make a direct copy of an object using numerically controlled milling or stereo lithography. In addition, 3-D views of a scene or object can be reconstructed from a single image transmitted over a communications link. Another feature is the absence of scaling effect (or apparent size) with distance from a 3-D camera; this is a highly desirable feature for machine vision. Future applications are suggested, including automated vision for the Freedom space station, protection of high security areas, and traffic volume monitoring. Author (CISTI)

A ROBUST MULTI-OPERATOR 3-D EDGE DETECTION APPROACH FOR RANGE IMAGE SEGMENTATION **c61**

Marc Soucy and Denis Laurendeau *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

An approach is presented for detecting and locating occluding contours and surface orientation discontinuities. Several directional operators with complementary characteristics are computed on the whole image. Local maxima of these operators are extracted and thresholded automatically. Then four directional edge maps are obtained through structured matching. These maps are finally merged by a local weighted averaging technique based on a metric that measures the quality of directional edge information. Experimental results obtained from a synchronized geometry range finder demonstrate that the proposed edge-detection approach is very efficient. All major edges of the objects are detected while spurious edges were eliminated. Author (CISTI)

RECOGNIZING PARTIALLY OVERLAPPING OBJECTS **c61**

Tayeb Damerji, Badreddine Karoui, and Dan Ionescu *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A model-based vision system that uses the parameters of an autoregressive model as features to model local sub-parts of the boundary is presented. A decomposition algorithm detects sub-parts of one object, when the object is not occluded, and sub-parts of the boundaries of different objects in the case of occlusion. The autoregressive model parameters representing the detected sub-parts are matched to features of known sub-parts according to the hypothesize verify paradigm. In order to reduce the recognition time, a pruning phase is added to eliminate obvious mismatches. The recognition process ends when all of the sub-parts in the scene are identified. Author (CISTI)

RADIATED FIELDS FROM AN ELECTROMAGNETIC PULSE SIMULATOR [CHAMPS RAYONNES PAR UN SIMULATEUR D'IMPULSIONS ELECTROMAGNETIQUES] **c32**

M. Pelletier, G. Y. Delisle, and S. Kashyap (Defence Research Establishment, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p In FRENCH (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Simulators of electromagnetic pulses allow generation within a limited time of very high-intensity fields such as those produced in a nuclear explosion. These fields can be radiated out of the test zone at a lower but nevertheless significant level; if the intensity of these fields is sufficiently high, damage to humans and electronic equipment can result. An evaluation of the potential danger of these simulator emissions requires knowledge of the amplitude, duration, and the energy of the radiated impulses. A technique is presented for calculating the fields radiated by a parallel-plane electromagnetic pulse simulator. The same method can also be applied to a rhombic type simulator. Sample numerical results are presented along with the calculations of the energy and power density and a discussion of the formation of the field in the frequency domain. Author (CISTI)

MODELS FOR PERFORMANCE ASSESSMENT OF HF ANTENNAS ON THE CH-135/TWIN HUEY HELICOPTER **c32**

Stanley J. Kubina and Shahram Esfandiari *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The performance of two practical radio-antenna designs for the Bell CH-135 helicopter was evaluated by developing wire-grid models for moment-method modeling of the corresponding radiating system. The first model evaluated a tranline antenna, with the rotor lined up along the helicopter's length. The second model involved a zig-zag antenna with the rotor in the same position. Other models were developed for the same two antenna types with the rotor blade at different positions. The validity of each model was assessed by comparing the computed radiation patterns with scale-model measured patterns, and by comparing the high-frequency assessment parameters. The effect of rotor modulation on these parameters is discussed. Computer model validation for shorted loop antennas was achieved throughout the 2-30 MHz range. Author (CISTI)

TRANSIENT FIELD COMPUTATIONS WITHIN OR PROXIMITY OF COMPLEX STRUCTURES: FD-TD APPROACH **c32**

W. A. Chamma and L. Shafai *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The effects of impulsively excited electromagnetic bursts, resulting from lightning or nuclear explosions on electronic equipment have raised interest in electromagnetic transient field penetration and coupling into complex structures. A numerical technique in which the Maxwell equations are solved using the finite difference time domain technique is presented for computing the transient response of a sphere illuminated by a Gaussian plane wave. Results are compared with the corresponding Rayleigh-Mie analytic solution and showed good agreement. The field penetration and frequency response of open-top conducting boxes was also explored. The addition of a lossy material on the top of one of the boxes was shown to reduce the field magnitudes inside the box. Author (CISTI)

COMPUTER-AIDED MODELING FOR ANALYSIS OF ARBITRARY SCATTERERS AND FEEDS **c32**

H. Moheb and L. Shafai *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Surface integral equations are formulated to relate the radiation and scattering fields of primary feeds and scatterers to the current distributions on their surface. These currents are determined by reducing surface integral equations to a matrix equation via a moment method. The computed currents are utilized to determine the co-polar and cross-polar fields of feeds and the far field of the scatterers. The technique is subsequently applied to study the radar cross-section of complex geometries such as conducting and dielectric spheres, finite cylinders, cubes and prisms, as well as to the rectangular waveguides representing an antenna problem. The developed method is general enough to handle various antenna and scattering problems and to generate solutions with a high degree of accuracy. Author (CISTI)

AN IMPROVED MODEL-CREATION PROGRAM FOR EM INTERACTION ANALYSIS **c32**

S. Kashyap, M. Dion, and A. Louie *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Several codes are available for computation of the interaction of electromagnetic waves with simple and complicated structures. All existing codes require as an input the geometry of the object under study. This geometry is supplied as a wire-grid, surface-patch, or cell model, depending on the simulation code. The difficulty of creating such geometric data increases with the complexity of the structure, as is the case with aircraft. To aid in this process, the DIDEC program was created, starting as a program that created wire models using a digitizing tablet. Initially, it created Numerical Electromagnetic Code input files for wire-grid structures. Since then, it has developed into an interactive program, DIDEC/DREO, for designing wire-grid, patch, and cell models of complex structures for solving electromagnetic interaction problems. The various features of the current version of DIDEC/DREO are described, with examples provided of graphic displays. Author (CISTI)

STAND ALONE LIGHTNING DETECTION EQUIPMENT USED AT CANADIAN FORCES AIR BASES **c47**

Pierre Pommainville and Robert Cross (National Defence Headquarters, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Stand alone lightning detection systems were installed at 15 Canadian Forces air bases across Canada and in Germany. The basic operation of this system is explained. The detection process begins when the large electric currents associated with the lightning return stroke radiate radio frequency energy. Incoming signals are analyzed by discrimination logic circuits, and the direction and range of any lightning signals are computed. A display screen shows the number of lightning flashes within the last 15 minutes in each of a number of radially partitioned segments in the surrounding area of the detection station. A case study of the operational use of the system is presented, revealing its advantage as an observational tool that fills the gap between the relatively large-scale resolution of meteorological satellite imagery and that of small-scale local weather reports. As a result of experience with the system, changes to the display output are currently under investigation to enhance the usefulness of the system as a local thunderstorm warning device. STRATUS: A PROTOTYPE EXPERT ADVISORY SYSTEM FOR TERMINAL WEATHER FORECASTING **c47**

Michel C. Desmarais, Fances deVerteuil, Denis Jacob (Atmospheric Environment Service, Saint-Laurent, Quebec.), and Peter Zwack *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The methodology used to develop an expert system to predict low clouds at airport terminals is described. The expert system is based on the fundamental physical rules that govern the existence of low clouds. Emphasis is placed on the validation and testing of a qualitative model which is used to determine the low cloud cover. A sensitivity analysis of the system has provided invaluable feedback which will improve the ability to model the physical phenomena involved in forecasting low clouds. The results of this analysis indicated that the turbulence and stability parameters used in the model had little contribution to the diagnostic process. The contribution of vertical motion is significant, but small. The contribution of the dew point depression is overwhelming compared to the other parameters, showing that the bulk of the forecasting effort should be spent arriving at good estimates for the temperature and the dew point temperature. CLOUD CLASSIFICATION FROM SATELLITE IMAGERY USING NEURAL COMPUTING **c47**

B. Archie Bowen and J. David Steenbergen (Atmospheric Environment Service, Downsview, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A study was conducted to determine the feasibility of using neural computing for automatically classifying cloud types as seen in meteorological satellite imagery. A parallel approach to the problem is appealing due to the very large quantities of data involved and the short lifetime of the information. In a feasibility study, neural networks were trained and tested on simulated cloud patterns representing 11 cloud types. The input to the network was preprocessed using pre-attentive filters to create a representation of lower dimensionality. Three types of filters were tested: Fourier-Mellin filters, Gabor filters, and a new type of filter called a prototype image filter. The networks typically consisted of less than 60 neurons with 10 to 24 filters. It was not possible to obtain results for each filter using exactly the same training and test sets. However, classification accuracies for each type of filter were above 90%. Author (CISTI)

METEOROLOGICAL INFORMATION FOR AVIATION: A SYSTEMS APPROACH **c47**

R. G. Humphries, J. N. Geddes, W. C. Cree, and L. W. Diehl *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The use of meteorological information by the aviation community, particularly by air traffic control, is reviewed. Meteorological data are available in three basic forms: alphanumeric, binary, and graphics. Current informational systems do not allow for manipulation or analysis of the data to provide specially derived products and weather alerts, or to select significant information of interest to a particular user. A modernization program is under way at Canada's Atmospheric Environment Service (AES) to improve support for weather office operations and data transfer. The program is providing the potential for accessing new types of information and for accessing information in digital form. In aviation applications, a modernized weather information system would have three principal components: ingestion of data from weather radar, weather satellite, and AES products; data processing to allow extraction and organizing of relevant information from the data stream; and information delivery at fully interactive workstations. An example of such an information system is outlined, based on the MacDonald Dettwiler VORTEX system. Author (CISTI)

CLASSIFICATION OF RADAR CLUTTER IN AN AIR TRAFFIC CONTROL ENVIRONMENT **c04**

Simon Haykin, Wolfgang Stehwien (Litton Systems, Canada Ltd., Etobicoke, Ontario.), Cong Deng, Peter Weber, and Richard Mann *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Highlights are presented from an experimental study aimed at the classification of radar clutter as experienced in an air traffic control environment. The results are based on recorded radar data obtained from two operational radar sites. The Burg algorithm for computing reflection coefficients is the basic mathematical tool used for extraction of radar features based on second-order statistics. Two methods for the classification are described: a parametric Bayes procedure and a neural network approach based on the backpropagation algorithm. The classification accuracies of the two methods were found to be about 82% and 90% respectively. The reasons for the superiority of the latter are discussed. Author (CISTI)

AN EXPERT SYSTEM FOR IDENTIFICATION OF THE TASK STATUS FROM TACTILE SENSOR DATA **c37**

C. S. Vaidyanathan and H. C. Wood *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Tactile data from tactile sensors for robotic applications can be characterized in the form of dynamic force images and processed to obtain decision parameters suitable for task status identification. Decision parameters were obtained by processing raw tactile data from a prototype intelligent manipulator system. The interpretation of these decision parameters was carried out in an experiment using an embedded expert system which was designed using the KES expert system development tool and implemented to interpret the task status of the prototype system. The status displayed by the expert system provides a complete set of information about the task including the direction of any object displacement relative to the gripper. The system performance was validated using test data obtained while grasping a sample object weighing 21 g and was found to be satisfactory. The design of control strategies using the task status information is currently in progress. Author (CISTI)

MLOG: A LANGUAGE FOR PROTOTYPING CONCURRENT SYSTEMS **c61**

Gerald M. Karam and Jeff T. Wilson *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 6 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The design of embedded concurrent systems is a challenging activity because of the complex communications relationships that are usually present. Examples of such applications include telecommunications, process control, avionics, and weapons systems. The MLog language is a multitasking, object oriented Prolog for which the primary application is prototyping embedded concurrent systems. MLog supports the object oriented programming concepts of active and passive objects, classes, meta-classes, inheritance, methods, message passing, and instance variables. Active objects are large-grain communicating sequential processes that communicate with each other using rendezvous and asynchronous message-passing. Passive objects, invoked like procedure calls, have no protection for mutual exclusion. Execution in MLog is based on the top-down resolution mechanism of conventional Prolog, where the object oriented programming systems methods are actually Prolog procedures, and message-passing equates to solving goals. The MLog environment, in particular ProtoTool (a prototyping support facility) and DMLog (a sophisicated debugger) provides the infrastructure for building and studying prototypes of concurrent systems. COMMUNICATIONS SYSTEMS DESIGN FOR TESTABILITY: GREY-BOX TESTING **c32**

Robert L. Probert and Cecilia Geldrez *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Large systems such as telecommunications systems may involve several million lines of executable code and tend to evolve incrementally, thus rendering testing and maintainability a very complex task. For this reason, testing and verification requirements must be defined and incorporated into the development process early in the software development cycle. Thus, design becomes a key component of these systems. An approach to assist in enhancing the testability of software designs is proposed, termed grey-box testing. One particular grey-box testing paradigm named semantic instrumentation is illustrated. Designs are represented as design machines, an extension of finite-state machines. A design-level plan for verification/test is then derived to guarantee branch coverage of the design machine for both normal behaviors and for processing of exceptions. Finally, semantic probes are defined to provide a mapping from the design machine to implemented code. These probes are used to document design decisions, implementation decisions, and execution traces during code verification and test. The process of semantic instrumentation is illustrated on communications services, more precisely, on the service of the alternating bit protocol. Author (CISTI)

PERFORMANCE OF FREQUENCY HOPPED M-ARY FSK IN RAYLEIGH FADING AND PARTIAL-BAND JAMMING **c32**

D. C. Leal *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Military satellite communications systems must have waveforms that ensure reliable performance during jamming and fading situations. An analysis is provided for the performance of M-ary frequency shift keying (FSK) in the presence of system noise, using the Rician fading model. Frequency hopping and worst-case partial-band noise (PBN) jamming are then added to the model and analyzed. Results are displayed showing the worst-case values of the bit error rate (BER) as a function of the signal to jamming ratio (SJR). A straight-line relationship is observed, as was also seen for Rayleigh fading without jamming. The jammer fill fraction and the BER are shown as a function of the fixed to scatter ratio F for a fixed value of the signal to noise ratio and SJR. For high values of F, the Gaussian model may be assumed and a low value of jammer fill fraction is needed to achieve the worst-case result. For low F, the Rayleigh model may be assumed and broad-band jamming is the optimum strategy. For intermediate F values, the Rician model can be assumed. A rapid transition is shown through the few decibels separating the worst-case PBN jamming Gaussian result and the Rayleigh fading result. The ratio F can be considered as a single-parameter bridge beween the worst-case PBN jamming straight line in the Gaussian model and the Rayleigh fading straight line.

GENERALIZED OCTREES FOR CONSTRAINED OBJECT MODELING **c61**
David J. Brewer and Andrew K. C. Wong (Waterloo Univ., Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A computer vision methodology for three dimensional object modeling is discussed. The model consists of a modified form of the classic octree for object representation and selected attributes for object recognition. The generalized octree allows both volume-based and surface-based attributes to be stored and retrieved for object recognition. The object model is constrained to applications in which object orientation measured along primary, secondary, and tertiary axes can be derived during sensor data preprocessing. The model is not based upon or optimized for a specific sensor, but does require a specific form of information to be extracted from the sensor(s) that are selected. The model allows information from multiple sensors to be combined and stored in a single structure, and the model is therefore relevant to sensor/data fusion applications. Results achieved with the model are presented for vehicle recognition applications using an active laser radar and passive infrared airborne sensor system. Simulated dual-mode sensor data was used to generate object prototypes. The object prototypes were then employed to evaluate recognition performance for simulated unlabelled samples. The object model was not tested using live sensor data. The model is well suited for vehicle recognition (e.g., tank versus truck) but is less suited for vehicle identification.

Photoelastic stress analysis is a powerful technique which enables a complete stress analysis to be carried out on engineering components or structures at the design stage. However, the analysis can be a long and tedious process and is normally carried out by an expert. A study was undertaken to create an automated stress and strain analysis system making use of a dynamically controlled stress field to facilitate the acquisition and interpretation of photoelastic data. The first step towards this goal was taken by implementing an interactive isochromatic fringe analysis system (IIFAS) to serve as a basis for further research and development. The algorithms developed for this system are presented together with an analysis of their performance based on actual tests. The IIFAS performs an analysis of isochromatic fringes in several steps. First, the image containing the fringes is cleaned of noise using a median filter. Next, the image is segmented by grey-level thresholding into background and fringes. The thresholding point is determined by an automatic threshold selection algorithm. Finally, the orders of the fringes are assigned by a fringe counting algorithm. The IIFAS performed well during tests using photoelastic images of a disk under diametrical compression. Author (CISTI)

PROGRESS IN THE DEVELOPMENT OF BROADBAND ELECTRIC-FIELD SENSORS FOR TRANSIENT FIELDS **c32**
Art Thansandote, Stan S. Stuchly, Mariusz Barski, and Maria A. Stuchly (Health and Welfare Canada, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Several broadband active E-field sensors in the frequency range from 30 Hertz to 350 megaHertz based on electrically small spherical antennas for measurement of continuous wave and transient fields were developed. Such sensors are suitable for electromagnetic pulse and electrostatic discharge research, lightning measurement, and investigation of biological effects of pulsed electromagnetic fields. Wideband performance of the sensor was achieved by using buffer amplifiers with a very high output impedance. Two monopole configuration sensors and one free-field sensor were built, tested, and calibrated in a transient electromagnetic (TEM) cell in both the frequency domain and the time domain. Each sensor provides a flat frequency independent response up to almost 6 decades. For example, the 5.6 cm diameter hemispherical sensor has the flat response region extending from 30 Hertz to 42 megaHertz with a sensitivity of 1.9 millivolts/(volt/meter). The dynamic range of all sensors was estimated to be over 75 decibels. The rise time of the output pulse for a Gaussian pulse incident field of 450 picosecond width is less than one nanosecond.

TOLERANCE THEORY OF PHASED ARRAY ANTENNAS: A STATISTICAL APPROACH **c32**
A. Sebak, L. Shafai, and G. Bridges *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Random errors, due to perturbations in the excitation coefficients, errors in the placement of antenna elements, mutual coupling, frequency variations in the signal, environmental and manufactring tolerances, etc., have a significant effect on the directivity, beamwidth, pointing angle, and sidelobe levels of the radiation pattern of phased-array antennas. The effect of amplitude and phase errors, and amplifier and phase shifter failures on the antenna performance was studied. The antenna considered is a linear array with amplitude distribution symmetric about the center of the antenna, but is otherwise arbitrary. The phase gradient across the array is assumed to be generated using digital phase shifters of arbitrary number of bits. The mathematical formulations and their numerical implementation are valid for a linear array of arbitrary aperture distribution and number of radiating elements at an arbitrary scan angle. DEVELOPMENT OF AN ANTENNA MEASUREMENT FACILITY OPERATING IN THE 2 GHz - 100 GHz FREQUENCY RANGE **c32**
S. R. Mishra and G. A. Morin (Defence Research Establishment, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A multipurpose research and development facility for antenna pattern measurement in the 2-100 GHz range is being commissioned at the David Florida Laboratory of the Canadian Space Agency. The facility incorporates an anechoic chamber 20 by 14 by 9.5 feet, an antenna positioner with precision encoders, automated control equipment, and a wide frequency coverage network analyzer. The design considerations, equipment details, performance, and salient features of the facility's hardware and software are described. The facility will be used to develop antenna measurement technology for next generation spacecraft, communications, and radar systems, and to provide support for various antenna development projects.

COUPLING GAIN COMPUTATION BETWEEN ANTENNAS ON CIRCULAR CYLINDERS AT SHF/EHF FREQUENCIES **c32**
D. Chatterjee, S. J. Kubina, and R. Paknys *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

In analysis of electromagnetic compatibility of collocated avionics systems, aircraft fuselages are modeled by circular cylinders and antennas by a set of keyhole gains at their individual locations. When the antennas are completely hidden from each other by the fuselage, the unwanted signal reaching the receiver antenna travels round the fuselage in a creeping wave. The creeping wave shading loss between a pair of isotropic sources is simulated using half-wave, magnetic type, axial dipoles on a circular cylinder via the basic scattering code (NECBSC2). The results presented were obtained without modifying the NECBSC2 code and compare fairly well with previously published data. This simulation technique and a probable cause for the discrepancies between the NECBSC2 and AAPG codes are discussed. Author (CISTI)

TRAJECTORY GENERATION FOR DUAL-ARM ROBOTS USING ARTIFICIAL IMPEDANCE APPROACH **c37**
D. S. Necsulescu, R. Jassemi-Zargani, and W. B. Graham (Canadian Space Agency, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Recent research has shown that the trajectory of a robot arm can be generated in real time by assuming artificial mechanical impedances in the robot workvolume. The artificial impedance approach is applied to dual arm robots via an analytical model of the impedance control of a dual-arm planar robot. Simulations are presented to illustrate the manipulation of non-rigid bodies such as a flexible rod and a string, and to illustrate the operation of an impedance controller in the approaching and the coordination phases of the motion of the two arms. The results show that this approach is a candidate for solving some of the difficulties of coordinated dual-arm robot operation, both in the approaching phase and in the object handling phase. In particular, simulation results are obtained for the case of handling a string with sag constraints. Author (CISTI)

A FUNCTIONAL SYSTEM ARCHITECTURE FOR FULLY AUTONOMOUS ROBOT **c37**
S. Kalaycioglu *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The Mobile Servicing System (MSS) Autonomous Robotics Program intends to define and plan the development of technologies required to provide a supervised autonomous operation capability for the Special Purpose Dexterous Manipulator (SPDM) on the MSS. The operational functions for the SPDM to perform the required tasks, both in fully autonomous or supervised modes, are identified. Functional decomposition is performed using a graphics oriented methodology called Structural Analysis Design Technique. This process defines the functional architecture of the system, the types of data required to support its functionality, and the control processes that need to be emplaced. On the basis of the functional decomposition, a technology breakdown structure is also developed. A preliminary estimate of the status and maturity of each relevant technology is made, based on this technology breakdown. The developed functional hierarchy is found to be very effective for a robotic system with any level of autonomy. Moreover, this hierarchy can easily be applied to an existing very low level autonomous system and can provide a smooth transition towards a higher degree of autonomy. The effectiveness of the developed functional hierarchy will also play a very significant role both in the system design as well as in the development of the control hierarchy. Author (CISTI)

ROBOT ARM WITH POSITIONAL ABSOLUTE ENCODED JOINTS **c37**
S. K. Yeung, C. Baribeau (Ottawa Univ., Ontario.), A. Pharand (Ottawa Univ., Ontario.), and E. Petriu (Ottawa Univ., Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

An absolute position measurement method used for control of an experimental three-joint robot arm is based on pseudo random binary sequence properties. A scanning technique is used to solve the code reading ambiguity problems. An 8-bit absolute position encoder was implemented in each robot joint and tested. The absolute encoder is used in conjunction with a conventional incremental encoder mounted on the input motor shaft. This solution provides the advantages of both position measuring techniques, the absolute encoder's noise immunity, and the incremental encoder's very high resolution. The control algorithm and hardware implementation are discussed. Author (CISTI)

JOINT DRIVE DEVELOPMENT FOR THE SPACE STATION REMOTE MANIPULATOR SYSTEM **c37**
W. J. Ballantyne *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Parts of the design of the Space Station Remote Manipulator System's joint drive (the motor and drive electronics) have reached the proof of concept phase, while other parts (the joint drive module, joint housing, and joint electronic unit packaging) exist at present only as mockups of design concepts. The system requirements for the joint drive are outlined and the drive system architectures are described. Drive electromechanics are located within each joint and drive electronics are physically distributed over the length of the manipulator arm. The drives system has a modular design for ready maintainability in orbit. Equipment features are also described along with the considerations that led to their incorporation. These include the brushless motors, friction disc brakes, compound differential planetary gear train, and resolver based position and velocity sensing devices. Author (CISTI)

COMPARISON OF MULTIPLE ACCESS TECHNIQUES FOR BANDWIDTH LIMITED LAND-MOBILE SATELLITE COMMUNICATIONS **c32**
A. Yongacoglu, R. G. Lyons (SkyWave Electronics Ltd., Kanata, Ontario.), and B. A. Mazur (Calian Communications, Kanata, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A capacity analysis and comparison of code division multiple access (CDMA) and frequency division multiple access (FDMA) approaches is presented as applicable to the voice service of a land/mobile satellite system. Both digital and amplitude companded single sideband analog modulations are considered with FDMA. Systems capacities are compared on the basis of identical link availabilities and physical propagation models. Parameters are optimized for a bandwidth limited, multi-beam environment. For CDMA, the benefits of voice activated carriers, antenna discrimination, polarization reuse, return link power control, and multipath suppression are included in the analysis. For FDMA, the advantages of bandwidth efficient modulation or coding combinations, voice activated carriers, polarization reuse, beam placement, and frequency staggering were taken into account. It can be concluded that all systems considered possess various possibilities for capacity enhancement with greater complexity, but the capacity improvements available to the CDMA forward link are probably larger and more easily attainable. COMPARISON OF TWO RANDOM ACCESS TECHNIQUES FOR THE NORTH AMERICAN MSAT SYSTEM **c32**
Stewart Crozier and Brian Skerry (Telesat Mobile, Inc., Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Two random access techniques for the North American mobile satellite system are investigated and compared. The first approach uses only random access inbound signaling channels. The second approach is a type of reservation scheme, and uses a combination of time division multiple access and random access request inbound signaling channels. The performance for both approaches is heavily dependent on the probability of collision in the random access channels. The random access channels are assumed to operate under sloppy slotted ALOHA conditions, to maximize channel capacity. Equating the average number of transmissions per successful inbound information unit for the two approaches, it is shown that the reservation approach is much more bandwidth efficient. AN ADAPTIVE MAXIMUM LIKELIHOOD RECEIVER FOR CORRELATED RAYLEIGH FADING CHANNELS **c32**

Wayne C. Dam and Desmond P. Taylor *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Previous work on receivers suitable for correlated Rayleigh fading channels is examined. The analysis is generalized to complex signaling. It is demonstrated that the error performance of a standard receiver is weakly dependent on the structure of the fading process, and that an appropriate receiver may exploit this structure to give greatly improved performance. Two receiver structures, based on the classic estimator correlator derivation of Kailath, are considered. These structures are able to lower the error floor of a receiver in a correlated, Rayleigh fading channel. The performance limitation is found to be due to the form of the receiver used, rather than a fundamental channel capacity type of limit, and the appropriate receiver structure is able to virtually eliminate the asymptotic error. The performance of both standard and optimal receivers is examined analytically and verified through simulation. Author (CISTI)

TELEGLOBE'S INTERNATIONAL MOBILE EARTH TERMINAL SERVICE **c32**

Joel Duchoeny *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

In 1990, Teleglobe Canada initiated a developmental Mobile Earth Terminal (MET) service. By the use of the INMARSAT satellite, the service can provide voice and data communication capabilities between lightweight, self-contained terminals and the international public telephone network. Initially, the developmental program provides service to a test group of up to 18 terminals. Plans are under way to introduce a global digital service to the public by 1991-92. Such a service will have the potential to solve communication problems for such users as news media, diplomatic corps, disaster relief teams, construction teams in remote areas, and expeditions. The terminals are briefcase size and include L-band transmitter, receiver, and antenna, a power supply, and batteries. Equipment setup can be easily done in 1-2 minutes. Calls are made by aiming the antenna at the MARECS B2 satellite (covering the Atlantic Ocean region) and dialing the appropriate number. Author (CISTI)

ARRAY-FED REFLECTOR SYSTEMS WITH LIMITED SCAN **c32**

K. K. Chan and R. Martin (Defence Research Establishment, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Results of an investigation of single parabolic reflector systems with small focal length/diameter ratio and limited electronic scan capability are presented. Such systems have been proposed for space-based radar surveillance application in the form of a rotating reflector antenna sweeping the earth's surface. Center-fed and offset-fed reflectors with focused, defocused, and transform feed arrays are the configurations studied. The performance goal is to achieve a minimum of three or four beamwidths of electronic scan in both elevation and azimuth with sidelobes of less than -40 dB in the receive mode. On transmit, maximum directivity is sought. High power distribution and switching among feed elements is to be avoided. The offset reflector fed by a defocused array with a corporate beamforming network or a transform feed is found to meet these requirements. Author (CISTI)

A DUAL POLARIZED BROADBAND MULTIFREQUENCY EARTH STATION FEED **c32**

K. K. Chan, S. R. Gauthier (Department of National Defence, Ottawa, Ontario.), and G. Dinham (Department of National Defence, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Communications satellites are increasingly designed to operate in more than two frequency bands. To communicate with these satellites, it is more cost-effective to use a single multiband feed with a suitably designed Cassegrain reflector system than having several separate ground stations. Procedures for designing such a feed, which can operate simultaneously in three bands are presented. The feed has well-matched orthogonally polarized ports, with dual circular polarization in the C and X bands and dual circular or dual linear polarization in the Ku band. Measured results are given from the integrated feed system alone and when installed on a reflector antenna. These results fully validate the design concept adopted. Author (CISTI)

RCS OF FUNDAMENTAL SCATTERERS IN THE HF BAND BY WIRE-GRID MODELLING **c32**

C. W. Trueman and S. J. Kubina *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

To extract the maximum information from the return of a radar target such as an aircraft, the target's scattering properties must be well known. Wire grid modeling allows a detailed representation of the surface of a complex scatterer such as an aircraft, in the frequency range where the aircraft size is comparable to a wavelength. A moment method analysis determines the currents on the wires of the grid including the interactions between all parts of the structure. Wire grid models of fundamental scatterers (plates, strips, cubes, and spheres) of sizes comparable to the wavelength in the 2-30 MHz range are analyzed. The study of the radar cross section (RCS) of wire grids in comparison with measured RCS data helps to establish guidelines for building wire grid models, specifying such parameters as where to locate wires, how short the segments must be, and what radius to use. The guidelines so developed can then be applied to build wire grid models of much more complex bodies such as aircraft with much greater confidence. Author (CISTI)

WIDE FREQUENCY POLARIMETRIC RADAR CROSS SECTION MEASUREMENTS **c32**

S. R. Mishra, P. Charron, J. Smithson, and J. Mantz *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Modern radar cross section (RCS) measurements require determination of the full polarimetric scattering matrix on complex targets. Some of the special considerations necessary for these measurements include appropriate choice of calibration targets, proper equipment setting for full target response, and effect of target support system. A polarimetric RCS measurement facility having a target support column and positioner, transmit and receive antennas, a network analyzer, and automated data measurement and analysis capability is described. The target and antennas are mounted within an anechoic chamber. The facility is presently configured for X band

monostatic measurements and results are presented in the form of maps of amplitude and phase contours for a 7 cm metallic cube.

THE AIR TRAFFIC CONTROLLER'S MENTAL MODEL AND IT'S IMPLICATIONS FOR EQUIPMENT DESIGN AND TRAINEE SELECTION **c53**
Richard H. Mogford *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

In the context of air traffic control, a controller's mental model is a hypothetical construct which refers to the operator's learning and concepts about a system and what it is supposed to do. It is suggested that the controller's picture of the various elements of the air traffic control system is an aspect of the mental model which is worthwhile investigating in order to assist in system design and the selection of controllers. Previous research on air traffic control mental models is reviewed and applied to air traffic control systems. It is seen that objective tools exist for exploring some facets of the operator's mental model of a complex system. There are promising indications that these tools can help measure some aspects of the controller's mental model or picture. There is also evidence that the quality of a controller's picture is related to operational skill level.

THE CANADIAN AUTOMATED AIR TRAFFIC SYSTEM **c04**
Don E. Ludwig *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The Canadian Automated Air Traffic System (CAATS) provides a model for future air traffic systems operating in the year 2000 and beyond. The design has configuration flexibility and extensibility provisions which will enable the system currently being implemented to adapt to the requirements of the 2000s. Key elements of this design are described. These are: an architecture which uses an open system interconnect for inter- and intra-system interfacing of distributed data processing and display elements; use of commercial off-the-shelf components and software with provision for substitution of evolving technology; use of Ada software and a partitioning which will facilitate maintenance and adaptation to future operational needs; introduction of a computer human interface design and state of the art workstations which facilitate efficient controller interaction and have flexibility for adaptation to a changing environment; and incorporation of automated on-line maintenance reporting and system configuration control from a centralized position. COMPUTER-CONTROLLED ALIGNMENT FOR A 2000-LINE COLOR MONITOR **c04**
David A. Eccles, Manabu Suzuki (Sony Corp., Tokyo, Japan.), Hiroshi Nakano (Sony Corp., Tokyo, Japan.), Yuki Okamoto (Sony Corp., Tokyo, Japan.), and Kazuo Kii (Sony Corp., Tokyo, Japan.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Field alignment of a new 2048 line, 20-by-20 inch color monitor used for air traffic control is made easier by means of a new remote digital alignment system. The system includes a video processor, a digital processor for alignment data, and deflection and correction circuits. A personal computer running the alignment software is used to perform adjustments on the production line. A remote controller similar to that used with a television is provided to support field maintenance. The alignment system allows menu-driven convergence, color purity, focus, and distortion adjustment via a digital interface. Automatic setup functions for white balance and color purity have also been developed. Touchup alignment by unskilled customers can be done in about 15 minutes. Author (CISTI)

EVOLUTION OF RADAR DATA PROCESSING IN THE FRENCH AIR TRAFFIC CONTROL SYSTEM **c04**
D. Figarol and B. Kriner *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A research study called HADAMARD is described which is aimed at providing a new multiradar multiplot tracking system for air traffic control in France. The system is based on state of the art and advanced tracking technology to take full advantage of monopulse radar coverage that will be implemented at the present time. This system will help to reduce minimal radar separations between aircraft without a loss in safety. After an overview of the more general context of radar data processing evolution in France, functional characteristics of HADAMARD are described in the areas of system design, input management, track initiation, data association, track update and maneuver detection, and estimation of radar bias. The HADAMARD prototype has been developed in Ada software, and its evaluation phase was completed in the summer of 1990. HADAMARD is on its way to integration into the CAUTRA 4.1 software which will be rehosted on new Data General MV computers. Author (CISTI)

SUPERVISED AUTONOMY IN TELEROBOTICS **c63**
N. Burtnyk and J. Basran (Ottawa Univ., Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 7 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Advanced autonomous robots are envisaged for applications in harsh, demanding or dangerous environments such as nuclear, underwater operations, space, mining and tunneling, civil engineering and construction, etc. A major challenge in telerobotics development is to incorporate the robot's capability for autonomous operation wherever possible. A supervisory control concept for exploiting autonomous functionality in an unstructured environment is presented. Through an effective man-machine dialogue, the operator uses human perceptual and planning abilities to assist the robot in acquiring a model of its environment. Once this structure is acquired, the operator instructs the robot on how to perform a task as a sequence of actions based on generic skills. A discussion of the technical solutions that are essential to implement this concept and the results of a study to develop a robot operating under supervised autonomy are presented.

A MULTIPROCESSOR ARCHITECTURE FOR REALTIME ROBOT CONTROL **c60**
Shadia Elgazzar *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The control of autonomous robots and their operation in unstructured environments offer a challenging problem to the researchers in the field of robotics. Hardware and software architectures must be reconsidered, as the real-time requirements cannot be met using conventional machines. A configurable and adaptable architecture for real-time robot control has been developed based on a multi-processor based architecture and Harmony, an object-based, real-time, multiprocessing, multitasking operating system. This architecture is capable of supporting, in a consistent manner, every aspect of an intelligent robot system. The modular construction of the hardware and software components of this controller has minimized robot dependencies, which makes it capable of controlling many types of robots. The necessary requirements for a versatile robot system controller and the implementation of an open architecture for controlling single/dual robot manipulators are described. The porting of Kali, a powerful low-level programming system for multiple robot control, to Harmony is also described. Author (CISTI)

RADAR BEAM EFFECTS FOR A FLIGHT SIMULATOR USING SIGNAL PROCESSOR BASED HARDWARE **c32**
E. J. Nemer, R. C. Bridegeman, and A. S. Malowany (McGill Univ., Montreal, Quebec.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The design of a signal processor based system to simulate the beam-forming effects of airborne radars is presented. The problem is first formulated as a digital filtering operation with the filter response derived from the power distribution function of the radiating antenna. To lighten the computational load required for real-time simulation, an efficient finite impulse response (FIR) filter implementation proposed by Chu and Burrus (1984) is used. The algorithm, a unique implementation of FIR filters, is based on a polynomial approximation of the filter's response and results in significant reduction in the number of operations. In spite of this optimization, very high arithmetic throughput is still needed for real-time simulation. To design a system with the required capability, a high performance signal processor, the TMS320C30, was selected. The system also includes a data channel controller, an arbitration logic, fast memory elements, and a parallel interface to the host computer. The architecture is made modular, allowing many similar units to be teamed up and provide virtually unlimited computing power. The system is programmable and can simulate a variety of radar systems of different characteristics. Author (CISTI)

AIRBORNE DATA ACQUISITION USING A FRONT-END PROCESSOR ARCHITECTURE **c60**
J. E. Jordan and K. K. Lum *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

An airborne data gathering and processing system is described, employing front-end data acquisition processors in a multiprocessor architecture. The system is used to make measurements of the earth's magnetic field using three sensors mounted in the wing tips and tail of an aircraft. In addition, data are acquired from a series of navigation and avionics systems so that measurements recorded by the system can be referenced spatially. The system uses a central host processor as well as a coprocessor to process data acquired from the front-end data acquisition processors. Real-time processing includes magnetic compensation of the aircraft, optimal estimation of the position of the aircraft, and informational displays for the pilots, navigator, and equipment operator. EMBEDDED GPS: THE CANADIAN MARCONI APPROACH **c04**
James M. Brown and R. K. Tiedemann *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A new, embeddable global positioning system (GPS) card set uses the same software algorithms and very similar hardware architecture as the Canadian Marconi CMA-786 GPS navigation receiver. Three circuit cards totalling 50 square inches and typically consuming only 7.5 watts implement a complete 2-channel GPS sensor suitable for embedding in other avionics navigation equipment, land vehicle navigation equipment, or time transfer devices. A high speed 8-bit parallel interface and an RS-232 interface are provided to facilitate this integration. A separate power supply, mechanical housing and integrated microstrip antenna / preamplifier are required. Satellite acquisition and tracking algorithms, Kalman filter and navigation software, and hardware implementation are described. Author (CISTI)

CONSTANT AVERAGE POWER SINGLE SIDEBAND (CAPSSB) MODULATION **c32**
E. E. Matt and J. H. Lodge *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

In a mobile satellite environment, amplitude companded single sideband (ACSSB) schemes for speech transmission can offer a degree of robustness to fading and shadowing that is difficult for alternate approaches to match. One drawback to ACSSB signals is that neither their average nor instantaneous transmit powers are constant. A new single sideband scheme is described which exhibits a nearly constant average transmit power and limits the peak instantaneous transmit power to only a few dB above the average level. In this scheme, a single digital signal processing microprocessor performs all the modulator functions. The architectures of the modulator and demodulator sections are described, and the technique for peak-to-average ratio reduction is discussed. The soft voice activation algorithm is also presented. The system has successfully transmitted speech over the MARECS-B satellite using constant average power single sideband radio in the vehicle and matching equipment in the hub station. These tests showed that the system can transmit voice over a 5 kHz channel with good communications quality when the received carrier to noise power spectral density ratio is 50 dB-Hz or greater. SIGNAL PROCESSOR BASED MSAT TRELLIS CODED M-DPSK WITH ADAPTIVE DOPPLER PHASOR CORRECTION **c32**
P. Bengough, L. Berg, B. Koblents, and P. J. McLane *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A trellis coded M-differential phase shift keying (DPSK) modem with convolutional interleaving and deinterleaving has been developed and tested on a system consisting of three signal processing chips. The coded modem is either 2400 or 4800 bps in a 5 kHz bandwidth, whereas 1200 to 7200 bps can be supported without coding. All digital transmitters and receivers are designed using a 4 kHz carrier. Integrate and dump driven Viterbi decoding is used. Timing recovery is based on early/late gate principles which are extended to 8-DPSK modulation. This involves a novel threshold scheme. Open-loop Doppler correction is used in the setup mode and the tracking technique of Ungerboeck, Edbauer, and Natali (1982, 1989, 1986) for the data mode. The Doppler phasor is corrected rather than the Doppler frequency as it is easier to implement in digital signal processing realizations. The modem has been tested in the laboratory for a noise channel and no Doppler frequency correction. Author (CISTI)

TWO-STAGE DOPPLER PHASOR CORRECTED TCM/DMPSK FOR SHADOWED MOBILE SATELLITE CHANNELS **c32**
P. J. McLane *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A two-stage Doppler correction algorithm is presented for mobile satellite, digital signal processing based modems. The modulation considered is trellis coded differential phase shift keying (DPSK) involving eight signal points. The Doppler phasor rather than the Doppler angle is corrected as it leads to easy realization in digital signal processing software. The Doppler phasor correction algorithm presented has a set-up mode where the data are known and a data mode where the data are unknown. Both digital simulation and analytical techniques are used in the performance analysis. Author (CISTI)

STATUS OF THE CANADIAN MILITARY MULTIBEAM ANTENNA (MBA) DEVELOPMENT FOR EHF SATCOM **c32**
G. A. Morin, E. B. Felstead (Communications Research Centre, Ottawa, Ontario.), K. S. Rao (Spar Aerospace Ltd., Sainte-Anne-de-Bellevue, Quebec.), and K. K. Chan (Chan Technologies, Inc., Kirkland, Quebec.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

In support of ongoing research on extremely high frequency military satellite communications, exploratory development work is being conducted on multibeam antennas for use on board satellites having Canada-wide coverage. The emphasis is on receive antennas that possess narrow beams, fast beam hopping, and low sidelobes for rejection of interference outside the beam area. To attain the stringent specifications required, a number of approaches were considered. A method of combining seven adjacent beams into one composite beam was found to be the best way to meet the specifications. This method uses a single aperture (lens or reflector) and standard focusing but combines a septet of adjacent beams (or horns). Among the focusing configurations studied, it was found that the single offset reflector gave the best results. Author (CISTI)

COMPARISON AND DESIGN OF MULTIPLE BEAM ANTENNA FEED NETWORKS **c32**
K. K. Chan, D. Faubert (Defence Research Establishment, Ottawa, Ontario.), and R. Martin (Defence Research Establishment, Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The architectures of three types of multiple beam networks are discussed along with their performance and capability. The networks considered are the Blass matrix, the Butler matrix, and the Rotman lens. To illustrate their properties, representative networks are characterized by their scattering parameters. Realistic models, verified by measured results, are used in the performance analysis. The relative merits of these networks are evaluated. Areas of applicability best suited to each type of network are indicated. The Blass matrix is preferred when the number of beams required is about two to four. The Butler matrix can produce a larger number of high quality beams with fewer components than the Blass matrix. Because the lens is a true time delay device, the scanned beam pointing remains invariant with frequency; this is desirable for electronic countermeasures systems. Author (CISTI)

RECENT ADVANCES IN BOOTLACE LENS DESIGN **c32**
K. K. Chan, W. B. Wallace (AeroSmith Systems Corp., Los Altos, CA.), and R. R. Blasing (AeroSmith Systems Corp., Los Altos, CA.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A bootlace lens is a beamformer which produces simultaneous multiple beams that span a given coverage area. It comprises a cavity region fed by input ports, output ports and dummy loaded ports. Bootlace lenses are used in applications which demand frequency invariant beams such as feed networks in electronic countermeasures or surveillance systems; they are also well suited as transform feeds for reflector and space-fed lens antennas. Until recently, design of these lenses has been based on experimentation, adjustments, and proprietary knowledge. An analytical alternative to the experimental approach is presented. The lens is analyzed, when implemented in stripline or microstrip, as a planar multiport network with an arbitrary contour. Entire domain basis functions are used for the port apertures to achieve fast convergence to the final solution. Experimental results from a microstrip lens and a stripline lens are presented to verify this method of analysis. With the ability to predict lens behavior accurately, a design approach is established that will yield lenses possessing prescribed properties such as matched ports and low ripple level in the transmission responses at the array ports. ENGINEERING MANAGEMENT CONSIDERATION FOR AN INTEGRATED AERONAUTICAL MOBILE SATELLITE SERVICE **c32**
John M. Belcher *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

In order to meet local air traffic control terminal requirements as well as national and transborder requirements, countries have developed communications, navigation, and surveillance (CNS) systems having little systems integration and a solely ground-based solution to air traffic control problems. It is believed that the application of satellite technology is the only currently viable solution that will enable international civil aviation to overcome the shortcomings of the presently available CNS systems. If properly implemented, available satellite system technology integrated with avionics and ground based capabilities, can be used to meet new global aviation demands. A clear transition plan has to be implemented so as to ensure continuity of service, recognize user-borne costs, and satisfy institutional and national objectives in the progress toward a universal air traffic management (ATM) system. ATM systems design should rely on a modular approach for flexibility and upgrading. An aeronautical mobile satellite service is intended to provide a worldwide satellite data link and direct air/ground voice communication. Institutional and financial roadblocks for implemetation of a global based approach will likely be far greater than technical constraints. Author (CISTI)

ADAPTING SYSTEM ENGINEERING PRINCIPLES TO THE CANADIAN AIRSPACE SYSTEM **c04**
T. E. Thompson and R. G. Lewis (Martin Marietta Canada Ltd., Ottawa, Ontario.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Adaptations have been made to published textbook methodologies for system engineering to allow practical application to the Canadian Airspace System (CAS) redesign. The CAS is the collection of equipment and facilities which, together with skilled personel, processes, and procedures, makes up the Canadian air navigation and traffic control system. The CAS design process must put into place a complete design for the year 2000 CAS as well as a process for making controlled design changes in the future. The application of systems engineering principles in this design process is absolutely necessary to avoid expensive duplication or incompatibilities. The following six steps that are being used in the CAS redesign are described: preparing operational requirements for the systems; developing the operational and support concepts for the system; specifying system requirements; specifying system design at four different levels; developing a transition plan; and developing an integration strategy to control and manage system implementation. Support tools used in the redesign are briefly discussed, including computer aided design tools and an engineering data base. Author (CISTI)

AN AUTO-GUIDING SYSTEM FOR MID-SIZED TELESCOPES **c89**
J. W. Haslett, W. Gonnason, S. Balasubramanian, R. J. Condon, F. N. Trofimenkoff, and S. E. Nordquist *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 6 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Some aspects of mid-sized telescope auto-guiding are introduced along with the special guidance problems associated with the Univerisity of Calgary's infrared telescope, a 1.5 meter aperture instrument with an alt-alt mount and two-channel photometry system. Two new types of position detecting sensors are discussed as candidates for inclusion in auto-guiding schemes that solve the telescope's tracking problems. One is a monolithic complementary metal oxide semiconductor implementation and the other is a short integration time sensor. Both of these devices calculate the centroid of a diffuse optical source that is focused on them. A description of the centroiding system is provided and the main sensitivities associated with the guiding method are identified. Performance guidelines are given for these sensors along with some results of low flux level testing of these devices. It is found that both sensors are suitable, with some prior intensification, for use in an auto-guider for the infrared telescope and any other mid-sized telescope tracking system. Author (CISTI)

FIBER-OPTIC POLARIMETRIC STRAIN GAUGE **c35**
Wojtek J. Bock and Tomasz R. Wolinski (Warsaw Univ., Poland.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A prototype fiber-optic polarimetric strain gauge based on the polarization mode coupling that occurs in highly birefringent optical fibers under the influence of axial strain is presented. Measurement set-up for a bonded strain gauge and its metrological characteristics are discussed together with the interpretation of observed physical effects in terms of changes in beat-length parameter under axial strain. The device is far more sensitive than conventional strain gauges, and can also be readily adjusted to a specified range of strain through an appropriate choice of fiber length and optical signal wavelength. The temperature drift of the device can be compensated in a straightforward procedure. The device is immune to electromagnetic interference, and is intrinsically safe in electrically dangerous, hazardous or explosive environments. Another attraction of this technology is its direct compatibility with fiber-optic telemetry, optical data transmission systems and multiplexing / demultiplexing technology. Author (CISTI)

DESIGN ISSUES AND INITIAL PERFORMANCE OF AN ADAPTIVE AIR/GROUND/AIR HF COMMUNICATION SYSTEM **c32**
G. R. Nourry and D. G. McLachlan *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 7 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Airplanes flying in the Canadian Arctic are often without communication to an appropriate air traffic control center for substantial periods of time. Attempts to provide continuous communication coverage for such aircraft must take the special geography of the region into account. High frequency communications appears to be the only practical single medium that can potentially provide this service. The constraints and the issues involved in the design of an air-ground-air high frequency communication system for arctic operation are discussed. The system design incorporates both the Link-11 standard and an automatic link establishment (ALE) unit. It is demonstrated that Link-11 and ALE techniques are, in some cases, complementary and that for the specific case of high frequency skywave propagation, ALE techniques are necessary for efficient operation of a Link-11 system. The system has been implemented in an experimental configuration at four stations in the Canadian Arctic, which will be operated for a year at a period of sunspot maximum in order to evaluate system performance and to study high frequency transmission in polar regions. ADVANCED HF DIGITAL NETWORKS **c32**
Marvin Baker and N. P. Robinson (Rome Air Development Center, Griffiss AFB, NY.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Technology developments in high frequency digital communications, being applied to mobile users spread over a large continental size area, are reviewed. The objective of these developments is to integrate efficient multiple access methods, prudent frequency management, and improved link quality analysis (LQA) into a user friendly communications network for military and civilian users of land vehicles, ships, and aircraft. The network scenario envisaged comprises a variable number (up to 100) of users distributed randomly over a circular area of 6400 km radius, with 3-10 members active at any given time. Members shall be frequency hopping while sharing a common hop set in a subset of the high frequency band using skywave, near vertical incidence skywave, multi-hop, and groundwave propagation. Network specifications include digital voice or data at 75 to 2400 bps in a 3 kHz bandwidth, Doppler shift of up to 50 Hz, multipath delay of up to 5 milliseconds, and long (1/4 Hz) and short (2 Hz) duration receive signal fades. A three stage approach is used for development of this network. Results to date are presented in the areas of bit error rate measurements, channel evaluation, access methods evaluation, and network simulator development. Author (CISTI)

SEMI-BLIND RESTORATION OF IMAGES DISTORTED BY RANDOM TIME VARYING POINT SPREAD FUNCTIONS **c65**
Edward Lam and Rabab K. Ward (British Columbia Univ., Vancouver.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The problem of restoring images from multiple observations in the presence of noise is considered. The distortion is due to a random, time varying inhomogeneous medium such as atmospheric turbulence. The point spread function at the time of observing each image is also recorded. The observation of the point spread function is also contaminated by noise. Since the correlation from one frame to the other is unknown, conventional restoration methods have mainly been based on averaging. A maximum likelihood solution is developed for this problem and it is shown that its results are better than those based on averaging. It has also been found that compared to the linear regression method, the maximum likelihood method is less stable when the number of observations is not large, or when the distortion is not small. MORPHOLOGICAL AND ORDER STATISTIC FILTERS: A COMPARATIVE STUDY **c33**
Renee L. J. Martens, Ziheng Zhou, and Anastasios N. Venetsanopoulos *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The performance of five order statistic filter and four morphological filters is compared based on criteria which were chosen to be close to the characteristics of the human visual system. Four different noise distributions were used in the experiments conducted for the comparison: Gaussian noise, impulsive noise, the mixture of those two, and double exponential noise. The fact that the performance of a filter is image-dependent, even with identical noise distribution, was also considered. Three different types of test images were used in the evaluations: a synthetic image created for examining edge- and line-preserving properties of a filter; a real image containing many edges and small details to test detail preserving capability; and a background of clouds, which is a simulation of real infrared radar images. The results suggest that some order statistic filters are better suited for edge preservation and noise removal than the morphological filters. It is noted that for cloud removal, the open-closing, adaptive window edge detecting, median, signal adaptive median, and moving average filters all detected the targets with very low false alarm rates, although they were not originally designed for such a task. IMAGE ENHANCEMENT USING AN ANALOG DEVICE NEURAL NETWORK **c33**
Nora M. Znotinas and Franklin M. McGovern *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A fully parallel analog device neural network which simulates the outer plexiform layer of the retina is presented. The prototype network is a 36 cell linear array with the option of first and/or second neighbor interaction. Results focus on lateral inhibition due to: (1) the first nearest neighbors where a cell's output is mediated by the value of the neighboring cells to the immediate left and right; and (2) the second nearest neighbors where a cell's output is mediated by the value of two neighboring cells to the left and also to the right. Results focus only on the static and spatial aspects of images. It is apparent from the results that it is contrast, not absolute changes in background illumination, that primarily determine the response amplitude. The network shows pulse responses that are consistent with the response of the outer plexiform layer of the retina. The impulse response of the network demonstrates contrast invariance under variable illumination, dynamic range compression, and pulse and edge enhancement. Author (CISTI)

SIMILARITIES BETWEEN SYNTHETIC APERATURE RADAR AND GROUND PROBING RADAR IMAGING **c32**
Bernard Armour, Alan Judge (Geological Survey of Canada, Ottawa, Ontario.), and Ron Saper *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

Two radar imaging techniques of synthetic aperture radar (SAR) and pulsed ground probing radar (GPR) are reviewed, drawing attention to the fundamental similarities in the image formation processing. An airborne SAR image of the ground terrain is formed by flying along a track and collecting radar echo measurements with the side-looking antenna sweeping out a strip along the ground surface. A pulsed GPR image profiling a cross-section of the subsurface is formed by repeated radar measurements at discrete intervals along a straight line on the ground surface. In both cases, the image is formed by combining the set of discrete measurements along the track to achieve a high resolution image in two dimensions. The processing consists of two steps: pulse compression and azimuth compression. Range processing and azimuth processing are described with reference to the filtering used and the reflectivity functions involved. Examples of SAR and GPR images are included. Author (CISTI)

SEGMENTATION OF SAR IMAGES **c32**
N. Kaliaguine and J.-N. Beaulieu *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A new and simple filter is presented which is useful for the segmentation of a synthetic aperture radar picture. The filter used corresponds to an adiabatic transformation, is reversible, and does not introduce information loss. The purpose of the filter is to transform the noise model of the image from multiplicative Gaussian to additive Gaussian, the latter being easier to process. Two assumptions are used in processing an image: that the image had a multiplicative noise (always a good approximation for a synthetic aperature radar image) and that the regions in the image can be discriminated by the average of their pixels. A hierarchical stepwise optimization algorithm is used in conjunction with the filter to segment images. Experimental results are presented to illustrate the segmentation of an aerial agricultural image under various filtering methods. Author (CISTI)

THE EVOLUTION OF GLOBAL MOBILE COMMUNICATIONS **c32**
A. I. Spolsky and J. R. Brasic *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 6 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A long term, global viewpoint is presented on the subject of communications access which may be the key to resolving many of the world's current requirements for developing a truly global, ubiquitous mobile/personal voice and data communications capability. The solutions are multi disciplinary, some using terrestrial techniques, some by satellite, but both using a variety of technologies and techniques. In the area of satellite communications, the focus is on inexpensive, efficient antennas, high gain spacecraft amplifiers and efficient power and bandwidth modulation techniques including high performance, low bit rate voice codecs. Terrestrially, many of the same technologies apply to cellular telephone systems. A key issue is the electromagnetic spectrum and its utilization efficiency, especially if the popularity of cellular telephones is repeated in the development of mobile satellite systems. Integration of diverse systems depends on formulating a framework that will allow systems to be interoperable by specifying logical interfaces among most or all evolving niche systems. ISSUES OF ATC CONFLICT RESOLUTION UNDER REAL-TIME CONSTRAINTS **c04**
I. G. Smith and C. A. Crabb *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The CORES 2 (COnflict REsolution System) project has the goal to produce a developmental system that provides conflict detection, prediction, and resolution advice to air traffic controllers in an enroute radar controlled airspace. Unlike several other developmental efforts, the project attempts to address many of the real-time and other temporal issues involved in this area. Some of the issues which are currently under investigation as part of the implementation of the system are described. These issues include prediction mechanisms, priorities for resolving concurrent conflicts, time allowed for presentation of solutions, validity intervals of solutions, interactions between conflicts and solutions, and presentation of conflicts and solutions. An object oriented rule-based system was chosen as a suitable development environment for the CORES system, which also includes an air traffic simulator. Author (CISTI)

NATIONAL AIRSPACE SYSTEM PERFORMANCE ANALYSIS CAPABILITY (NASPAC) SIMULATION MODEL **c04**
Lynne Fellman *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The National Airspace System Performance Analysis Capability (NASPAC) simulation model was developed to assist in analyzing the performance of the US National Airspace System and to estimate the effects of proposed changes in the system. An early version of the model was used to identify entities such as airports and airspace that limit system performance and to evaluate the impacts of changes to some of these entities. Subsequently, the NASPAC simulation model was enhanced and has been used to analyze the impact of planned and proposed improvements to major airports, potential changes to airspace structures, anticipated future growth in air traffic demand, and changes in airline scheduling practices. Principal inputs to the model include air traffic demand, airport and airspace network structures and capacities, and flight or aircraft characteristics. Principal outputs include operations per hour, instantaneous aircraft counts, and aircraft delays. Three recent applications of the NASPAC model are described: analysis of national impacts of the Dallas-Fort Worth Metroplex plan; analysis of impacts of a new air carrier hub at Philadelphia; and a national airspace saturation analysis. PROCEDURAL DEVELOPMENT PROTOTYPE IN AUTOMATED EN ROUTE AIR TRAFFIC CONTROL **c04**

C. Vanessa Fong *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 3 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A key element in the US Federal Aviation Administration's plan to modernize the air traffic control system is the Advanced Automation System which incorporates the collection of automation capabilities known as Automated En Route Air Traffic Control (AERA). AERA has three components: AERA 1, with the capabilities of aircraft trajectory estimation, automated problem detection, and trial planning; AERA 2, summarized below; and AERA 3, currently in the concept development phase. In order to support the evaluation of AERA 2 capabilities, a procedural development prototype is being developed for use in defining, evaluating, and revising air traffic control operational and training materials for AERA 2. The prototype is implemented on a VAX 8700/VMS system in PL/1. The AERA 2 traffic simulation and other capabilities are displayed on color monitors with graphics controllers. Capabilities of the prototype include automated problem resolution, computer human interfacing, automated controller aids, air traffic control scenario generation, data collection, and other graphics image capture and replay tools. The overall characteristics of this prototype are discussed. Author (CISTI)

ENHANCING AVAILABILITY, PERFORMANCE, AND FLEXIBILITY OF AIR TRAFFIC CONTROL AIR-GROUND SERVICES **c04**

Gian P. Jain, Douglas L. Bamford, and Leone C. Monticone *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 5 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The air-ground (A/G) communications service for the air traffic control (ATC) community must be designed to provide end-to-end communications that meets high availability and performance requirements. These service requirements, such as voice quality, can be satisfied by the proper selection of network elements and design of the A/G network. The terrestrial portion of the A/G voice service is discussed along with the radio frequency link portion of this service. The evolution of the A/G network operations from a manual to an automated process for restoration and management is demonstrated, such evolution leading to new configurations with the potential for better availability, performance, and flexibility in an ATC environment. In addition, preliminary work is presented on a procedure that can be used to take into account the dependencies that may occur between failures (such as dependencies between circuit failures in the terrestrial environment) in any availability analysis. CHANGING ROLE OF TELECOMMUNICATIONS MANAGEMENT IN AIR TRAFFIC CONTROL IN THE FAA **c04**

Kikram Prabhu *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

The mission of the US Federal Aviation Administration (FAA) is air traffic control (ATC). As the ATC function has evolved over the years from being primarily manual to one supported by many interconnected automated systems, the associated telecommunications requirements have become more specialized. Consequently, the FAA telecommunications network has changed over time and consists of a number of subnetworks and subsystems, some of which are interconnected in a complex manner. More subsystems are planned and will be added over the next few years. Since there is a combination of FAA-owned and leased subsystems, management of the overall network and its evolution is becoming very important. The rapidly changing telecommunications market environment in the USA has increased available equipment and service offerings; it has also made it necessary to deal with multiple carriers and vendors. The telecommunications management infrastructure for Operations, Administration, and Maintenance (OA&M) in the FAA is described along with the undergoing changes in its role. As the overall network is becoming very complex, the telecommunications management structure has to emphasize the end-to-end service perspective rather than that of individual subsystems to ensure responsiveness to ATC users. ADAPTIVE FILTERING FOR CLUTTER SUPPRESSION IN HIGH FREQUENCY RADAR **c32**

Rafaat H. Khan *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

High frequency (HF) radar has the unique potential for over the horizon detection of ocean surface targets. However, ocean waves are also strong reflectors for HF radar and this high clutter level has limited its application for target detection. New results from the time domain analysis of ocean clutter show that it can be modelled as two angle modulated signals. This may be used to selectively suppress the clutter component and enhance the target detection performance. The practical implementation of clutter suppression, based upon this model, involves tracking of multiple time-varying sinusoids. An adaptive filtering technique to track time-varying sinusoids is discussed and initial results are presented. Author (CISTI)

DEVELOPING AUTOMATION FOR TERMINAL AIR TRAFFIC CONTROL: CASE STUDY OF THE IMAGING AID **c04**

Anand D. Mundra and Kerry M. Levin *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)

Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A passive automation aid called the imaging aid or ghosting aid has recently been developed for the US Federal Aviation Administration to help air traffic controllers stagger aircraft to converging runways in instrument flight rule conditions. This aid has been prototyped in a real-time simulation facility with the help of full performance level controllers, has been approved for operational evaluation at Lambert St. Louis International Airport during 1990, and is expected to be deployed nationally in the USA starting in 1992. The prototyping process used in the development of the imaging aid is described as a case study in developing air traffic control (ATC) automation. In this process, the imaging aid was designed to solve the difficulty of precise staggering on a sustained basis by converting the converging approaches geometry to simulate a single runway approach geometry. A methodology is proposed for the development of automation for terminal ATC based on the lessons learned from this prototype. Author (CISTI)

AIRSPACE DESIGN EXPERT SYSTEM (ADES), A 2D/3D MAPPING AND MODELLING TOOL INCORPORATING AN EXPERT SYSTEM FOR USE IN INSTRUMENT APPROACH DESIGN **c04**

J. C. Ainsworth, L. Lam (Virtual Prototypes, Inc., Montreal, Quebec.), B. Schoor (Virtual Prototypes, Inc., Montreal, Quebec.), and M. McQueen (Virtual Prototypes, Inc., Montreal, Quebec.) *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1

and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

ADES (Airspace Design Expert System) provides Transport Canada with a two and three dimensional graphic environment for the design of flight procedures. ADES brings together data for the air navigation facilities and obstacles, criteria for the flight procedure design, and information of the physical world to provide an integrated computer environment that replaces the existing manual environment. A carefully designed graphical user interface provides a uniform and simple medium with which the design specialist can communicate. The expert knowledge used in ADES can be modified to adapt the system to different requirements in the present or future. A flexible data management strategy is also used to provide a centralized information data base that can be easily maintained and expanded. There are three distinct parts to the ADES system: the Interactive Design Environment, with software modules for flight procedure design, utilities, data, and graphics; the Design Support Environment, consisting of the Nexpert Object Expert system tools, the INFORMIX Relational Database Management System, and a graphics environment provided by the workstation and proprietary graphics tools; and the external knowledge bases and data bases. A computer aided learning component is also provided to train users and to serve as a refresher for infrequent users. Author (CISTI)

EVALUATION OF CATEGORY 3 MLS DESIGNS **c04**
Rick Cassell, Kelly R. Markin (Mitre Corp., McLean, VA.), and Alex E. Smith *In* Engineering Inst. of Canada, Canadian Conference on Electrical and Computer Engineering, Volumes 1 and 2 1990 4 p (For primary document see N93-30215 11-31)
Avail: Engineering Inst. of Canada, 2050 rue Mansfield, Suite 700, Montreal, Quebec H3A 1Z2 Canada

A key aspect of the implementation of microwave landing systems (MLS) is their compliance with US Federal Aviation Administration and International Civil Aviation Organization requirements for Category 3 landing operations, the lowest visibility operation. Since the landing system is used in such operations as the sole means of guidance, safety is the primary consideration. The safety of the landing system is related to two different items, continuity of service (COS) and integrity. The COS quantifies the probability of maintaining guidance throughout the critical phase of the landing operation. Integrity quantifies the probability of not transmitting potentially hazardous guidance to the aircraft. Three MLS ground equipment design architectures are evaluated for compliance with Category 3 COS and integrity requirements. These designs include a basic design consisting of redundant transmitters and monitors; a second design, the same as the first but with periodic switchover between two transmitters and executive monitors; and a third design, the same as the first except for the addition of a redundant shutdown capability. In addition, tradeoffs between the designs and several alternatives are analyzed. It is shown that relatively small changes in design architecture and implementation can result in large differences in the calculated integrity and COS. Author (CISTI)

STEPS REQUIRED IN THE PURSUIT OF QUANTITATIVE RISK MANAGEMENT PROCESSES FOR HIGH PRESSURE SYSTEMS
T. G. Priddy Jul. 1993 12 p Presented at the Pressure Vessel and Piping Conference, Denver, CO, 25-29 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-007586; SAND-93-0170C; CONF-930702-11) Avail: CASI HC A03/MF A01

Codes and standards have served remarkably well in reducing both the frequency and the consequences of pressure vessel and piping system failures. Past successful uses of safety standards show that safety can indeed be designed into potentially hazardous systems. Operational maintenance and inspection programs can also ensure and perpetuate design and manufactured reliability. However, as more advanced and challenging applications with high pressure systems and potentially hazardous operations are encountered, it is necessary to sharpen our technology, estimate reliability, quantify consequences, and manage risks with cost-effective processes. Practical systems are constructed of several components, and design standards are not always available for every component. A variable level of safety is, therefore, admitted within a system and some assessment of the overall safety is desired. Additionally, when potential personnel safety consequences are large but isolated, secondary protective steps should be considered such as barricading, protective enclosures, or remote operation. Rationale and activities that are based on probabilistic risk assessment (PRA) methods are discussed. While general application of PRA is not advocated at this time, certain derivative parts are suggested for use in closed-loop, risk management activities. DOE

USES OF RISK IMPORTANCE MEASURES [RISKITARKEYSMITAT]
Tuomas Mankamo (Avaplan Oy, Finland.), Kurt Porn (Studsvik Nuclear, Nykoping, Sweden.), and Jan Holmberg May 1991 49 p Sponsored by Ministry of Trade and Industry
(VTT-TIED-1245; ISBN-951-38-3877-3; ETN-93-93772) Copyright Avail: CASI HC A03/MF A01

The definitions, relationships, and interpretations of the three most basic measures of risk importance measures are outlined: risk increase factor, risk decrease factor, and fractional contribution. Risk importance measures provide an understandable and practical way of presenting probabilistic safety analysis results which too often tend to remain abstract numbers without real insight into the content. The fundamental aspect of importance measures is that they express some specific influence of a basic event in the total risk. The basic failure or error events are the elements from which the reliability and risk models are constituted. The importance measures are relative, which is an advantage compared to absolute risk numbers, due to insensitivity with respect to quantification uncertainties. Therefore, they are particularly adapted to give first hand guidance on where to focus the main interest from the system's risk and reliability point of view, and from where to continue the analysis with more sophisticated methods requiring more effort. FREQUENCY DOMAIN SPEECH COMPRESSION USING THE KARHUNEN-LOEVE TRANSFORM M.S. Thesis
Donald W. Dryley Mar. 1993 170 p
(AD-A262613; AFIT/GEO/ENG/93M-02) Avail: CASI HC A08/MF A02

The purpose of this study was to test the influence of phase on the quality of speech reproduced by a speaker dependent compression system. The tests consisted of compressing frequency domain speech vectors using the Karhunen-Loeve Transform, with and without phase, then making subjective judgements as to the reproduced quality. Error Metrics were then tested for their suitability as predictors of reproduced quality. The compression software transformed each speech vector into a vector of complex Fourier coefficients (only half of the coefficients are needed as transform is hermitian). Phase was preserved by using the real frequency components to form one vector and the corresponding imaginary components to form a second vector of real numbers which were then separately compressed. The expanded vectors were recombined and speech reconstructed by Inverse Fourier Transformation. Compression ratios of 8:1 could be achieved without any perceivable difference between the original speech and reconstructed speech by minimizing the MSE of each vector of the pair. The 8:1 Compression Ratio corresponded to a covariance matrix Condition Number of 200. Recommendations for further study into voice characterization and an optimal transform for speech are made. A SURVEY OF NETWORK INTERFACE DESIGNS
Andras Olah 31 Aug. 1992 33 p LIMITED REPRODUCIBILITY: More than 20% of this document may be affected by microfiche quality
(MEMO-INF-92-59; TIOS-92-26; ETN-93-93837) Copyright Avail: CASI HC A03

Due to the protocol processing bottleneck in communication nodes being the most significant limiting factor of high speed networks, solutions for efficient implementations have to be developed. Dedicated hardware implementations can exploit the parallelism inherent in protocol processing. A discussion on network interfaces designed to offload protocol processing from the host computer is presented. The designs are analyzed in order to answer some questions about the necessity of the automatic synthesis of protocol processing hardware. ESA

LARGE AMPLITUDE STRIATIONS IN AN RF DISCHARGE
Teruyuki Sato, Tatsuo Shoji, Youichi Sakawa, and Mitsuyoshi Hori May 1992 14 p
(DE93-753244; PSC-19) Avail: CASI HC A03/MF A01

Paired luminous rings separated by a narrow dark-gap are observed in a radio-frequency discharge. In the discharge, a 0.8 - 5 MHz radio-frequency field with an amplitude of (+-)0.5 - (+-)1.7 kV is applied to two 100 mm wide electrodes, separated by 20 - 100 mm, surrounding a 100 mm diameter pyrex glass tube containing hydrogen gas of 1 - 50 Torr. The number of paired rings, which are axially symmetric with respect to the midplane of two electrodes, increases with the hydrogen gas pressure. The time resolved light intensity measurements show that the outer rings near the electrodes start to appear early in time then the inner rings are produced later. DOE

DEVELOPMENT OF AN AIRBORNE MMW FM-CW RADAR FOR MAPPING RIVER ICE
Norbert E. Yankielum, Michael G. Ferrick, and Patricia B. Weyrick Jan. 1993 15 p
(Contract DACA89-90-K-0003; DA Proj. 4A7-62784-AT-42)
(AD-A262655; CRREL-93-1) Avail: CASI HC A03/MF A01

Analyses of a river's freezeup ice cover stability and its breakup rely on detailed knowledge of the cover's thickness and the variability of that thickness. A high-resolution, millimeter wave (26.5- to 40-GHz) Frequency Modulated-Continuous Wave radar with real-time data acquisition and digital signal processing and display capability was deployed from a low-flying (3-10 m) helicopter to continuously acquire, process and display data during an ice thickness profiling survey of a 24-km study reach. A nominal sheet ice thickness of 50 cm, occasional areas of new ice sheet as thin as 5 cm, open leads, and massive ice accumulations on the order of 5 m thick were encountered. Radar profiling data agreed with ground truth from borehole measurements of the sheet ice, and provided a more detailed view of the ice conditions than that obtained from a low altitude video survey. The radar system provided rapid, safe and accurate data acquisition, allowing detailed mapping of the ice conditions throughout the reach. DTIC

PREDICTING RADIATION CHARACTERISTICS FROM ANTENNA PHYSICAL DIMENSIONS M.S. Thesis
Daniel S. Dietrich Dec. 1992 286 p
(AD-A262462) Avail: CASI HC A13/MF A03

The fundamental theory and equations used in writing a set of software applications which predict antenna radiation parameters are explained. Each application predicts the radiation characteristics of a particular type of antenna over a planar surface which serves as a model of either earth or seawater. The radiation parameter predictions are based solely on an antenna's physical dimensions, the properties of the underlying surface, and electromagnetic theory. Existing electric field equations provide the basis for radiation parameter predictions, and the accuracy of the predicted radiation parameters is totally dependent upon the extent to which the electric field equations used realistically model the actual radiated electromagnetic fields of the antennas. In addition to a review of applicable electromagnetic field theory, this report is also intended to be a user's guide for the corresponding computer applications. The appendices contain computer hardcopies of sample calculations for several antenna types and remarks regarding the conformity of predicted radiation parameters to expectations. Radiation parameters computed thus far are consistent with expectations based on other computational programs and empirical measurements. DTIC

GROUND CLUTTER MEASUREMENTS FOR SURFACE-SITED RADAR
J. B. Billingsley 1 Feb. 1993 96 p
(Contract F19628-90-C-0002)
(AD-A262472; MIT-TR-786-Rev-1; ESC-TR-92-135) Avail: CASI HC A05/MF A01

A large volume of radar ground clutter measurement data was collected from many sites that are widely dispersed over the North American continent. At each site backscatter was recorded from all the terrain within the field of view, typically to ranges extending to 25 or 50 km. As a result, in most of these measurements the angle of illumination of the earth's surface was usually very low, typically within a degree or so of grazing incidence, with much intermittent shadowing of low regions. The nature of low-angle radar ground clutter as it has come to be understood through analysis of this extensive new base of measurements is examined. Depression angle, that is, the angle below the horizontal at which the backscattering terrain point is observed at the radar antenna, is shown to be the principal parametric influence on clutter amplitude statistics, even for the very low angles and small (i.e., typically fractional) variations in angle that occur in surface-sited radar. This principal role of depression angle is the result of its effect on shadowing in a sea of patchy visibility and discrete or localized scattering sources. Following this understanding, a general predictive model for ground clutter spatial amplitude statistics is developed based on very precise computation of depression angle but on only relatively gross specification of terrain type. The important radar parameters entering the model are radar frequency as it affects mean strength of clutter amplitude distributions and spatial resolution as it affects spread in these distributions. MULTIFRACTAL ANALYSIS OF RADIO LOBES Ph.D. Thesis
David Reed DeGraff 1992 241 p
Avail: Univ. Microfilms Order No. DA9309863

The synchrotron surface brightness of several large angular size radio sources (the radio galaxies Cygnus A (at both 6 and 20 centimeters) 3C436, 3C353 (both at 20 cm) as well as the quasar 3C 175 (at 6 cm)) were analyzed in terms of their fractal properties. All the galaxies show remarkably similar fractal spectra, different from those seen in terrestrial examples of hydrodynamic turbulence. The quasar has a slightly different spectrum, more closely resembling terrestrial examples. To reach a physical interpretation of these results, multifractal models were used to simulate synchrotron radio emission in four different cases: (1) a multifractal distribution of electron energies with uniform magnetic field, (2) a multifractal distribution of magnetic field strengths containing a monoenergetic electron distribution, (3) multifractal distribution of electron number densities with uniform magnetic field, and (4) a power law electron energy distribution in a multifractal distribution of magnetic field strengths. With the additional constraint that the simulations produce the observed synchrotron emission spectrum, the fractal spectra of the simulations were compared to the observed fractal spectra of the radio lobes. Only the quasar was well represented by the fractal spectrum both in terms of the width of the spectrum, and the fractal dimension of the minimum and maximum alpha values. The simulations were too wide, and did not have elevated values for f(alpha(sub min)) even when the magnetic fields fractal spectrum f(alpha(sub min)) values were elevated. Multifractal analysis is shown to be a powerful tool for interpreting the turbulence inside the lobes of radio galaxies and quasars. By comparing the fractal spectra of observed radio lobes at different frequencies, to various simulated multifractal spectra, one can infer details of the lobe physics. This will have implications for numerical magnetohydrodynamic (MHD) simulations of these objects. Author (revised)

A CORNER MATCHING AND TRACKING STRATEGY APPLIED TO VIDEOPHONY
Larry S. Shapiro, Han Wang, and J. Michael Brady May 1992 64 p
Sponsored in part by ORS, United Kingdom, and Foundation for Research Development, Republic of South Africa
(OUEL-1933/92; ETN-93-93876) Avail: CASI HC A04/MF A01

The problem of tracking independently moving (and possibly non rigid) objects over long periods of time, where object motion occurs relative to a single camera, is addressed. This research was motivated by the videoconferencing application, which requires a reliable matching algorithm to operate at high speed on lengthy image sequences. Focus is primarily on the low level 'front end' of such a system; the data that emerge are intended to feed into trajectory analysis modules which will group features into coherently moving objects and estimate their three dimensional motion. One such module, to segment moving features from stationary ones, is also described. The study builds upon a previously developed 'corner' finder that runs at 14 Hz on T800 transputers. These 'corners' are curvature extrema in the image intensity surface, and have already served successfully as features in a stereomatching algorithm. This work is extended to the general motion case (single camera), which introduces both benefits and complications: the former because temporal integration facilitates noise resistance and allows ambiguities to be resolved in time, and the latter because objects can change over time in ways they can not change over space alone. The framework presented has two parts: a matcher, which performs short range correspondence on the basis of just two frames, and a tracker, which interprets this information and maintains a spatio-temporal trajectory for each feature. The utility of corners as correspondence tokens is demonstrated and their extraction mechanism is described. The matcher and tracker subsystems are discussed, with a review of relevant literature and experimental results. A simple module to distinguish between moving and stationary points is presented and directions for future research are given. ESA

A PROPOSED APPROACH FOR DEVELOPING NEXT-GENERATION COMPUTATIONAL ELECTROMAGNETICS SOFTWARE
E. K. Miller, R. P. Kruger, and S. Moraites (Simulated Life Systems, Inc., Chambersburg, PA.) 1993 29 p Presented at the 7th Annual Review of Progress in Applied Computational Electromagnetics, Monterey, CA, 19-21 Mar. 1991
(Contract W-7405-eng-36)
(DE93-007326; LA-UR-93-428; CONF-9103123-4) Avail: CASI HC A03/MF A01

Computations have become a tool coequal with mathematics and measurements as a means of performing electromagnetic analysis and design. This is demonstrated by the volume of articles and meeting presentations in which computational electromagnetics (CEM) is routinely employed to address an increasing variety of problems. Yet, in spite of the substantial resources invested in CEM software over the past three decades, little real progress seems to have been made towards providing the EM engineer software tools having a functionality equivalent to that expected of hardware instrumentation. Furthermore, the bulk of CEM software now available is generally of limited applicability to large, complex problems because most modeling codes employ a single field propagator, or analytical form, of Maxwell's Equations. The acknowledged advantages of hybrid models, i.e., those which employ different propagators in differing regions of a problem, are relatively unexploited. The thrust of this discussion is to propose a new approach designed to address both problems outlined above, integrating advances being made in both software and hardware development. After briefly reviewing the evolution of modeling CEM software to date and pointing out the deficiencies thereof, we describe an approach for making CEM tools more truly 'user friendly' called EMSES (Electromagnetic Modeling and Simulation Environment for Systems). This will be achieved through two main avenues. One is developing a common problem-description language implemented in a visual programming environment working together with a translator that produces the specific model description needed by various numerical treatments, in order to optimize user efficiency. The other is to employ a new modeling paradigm based on the idea of field propagators to expedite the development of the hybrid models that are needed to optimize computation efficiency. DOE

HIGH-RESOLUTION SIGNAL SYNTHESIS FOR TIME-FREQUENCY DISTRIBUTIONS
G. S. Cunningham and W. J. Williams 1993 5 p Presented at the IEEE International Conference on Acoustics, Speech, and Signal Processing, Minneapolis, MN, 27-30 Apr. 1993
(Contract W-7405-eng-36)
(DE93-008735; LA-UR-93-638; CONF-930489-2) Avail: CASI HC A01/MF A01

Bilinear time-frequency distributions (TFD's) offer improved resolution over linear nine-frequency representations (TFR's), but many TFD's are costly to evaluate and are not associated with signal synthesis algorithms. Recently, the spectrogram (SP) decomposition and weighted reversal correlator decomposition have been used to define low-cost, high-resolution TFD's. In this paper, we show that the vector-valued 'square-root' of a TFD (VVTFR) provides a representational underpinning for the TFD. By synthesizing signals from modified VVTFR's, we define high-resolution signal synthesis algorithms associated with TFD's. The signal analysis and synthesis packages can be implemented as weighted sums of SP/short-time Fourier Transform signal analysis and synthesis packages, which are widely available, allowing the interested non-specialist easy access to high-resolution methods. A SATELLITE-TRACKING MILLIMETER-WAVE REFLECTOR ANTENNA SYSTEM FOR MOBILE SATELLITE-TRACKING Patent Application
Arthur C. Densmore, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), Vahraz Jamnejad, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), and Kenneth E. Woo, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 30 Nov. 1992 37 p
(Contract NAS7-918)
(NASA-Case-NPO-18772-1-CU; NAS 1.71:NPO-18772-1-CU; US-Patent-Appl-SN-999794) Avail: CASI HC A03/MF A01

A miniature dual-band two-way mobile satellite tracking antenna system mounted on a movable ground vehicle includes a miniature parabolic reflector dish having an elliptical aperture with major and minor elliptical axes aligned horizontally and vertically, respectively, to maximize azimuthal directionality and minimize elevational directionality to an extent corresponding to expected pitch excursions of the movable ground vehicle. A feed-horn has a back end and an open front end facing the reflector dish and has vertical side walls opening out from the back end to the front end at a lesser horn angle and horizontal top and bottom walls opening out from the back end to the front end at a greater horn angle. An RF circuit couples two different signal bands between the feed-horn and the user. An antenna attitude controller maintains an antenna azimuth direction relative to the satellite by rotating it in azimuth in response to sensed yaw motions of the movable ground vehicle so as to compensate for the yaw motions to within a pointing error angle. The controller sinusoidally dithers the antenna through a small azimuth dither angle greater than the pointing error angle while sensing a signal from the satellite received at the reflector dish, and deduces the pointing angle error from dither-induced fluctuations in the received signal. MODIFIED ACOUSTO-OPTIC ADAPTIVE PROCESSOR (MOD-AOAP) Inhouse Report, Feb. 1989 - Jun. 1992
Christopher W. Keefer, John E. Malowicki, and Paul M. Payson Dec. 1992 35 p
(AD-A261983; RL-TR-92-310) Avail: CASI HC A03/MF A01

Multipath jamming noise introduced into a radar antenna's sidelobes effectively reduces the radar's target detection capability. The acousto-optic adaptive processor (AOAP) was developed to demonstrate an optical implementation of the least mean square (LMS) algorithm for adaptively cancelling noise jamming. The AOAP system demonstrated 30 dB cancellation of monotone CW signals, with degraded performance as the bandwidth increased. The liquid crystal light valve (LCLV), used as the integrator/ spatial light modulator in the AOAP, has been identified as limiting system performance. In this report we report on modifications to the AOAP. Specifically, the LCLV has been replaced with a photorefractive crystal. Cancellation performance and cancellation speed of the mod-AOAP are presented and compared to the original results. DTIC

MULTICHANNEL DETECTION OF PARTIALLY CORRELATED SIGNALS IN CLUTTER Inhouse Report, Nov. 1991 - Oct. 1992
James H. Michels Dec. 1992 53 p
(AD-A261984; RL-TR-92-332) Avail: CASI HC A04/MF A01

This report considers the Gaussian multichannel binary detection problem in which the signal and non-white clutter noise are Gaussian vector processes with unknown statistics. A generalized likelihood ratio using multichannel innovations processes is implemented via a model-based approach where the signal and clutter are assumed to be characterized by autoregressive vector processes with arbitrary temporal and cross-channel correlation. The innovations processes are obtained through linear estimation using multichannel parameter estimates. Detection performance is considered as the estimates approach steadystate with increasing data block sample sizes. Results for two-channel signal and clutter noise vectors with various temporal and cross-channel correlation are obtained using a Monte-Carlo procedure. In the transient-state (estimation with limited data), the detection results are considered as a function of the data batch sizes used in parameter estimation. Furthermore, it is noted that the detection performance in the transient-state is related to that of the estimator which, in turn, has its own dependence upon process correlation. The results provide insight regarding the factors which control the processing time requirements to achieve a specified level of detection performance. DTIC

ELECTROMAGNETIC DIFFUSION AND WIRE COUPLING Final Report, Sep. 1987 - Apr. 1988
Bart Goldstein and Rudolf Goldflam Apr. 1993 107 p
(Contract DAAL02-87-C-0113)
(AD-A263183; MRC-R-1156; ARL-CR-54) Avail: CASI HC A06/MF A02

This report documents the research performed to develop physical insight into the coupling of radiated, pulsed, electromagnetic energy to a thin wire located inside a rectangular metallic enclosure. The electromagnetic fields diffuse into the rectangular cavity. The cavity size is not small compared to the wavelengths in the exciting field. A prime objective was to determine how the wire transients will change due to the parameters of cavity size, wire locations and orientation, and incident pulse parameters such as polarization, risetime, and decay time. The approach involved frequency domain analysis based on three distinct frequency regimes: low, intermediate, and high. In the low frequency region the skin depth is larger than the wall thickness of the enclosure. The intermediate region extends to the lowest internal mode of the enclosure. The high frequency region extends upward from the lowest mode. validation of the analytical results, planned under Phase 2 of the SBIR, were not performed. DTIC

An end-to-end microwave receiver system contained in a single miniature hybrid package mounted on a single heatsink is presented. It includes an input end connected to a microwave receiver antenna and an output end which produces a digital count proportional to the amplitude of a signal of a selected microwave frequency band received at the antenna and corresponding to one of the water vapor absorption lines near frequencies of 20 GHz or 30 GHz. The hybrid package is on the order of several centimeters in length and a few centimeters in height and width. The package includes an L-shaped carrier having a base surface, a vertical wall extending up from the base surface and forming a corner therewith, and connection pins extending through the vertical wall. Modular blocks rest on the base surface against the vertical wall and support microwave monolithic integrated circuits on top surfaces thereof connected to the external connection pins. The modular blocks lie end-to-end on the base surface so as to be modularly removable by sliding along the base surface beneath the external connection pins away from the vertical wall.

DEVELOPMENT OF A 9.3 MICROMETER CW LIDAR FOR THE STUDY OF ATMOSPHERIC AEROSOL Final Technical Report, 14 Feb. 1989 - 12 Jan. 1993
B. N. Whiteside and R. M. Schotland 29 Jun. 1993 100 p
(Grant NAG8-766)
(NASA-CR-193227; NAS 1.26:193227) Avail: CASI HC A05/MF A02

This report provides a brief summary of the basic requirements to obtain coherent or heterodyne mixing of the optical radiation backscattered by atmospheric aerosols with that from a fixed frequency source. The

continuous wave (CW) mode of operation for a coherent lidar is reviewed along with the associated lidar transfer equation. A complete optical design of the three major subsystems of a CW, coherent lidar is given. Lens design software is implemented to model and optimize receiver performance. Techniques for the opto-mechanical assembly and some of the critical tolerances of the coherent lidar are provided along with preliminary tests of the subsystems. Included in these tests is a comparison of the experimental and the theoretical average power signal-to-noise ratio. The analog to digital software used to evaluate the power spectrum of the backscattered signal is presented in the Appendix of this report.

WIDEBAND PROPAGATION MEASUREMENTS FOR WIRELESS INDOOR COMMUNICATION
Peter B. Papazian, Yeh Lo, Elizabeth E. Pol, Michael P. Roadifer, Thomas G. Hoople, and Robert J. Achatz Jan. 1993 39 p
(PB93-175123; NTIA-93-292) Avail: CASI HC A03/MF A01

Wideband impulse response measurements were made to characterize proposed radio data channels in three indoor environments. The measurement system employed a 1.5 GHz carrier which was biphase shift key (BPSK) modulated using a 100 Mb/s pseudo-random code. By using a correlation receiver, the channel cophase and quadphase responses were measured and stored for later processing. Data processing included calculation of delay spread, correlation bandwidth (BW), and signal attenuation. The raw data are stored in binary form on tape and disk for further indoor propagation channel studies. NTIS

(Contract NAS5-30313)
(NASA-CR-193274; NAS 1.26:193274; SBIR-07.03-8500) Avail: CASI HC A03/MF A01

This report documents construction and testing of the Interferometric Tracking System project developed under the NASA SBIR contract NAS5-30313. Manuals describing the software and hardware, respectively entitled: 'Field Station Guide to Operations' and 'Field Station Hardware Manual' are included as part of this final report. The objective of this contract was to design, build, and operate a system of three ground stations using Very Long Baseline Interferometry techniques to measure the TDRS orbit. The ground stations receive signals from normal satellite traffic, store these signals in co-located computers, and transmit the information via phone lines to a central processing site which correlates the signals to determine relative time delays. Measurements from another satellite besides TDRS are used to determine clock offsets. A series of such measurements will ultimately be employed to derive the orbital parameters, yielding positions accurate to within 50 meters or possibly better. Author

WAVELET TRANSFORM TECHNIQUES AND SIGNAL ANALYSIS
R. B. Perez (Tennessee Univ., Knoxville.), J. K. Mattingly (Tennessee Univ., Knoxville.), and J. S. Perez (Universidad Politecnica de Madrid, Spain.) 1993 8 p Presented at the American Nuclear Society (ANS) Annual Meeting, San Diego, CA, 20-24 Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE93-007919; CONF-930601-4) Avail: CASI HC A02/MF A01

Traditionally, the most widely used signal analysis tool is the Fourier transform which, by producing power spectral densities (PSD's), allows time dependent signals to be studied in the frequency domain. However, the Fourier transform is global - it extends over the entire time domain - which makes it ill-suited to study nonstationary signals which exhibit local temporal changes in the signal's frequency content. To analyze nonstationary signals, the family of transforms commonly designated as short-time Fourier transforms (STFT's), capable of identifying temporally localized changes in the signal's frequency content, were developed by employing window functions to isolate temporal regions of the signal. For example, the Gabor STFT uses a Gaussian window. However, the applicability of STFT's is limited by various inadequacies. The Wavelet transform (WT), recently developed by Grossman and Morlet and explored in depth by Daubechies and Mallat, remedies the inadequacies of STFT's. Like the Fourier transform, the WT can be implemented as a discrete transform (DWT) or as a continuous (integral) transform (CWT). Some of the potential applications of the wavelet transform algorithms to signal analysis is briefly illustrated.

A COMPARISON OF HIGH-SPEED LINKS, THEIR COMMERCIAL SUPPORT AND ONGOING R/D ACTIVITIES
H. L. Gonzalez, E. Barsotti, S. Zimmermann, M. Nomachi, and O Sasaki Oct. 1992 5 p Presented at the Institute of Electrical and Electronic Engineers (IEEE) Nuclear Science Symposium and Medical Imaging Conference, Orlando, FL, 26-31 Oct. 1992
(Contract DE-AC02-76CH-03000)
(DE93-008134; FNAL/C-92/288; CONF-921005-28) Avail: CASI HC A01/MF A01

Technological advances and a demanding market have forced the development of higher bandwidth communication standards for networks, data links, and busses. Most of these emerging standards are gathering enough momentum that their widespread availability and lower prices are anticipated. The hardware and software that support the physical media for most of these links is currently available, allowing the user community to implement fairly high-bandwidth data links and networks with commercial components. Also, switches needed to support these networks are available or being developed. The commercial support of high-bandwidth data links, networks, and switching fabrics provides a powerful base for the implementation of high-bandwidth data acquisition systems. A large data acquisition system like the one for the Solenoidal Detector Collaboration (SDC) at the SSC can benefit from links and networks that support an integrated systems engineering approach, for initialization, downloading, diagnostics, monitoring, hardware integration, and event data readout. The issue that our current work addresses is the possibility of having a channel/network that satisfies the requirements of an integrated data acquisition system. A brief description of high-speed communication links and protocols that we consider of interest for high energy physics data acquisition systems are presented. The protocols to be covered are High Performance Parallel Interface (HIPPI), Serial HIPPI, Fibre Channel (FC), and Scalable Coherent Interface (SCI). In addition, the initial work required to implement an SDC-like data acquisition system is described. DOE

SPEECH RECOGNITION BY RECURSIVE STOCHASTIC MODELLING Ph.D. Thesis
Joannes Josephus Nijtmans 1992 174 p
(ISBN-90-9005038-8; ETN-93-93576) Copyright Avail: CASI HC A08/MF A02

The application of algorithms for automatic speech recognition is described. Parameters to describe a speech signal were searched for from which log area ratio parameters were chosen. Based on these parameters, a segmentation algorithm was developed. The recognition process was then discussed. A new method was developed based on a new model: the Recursive Markov Model (RMM) which is an extension of the existing Hiddem Markov Model (HMM) and has the advantage of shorter computations, hierarchical modeling, and state sharing. Results of tests of the implemented algorithms are given and the relative merits of the methods of speech recognition are considered. ESA

TIME-INTERPOLATION METHOD FOR DIGITAL BEAMFORMERS Patent
John Green, inventor (to Navy) 2 Mar. 1993 6 p Filed 22 Jan. 1991
(AD-D015709; US-Patent-5,191,546; US-Patent-Appl-SN-643257; US-Patent-Class-364-723) Avail: US Patent and Trademark Office

An improved time-interpolation method for digital time-domain beamformers is provided. The method determines an input channel value at a known fractional delay as a two-stage process. In a first stage, input channel parameters common to all beams and independent of the known fractional delay are determined. In a second stage, the input channel parameters are weighted and summed for each beam to determine the input channel value at the known fractional delay. Weighting of the parameters is based upon the known fractional delay and the frequency band of interest. DTIC

A high data rate over-the-horizon communications capability is provided between two or more platforms at rest or in motion, in the air or on the surface. An RF transmitter/receiver-optical fiber interface unit is launched from a launch platform and is supported via a deployed parachute or balloon to provide a bidirectional RF data link with the launch platform and a bidirectional optical data link over an optical fiber extending to an autonomous vehicle platform, such as a missile. STABILIZED PLATFORM FOR TETHERED BALLOON SOUNDINGS OF BROADBAND LONG- AND SHORT-WAVE RADIATION
J. M. Alzheimer, G. A. Anderson, and C. D. Whiteman Jan. 1993 7 p Presented at the 73rd American Meteorological Society (AMS) Annual Meeting, Anaheim, CA, 17-22 Jan. 1993
(Contract DE-AC06-76RL-01830)
(DE93-007876; PNL-SA-21089; CONF-930133-8) Avail: CASI HC A02/MF A01

Changes in the composition of trace gases in the earth's atmosphere have been reported by many observers, and a general concern has been expressed regarding possible changes to the earth's climate that may be caused by radiatively active gases introduced into the earth's atmosphere by man's activities. Radiatively active trace gases produce temperature changes in the earth's atmosphere through changes in radiative flux divergence. Our knowledge of and means of measuring radiative flux divergence is very limited. A few observations of vertical radiative flux divergences have been reported from aircraft from radiometersondes from towers and from large tethered balloons. These measurement techniques suffer from one or more drawbacks, including shallow sounding depths (towers), high cost (aircraft), complicated logistics (large tethered balloons), and limitation to nighttime hours (radiometersondes). Changes in radiative flux divergence caused by anthropogenic trace gases are expected to be quite small, and will be difficult to measure with existing broadband radiative flux instruments. The emphasis of present research in global climate change is thus being focused on improving radiative transfer algorithms in global climate models. The radiative parameterizations in these models are at an early stage of development and information is needed regarding their performance, especially in cloudy conditions. The impetus for the research reported is the need for a device that can supplement existing means of measuring vertical profiles of long- and short-wave irradiance and radiative flux divergence. A small tethered-balloon-based system that can make radiometric soundings through the atmospheric boundary layer was designed. The concept, the design considerations, and the design and construction of this sounding system are discussed. The performance of the system will be tested in a series of balloon flights scheduled for the fall and winter of 1992. DOE

LEAKY COAXIAL CABLE SIGNAL TRANSMISSION FOR REMOTE FACILITIES
S. F. Smith and R. I. Crutcher 1993 8 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-007916; CONF-930403-20) Avail: CASI HC A02/MF A01

To develop reliable communications methods to meet the rigorous requirements for nuclear hot cells and similar environments, including control of cranes, transporters, and advanced servomanipulators, the Consolidated Fuel Reprocessing Program (CFRP) at Oak Ridge National Laboratory (ORNL) has conducted extensive tests of numerous technologies to determine their applicability to remote operations. To alleviate the need for large bundles of cables that must accommodate crane/transporter motion relative to the boundaries of the cell, several transmission techniques are available, including slotted-line radio-frequency couplers, infrared beams, fiber-optic cables, free-space microwave, and inductively coupled leaky coaxial cable. This paper discusses the general characteristics, mode of operation, and proposed implementation of leaky coaxial cable technology in a waste-handling facility scheduled to be built in the near future at ORNL. In addition, specific system hardware based around the use of leaky coaxial cable is described in detail. Finally, data from a series of radiation exposure tests conducted by the CFRP on several samples of the basic leaky coaxial cable and associated connectors are presented. DOE

THEORETICAL BIT ERROR RATE PERFORMANCE OF THE KALMAN FILTER EXCISOR FOR FM INTERFERENCE
Brian Kozminchuk Dec. 1992 46 p
(AD-A263018; DREO-1163) Avail: CASI HC A03/MF A01

This technical report develops a theoretical bit error rate expression for a Kalman filtering technique that is used for filtering narrowband interferers out of direct sequence spread spectrum signals. The approach is based on the digital phase-locked loop Kalman filter and is close to optimum in so far as demodulating an FM-type of interferer. Because the interference is assumed to be much stronger than either the signal or noise, the Kalman filter locks onto the interference and produces estimates of its phase and envelope. Several assumptions are made in the development of the theoretical bit error rate expression and these are expanded upon. It is shown and illustrated that theory agrees well with simulation as long as the bandwidth of the low pass filter used to determine the envelope of the interference is much less than the sampling rate, otherwise the interference estimate at the input to the interference canceller will have significant cross-correlation with the signal, leading to some cancellation of the spread spectrum signal. SOFTWARE DEVELOPMENT AND ANALYSIS FOR EXPERIMENTAL HIGH FREQUENCY SURFACE WAVE RADAR DATA
H. C. Chan Dec. 1992 59 p
(AD-A261982; DREO-1153) Avail: CASI HC A04/MF A01

Processing software for data collected in an experimental High Frequency Surface Wave Radar (HFSWR) project is implemented in the VAX-3800 computer and the FPS-5000 floating point array process. The software is used to process the data in-house so as to obtain insights in HFSWR sea clutter, noise, and target characteristics. The data are examined to assess quality. Several deficiencies are observed in the data, including 60 Hz power source harmonic interferences and discontinuities in data sequences. Preliminary analysis of some of the data shows that conventional Doppler processing of the data permits the detection of ship and large aircraft targets at fairly long ranges. Plans for further analysis of these data are discussed. DTIC

OPTICAL ANTENNA BEAM STEERING USING DIGITAL PHASE SHIFTER CONTROL Patent
William D. Jemison, inventor (to Navy), R. Herczfeld, inventor (to Navy), and Arthur Paolella, inventor (to Navy) 17 Nov. 1992 11 p Filed 11 Mar. 1992

(AD-D015688; US-Patent-5,164,736; US-Patent-Appl-SN-853229; US-Patent-Class-342-368) Avail: US Patent and Trademark Office

A method and system for steering an antenna beam are provided. A light source emits light wherein at least one parameter of the emitted light is modulated. Modulated light is received by an optical detector and an analog control signal is provided by the optical detector in response to the modulated parameter. The control signal is applied to an analog-to-digital converter to convert the signal from analog to digital. The digital converter output signal is applied to a digital phase shifter for controlling the phase shift of the phase shifter and thereby steering an antenna beam according to the modulated parameter. The modulated parameter may be, for example, the intensity of the emitted light or the frequency of the emitted light. A plurality of converters and phase shifters may be provided for steering of phased array antennas. DTIC

PLANAR MICROSTRIP YAGI ANTENNA ARRAY Patent

John Huang, inventor (to NASA) 15 Jun. 1993 10 p Filed 28 Feb. 1991 Continuation-in-part of abandoned US-Patent-Appl-SN-501892, filed 30 Mar. 1990
(NASA-Case-NPO-17873-2-CU; US-Patent-5,220,335; US-Patent-Appl-SN-664445; US-Patent-Appl-SN-501892; US-Patent-Class-343-700MS; US-Patent-Class-343-819; US-Patent-Class-343-833; US-Patent-Class-343-834; Int-Patent-Class-H01Q-1/380; Int-Patent-Class-H01Q-19/300) Avail: US Patent and Trademark Office

A directional microstrip antenna includes a driven patch surrounded by an isolated reflector and one or more coplanar directors, all separated from a ground plane on the order of 0.1 wavelength or less to provide end fire beam directivity without requiring power dividers or phase shifters. The antenna may be driven at a feed point a distance from the center of the driven patch in accordance with conventional microstrip antenna design practices for H-plane coupled or horizontally polarized signals. The feed point for E-plane coupled or vertically polarized signals is at a greater distance from the center than the first distance. This feed point is also used for one of the feed signals for circularly polarized signals. The phase shift between signals applied to feed points for circularly polarized signals must be greater than the conventionally required 90 degrees and depends upon the antenna configuration.

FEMTOSECOND CARRIER PROCESSES IN COMPOUND SEMICONDUCTORS AND REAL TIME SIGNAL PROCESSING Annual Report, 1 May 1992 - 30 Apr. 1993

J. P. Krusius 10 Mar. 1993 59 p
(Contract F49620-90-C-0039)
(AD-A262966) Avail: CASI HC A04/MF A01

This report is the annual report on research conducted under the auspices of the Joint Services Electronics Program at Cornell University. The research is grouped under two themes: (1) femtosecond carrier processes in compound semiconductors, and (2) real time signal processing. Results on OMVPE materials growth, femtosecond laser probing of hot carriers, and ensemble Monte Carlo simulations are reported on under the first theme. Accomplishments on VLSI algorithms, fault tolerance architectures, and architectures with multiple functional units for signal processing are given under the second theme. DTIC

THE TELECOMMUNICATIONS AND DATA ACQUISITION REPORT Progress Report, Jan. - Mar. 1993

Edward C. Posner, ed. 15 May 1993 209 p
(NASA-CR-193144; TDA-PR-42-113; NAS 1.26:193144) Avail: CASI HC A10/MF A03

This quarterly publication provides archival reports on developments in programs managed by JPL's Office of Telecommunications and Data Acquisition (TDA) in the following areas: space communications, radio navigation, radio science, and ground-based radio and radar astronomy. This document also reports on the activities of the Deep Space Network (DSN) in planning, supporting research and technology, implementation, and operations. Also included are standards activity at JPL for space data and information systems and reimbursable DSN work performed for other space agencies through NASA. The preceding work is all performed for NASA's Office of Space Communications (OSC). The TDA Office also performs work funded by another NASA program office through and with the cooperation of OSC. This is the Orbital Debris Radar Program with the Office of Space Systems Development. For individual titles, see N93-29587 through N93-29603.

AN IMPROVED LINEAR ION TRAP PHYSICS PACKAGE

J. D. Prestage *In its* The Telecommunications and Data Acquisition Report 15 May 1993 p 1-6 (For primary document see N93-29586 11-32)
(RTOP 310-10-62-15)
Avail: CASI HC A02/MF A03

This article describes an improvement in the architecture of the physics package used in the Linear Ion Trap (LIT)-based frequency standard recently developed at JPL. This new design is based on the observation that ions can be moved along the axis of an LIT by applied dc voltages. The state selection and interrogation region can be separated from the more critical microwave resonance region where the multiplied local oscillator signal is compared with the stable atomic transition. This separation relaxes many of the design constraints of the present units. Improvements include increased frequency stability and a substantial reduction in size, mass, and cost of the final frequency standard. Author (revised)

THE EFFECT OF CLOCK, MEDIA, AND STATION LOCATION ERRORS ON DOPPLER MEASUREMENT ACCURACY c04

J. K. Miller *In its* The Telecommunications and Data Acquisition Report 15 May 1993 p 7-21 (For primary document see N93-29586 11-32)
(RTOP 310-10-63-84-02)
Avail: CASI HC A03/MF A03

Doppler tracking by the Deep Space Network (DSN) is the primary radio metric data type used by navigation to determine the orbit of a spacecraft. The accuracy normally attributed to orbits determined exclusively with Doppler data is about 0.5 microradians in geocentric angle. Recently, the Doppler measurement system has evolved to a high degree of precision primarily because of tracking at X-band frequencies (7.2 to 8.5 GHz). However, the orbit determination system has not been able to fully utilize this improved measurement accuracy because of calibration errors associated with transmission media, the location of tracking stations on the Earth's surface, the orientation of the Earth as an observing platform, and timekeeping. With the introduction of Global Positioning System (GPS) data, it may be possible to remove a significant error associated with the troposphere. In this article, the effect of various calibration errors associated with transmission media, Earth platform parameters, and clocks are examined. With the introduction of GPS calibrations, it is predicted that a Doppler tracking accuracy of 0.05 microradians is achievable.

PRECISE TRACKING OF THE MAGELLAN AND PIONEER VENUS ORBITERS BY SAME-BEAM INTERFEROMETRY. PART 2: ORBIT DETERMINATION ANALYSIS c13

W. M. Folkner, J. S. Border, S. Nandi, and K. S. Zukor *In its* The Telecommunications and Data Acquisition Report 15 May 1993 p 22-36 (For primary document see N93-29586 11-32)
(RTOP 310-10-63-88-01)
Avail: CASI HC A03/MF A03

A new radio metric positioning technique has demonstrated improved orbit determination accuracy for the Magellan and Pioneer Venus Orbiter orbiters. The new technique, known as Same-Beam Interferometry (SBI), is applicable to the positioning of multiple planetary rovers, landers, and orbiters which may simultaneously be observed in the same beamwidth of Earth-based radio antennas. Measurements of carrier phase are differenced between spacecraft and between receiving stations to determine the plane-of-sky components of the separation vector(s) between the spacecraft. The SBI measurements complement the information contained in line-of-sight Doppler measurements, leading to improved orbit determination accuracy. Orbit determination solutions have been obtained for a number of 48-hour data arcs using combinations of Doppler, differenced-Doppler, and SBI data acquired in the spring of 1991. Orbit determination accuracy is assessed by comparing orbit solutions from adjacent data arcs. The orbit solution differences are shown to agree with expected orbit determination uncertainties. The results from this demonstration show that the orbit determination accuracy for Magellan obtained by using Doppler plus SBI data is better than the accuracy achieved using Doppler plus differenced-Doppler by a factor of four and better than the accuracy achieved using only Doppler by a factor of eighteen. The orbit determination accuracy for Pioneer Venus Orbiter using Doppler plus SBI data is better than the accuracy using only Doppler data by 30 percent. Author

EXPERIMENTAL AND MODAL VERIFICATION OF AN INTEGRAL EQUATION SOLUTION FOR A THIN-WALLED DICHROIC PLATE WITH CROSS-SHAPED HOLES c33
L. W. Epp and P. H. Stanton *In its* The Telecommunications and Data Acquisition Report 15 May 1993 p 46-62 (For primary document see N93-29586 11-32)
(RTOP 310-20-64-86-02)
Avail: CASI HC A03/MF A03

In order to add the capability of an X-band uplink onto the 70-m antenna, a new dichroic plate is needed to replace the Pyle-guide-shaped dichroic plate currently in use. The replacement dichroic plate must exhibit an additional passband at the new uplink frequency of 7.165 GHz, while still maintaining a passband at the existing downlink frequency of 8.425 GHz. Because of the wide frequency separation of these two passbands, conventional methods of designing air-filled dichroic plates exhibit grating lobe problems. A new method of solving this problem by using a dichroic plate with cross-shaped holes is presented and verified experimentally. Two checks of the integral equation solution are described. One is the comparison to a modal analysis for the limiting cross shape of a square hole. As a final check, a prototype dichroic plate with cross-shaped holes was built and measured. Author (revised)

UNCORRECTABLE SEQUENCES AND TELECOMMAND
Laura Ekroot, R. McEliece (California Inst. of Tech., Pasadena.), S. Dolinar, and L. Swanson *In its* The Telecommunications and Data Acquisition Report 15 May 1993 p 99-105 (For primary document see N93-29586 11-32)
(RTOP 310-30-71-83-04)
Avail: CASI HC A02/MF A03

The purpose of a tail sequence for command link transmission units is to fail to decode, so that the command decoder will begin searching for the start of the next unit. A tail sequence used by several missions and recommended for this purpose by the Consultative Committee on Space Data Standards is analyzed. A single channel error can cause the sequence to decode. An alternative sequence requiring at least two channel errors before it can possibly decode is presented. (No sequence requiring more than two channel errors before it can possibly decode exists for this code.) Author

Avail: CASI HC A03/MF A03

The 28 Jun. 1992 Landers earthquake ground motion records at the Echo site (DSS-12 antenna) were adjusted to provide a better match with spectra from the measured Mars site (DSS-14 antenna) instrument tower response. A finite-element model of the antenna structural system was analyzed for response to this ground motion. Dynamic forces and displacements were computed in the locality of components that had failed during the earthquake. Calculated forces in the range of 30,000 to 35,000 lb on failed Y-axis actuator U-joints were consistent with laboratory load tests. The load capacity of these joints was found to be below the range of 34,000 to 42,000 lb. Dynamic amplification factors of from 6 to 16 were computed for the quadripod apex accelerations with respect to the ground accelerations. The largest factor--25--was found at the outboard end of the X-actuator. Author (revised)

THE FLIGHT PERFORMANCE OF THE GALILEO ORBITER USO
D. D. Morabito, T. P. Krisher, and S. W. Asmar *In its* The Telecommunications and Data Acquisition Report 15 May 1993 p 184-202 (For primary document see N93-29586 11-32)
(RTOP 314-40-31-30-26; RTOP 889-54-62-01)
Avail: CASI HC A03/MF A03

Results are presented in this article from an analysis of radio metric data received by the DSN stations from the Galileo spacecraft using an Ultrastable Oscillator (USO) as a signal source. These results allow the health and performance of the Galileo USO to be evaluated, and are used to calibrate this Radio Science instrument and the data acquired for Radio Science experiments such as the Redshift Observation, Solar Conjunction, and Jovian occultations. Estimates for the USO-referenced, spacecraft-transmitted frequency and frequency stability were made for 82 data acquisition passes conducted between launch (Oct. 1989) and Nov. 1991. Analyses of the spacecraft-transmitted frequencies show that the USO is behaving as expected. The USO was powered off and then back on in Aug. 1991 with no adverse effect on its performance. The frequency stabilities measured by Allan deviation are consistent with expected values due to thermal wideband noise and the USO itself at the appropriate time intervals. The Galileo USO appears to be healthy and functioning normally in a reasonable manner. Author (revised)

RTE: A UNIX LIBRARY WITH ON-LINE DOCUMENTATION AND SAMPLE PROGRAMS FOR MICROWAVE RADIATIVE TRANSFER CALCULATIONS
J. C. Reynolds and J. A. Schroeder Mar. 1993 92 p See also PB92-129931 and PB92-227198 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-180248; NOAA-TM-ERL-WPL-229) Avail: CASI HC A05

The FORTRAN library that the NOAA Wave Propagation Laboratory (WPL) developed to perform radiative transfer calculations for an upward-looking microwave radiometer is described. Although the theory and algorithms have been used for many years in WPL radiometer research, the Radiative Transfer Equation (RTE) software has combined them into a toolbox that is portable, readable, application independent, and easy to update. RTE has been optimized for the UNIX environment. However, the FORTRAN source code can be compiled on any platform that provides a Standard FORTRAN 77 compiler. RTE allows a user to do cloud modeling, calibrate radiometers, simulate hypothetical radiometer systems, develop retrieval techniques, and compute weighting functions. The radiative transfer model used is valid for channel frequencies below 1000 GHz in clear conditions and for frequencies below 100 GHz when clouds are present. NTIS

OPTIMIZATION OF HPM DEVICE PARAMETERS FOR MAXIMUM AIR TRANSMISSION
R. Roussel-Dupre and T. Tunnell (EG and G Energy Measurements, Inc., Los Alamos, NM.) 1993 23 p Presented at the International Society for Optical Engineering (SPIE) Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract W-7405-eng-36)
(DE93-007332; LA-UR-93-361; CONF-930159-17) Avail: CASI HC A03/MF A01

The propagation of high-power microwave (HPM) pulses through the atmosphere is a subject that has received renewed attention in the last decade. For sufficiently high-power pulses, it is possible for air breakdown to be initiated by the front end of the pulse and for ohmic dissipation of the tail end to proceed as the tail propagates through the newly created plasma. Generally, this nonlinear process termed tail erosion is modeled with time-dependent fluid or kinetic codes that require a fine mesh of range and time points. The computational time to run these codes, however, precludes their use in determining the optimum pulse characteristics and propagation paths for transmission of a desired fluence. In this paper, a new frequency scaling law that greatly reduces computational requirements and at the same time incorporates the nonlinear effects inherent to HPM propagation is discussed. Results of a comparison between predictions of air breakdown thresholds made using the frequency scaling law and experimental data taken at various frequencies are presented. The scaling law is implemented in an existing HPM propagation code and has been used recently to develop a new predictive capability that calculates the optimum energy, power, and antenna requirements necessary to transmit a desired fluence. These capabilities provide both the accuracy and rapid computational turnaround necessary for system studies that assess the effects of HPM propagation for particular HPM devices and that attempt to open device parameters for maximum air transmission. Samples of both forward propagation, predictive calculations, and inverse, optimization calculations are presented. DOE

PLANAR ACTIVE ANTENNAS AND QUASI-OPTICAL POWER COMBINING ARRAYS USING FET'S AND SLOTS
Shigeo Kawasaki and Tatsuo Itoh 20 Mar. 1993 161 p
(Contract DAAH04-93-G-0068)
(AD-A263759; UCLA-ENG-93-22; ARO-30921.1-EL) Avail: CASI HC A08/MF A02

This report presents design concepts and experimental data for planar active antenna and quasi-optical power combining arrays with strong coupling to realize a compact and low-cost radar and communication system. The prototype circuits for this purpose were made in a layered configuration using microstrip lines and in a uniplanar structure using CPW's. As an active source, an FET was selected. As a unit cell of the power combining array, a single layered active antenna using microstrip lines and slots was fabricated. In the design, small signal S-parameters were used to determine the circuit configuration while a large signal analysis to the entire circuit involving the slot antenna input impedance was carried out. The circuit designed for 10 GHz was found to operate at 9.3 GHz and the other designed for 25 GHz at 24 GHz. In addition, the circuit with CPW's and slots designed for 10 GHz was found to operate at 8.6 GHz. Based on these successful results, linear power combining arrays were made. For the strong coupling, each oscillator output is connected by a single transmission line. Several 6-element microstrip arrays and a 4-element CPW array were fabricated. In the former, sharp main beams were obtained. To obtain a millimeter-wave operating frequency, the second harmonic spatial power combining array made with FET's were demonstrated around 40 GHz. To show a topology of a 2-dimensional array, a 16-element dual polarized array at 7.8 GEL was made. To obtain the maximum in-phase radiation signal, impedance matching, a phase of the radiation signal and a signal phase of each oscillator were taken into account. DTIC

WIDEBANDING TECHNIQUES FOR VHF ANTENNAS 2 Technical Report, 10 Jan. 1992 - 30 Mar. 1993
Keem B. Thiem and Ramakrishna Janaswamy Mar. 1993 140 p
(AD-A263998; NPSEC-93-007) Avail: CASI HC A07/MF A02

For a variety of mechanical and electrical reasons, the U.S. Army prefers to use a wire antenna for its mobile applications in the HF and VHF bands. However, due to the rapid fluctuation of impedance with frequency, a simple wire antenna is not suitable. This research will look into the aspects of electronic switching of the antenna length and electronic switching of the accompanying tuning network for frequency hopping applications. Two separate schemes will be studied. The first one involves a chosen wire antenna loaded with PIN diodes. The diodes will be selectively switched ON or OFF at different frequencies to control the input impedance of the antenna. In the second scheme, a monopole antenna of fixed length will be considered and data on its input impedance over many sub-bands within 30 to 90 MHz will be generated. Tuning networks composed of resistors, inductors, and capacitors will be designed over each sub-band. The various networks will then be connected via PIN diodes and selectively switched to provide matching over a much wider band. DTIC

ETHERNET PERFORMANCE OF THE MOTOROLA ALTAIR WIN SYSTEM Final Report
Marie B. Normoyle Mar. 1993 42 p
(Contract F19628-89-C-0001)
(AD-A263877; MTR-92B0000122; ESC-TR-92-276) Avail: CASI HC A03/MF A01

Wireless networks offer an attractive alternative to physical cabling for rapid deployment systems. These networks emphasize ease of installation and configuration maintenance. The Motorola Altair wireless in-building network (WIN) offers the additional benefit of compatibility with existing Ethernet devices and wired segments, allowing it to grow as required. Tests were performed to determine the performance capabilities of the WIN system versus wired-Ethernet-configurations. For these tests, the WIN components were integrated into several typical Ethernet topologies that were compared against equivalent wired topologies. Performance was measured using the elapsed time required for a single file transfer as simulated background traffic was increased. Results show that for average Ethernet utilization under 2 Mbits per second, the WIN system performs as well as a wired topology, although individual instances of poor performance may be experienced. In topologies where traffic is routed across a path operating at less than 2 Mbits per second, such as T1 data link, the WIN system is essentially transparent to the network. Performance within the WIN microcell is optimum for handshaking protocols implemented with small to medium-sized Ethernet packets. DTIC

The symposium dealt with small satellites used for tactical applications that might be of value to NATO. The 11 sessions covered TacSat concepts and needs, aspects of TacSat applications, TacSat system applications, communication concepts, launch systems, spacecraft bus, advanced technology, radar concepts, electro-optics concepts, and two panel discussions. The information generated by the symposium will be used by Working Group 16 to report on the utility of such satellites and applications to meet future NATO needs. For individual titles, see N93-29893 through N93-29913.

The concept of a Tactical Space System (TACSAT) is a means to provide a rapid, on demand, augmentation of the backbone U.S. military space systems. Such augmentation would be valuable to temporarily replace lost capability or in times of crisis, to accommodate surge demands. Because augmentation needs are not always known a-priori, it would be desirable to be able to rapidly constitute the appropriate payload-satellite bus combination to accommodate the need for a specific space capability. To do this, one can envision a standard bus capable of accepting a variety of payloads, or better yet, a single spacecraft designed to perform several different missions. Both options are considered. A number of potential missions exist in the areas of surveillance, navigation, environmental sensing, and communications. Of these, two are presented as strawman concepts: surveillance and communication. For surveillance, an electro-optical payload is described that could be used for missile surveillance, theater targeting, or weather data using the same optics, focal plane, and processor. The satellite orbit selected dictates which mission is performed. For communication, both SHF and EHF payloads are defined to provide theater coverage for the tactical user. The advantages and penalties that accrue to the use of a common bus are also explored. In addition, launch options are identified and a comparison made between 'launch-on-demand' and 'launch-on-schedule' strategies. Potential timelines for rapid launch are shown based on parallel processing and checkout of spacecraft and launcher. This technique is compared with launching satellites on a routine basis and storing them in orbit. Energy requirements for repositioning these stored satellites after they are activated in time of need are defined.

The potential exploitation of TACSATs is limited by a vicious circle in which users do not specify requirements which they believe to be infeasible and the space industry does not offer radically new solutions because it perceives no demand. This is the Catch 22 of the title. This paper aims to show some of the possibilities if we break out of that vicious circle. A private civilian Earth observation mission (SeaStar) is adopted as a baseline. In order to illustrate what might be possible, military payloads for surveillance, verification, and C3I are suggested, derived from land or air bases systems that either already exist or are known to be under development. It must be appreciated that these are not presented as proposed designs, merely as a kind of 'existence proof' for high performance and low cost satellites. It is possible, on the basis of this 'existence proof', to explore some of the operational consequences of the more general use of TACSATs.

This paper addresses the concept of a satellite based system serving the needs of tactical users for direct access to communications and various forms of surveillance. Such a system must take account of the most effective methods for deployment and maintenance during its intended period of operation. In terms of the mission needs, the Tactical Satellite System (TACSAT) is required to provide the services for tactical users over a relatively small region of maybe some 1000-2000 km diameter. Also, the concept is likely to involve relatively short periods of operation of about 3 to 6 months for a typical operation scenario. The paper, therefore, addresses a system concept in which the emphasis is placed on reducing the scale of the logistics involved in the deployment of TACSAT elements and simplifying the ground operations and facilities necessary for the users to gain access to the services provided. This paper addresses the following: (1) the need for 'launch on demand'; (2) the possibility of launches being directly under the control of the area commander; (3) operating concepts for TACSATs, comparing the approach of launch-via-residual-mass as part of a larger mission, not dedicated to the TACSAT mission with the approach of dedicated, launch-on-demand; (4) identification of information flow requirements for TACSAT integrity and status evaluation and for surveillance data recovery; (5) determination of technical and cost drivers influencing the form and cost of ground installation and logistic issues; (6) integration of TACSAT facilities and services with other communications and surveillance systems available to the Tactical Commander; and (7) investigation of techniques minimize the ground control and data collection overhead.

The object of this presentation is to propose a navigation system functioning according to the same principle as the GPS system but which would offer a permanent service in Europe using a limited number of satellites. The constellation presented here requires only 4 satellites including one geostationary and three satellites on geosynchronous orbits of weak inclination and eccentricity. This constellation makes it possible to completely cover Europe, the Middle-East and Africa. Moreover, the use of relatively simple satellites is possible. Indeed, all the satellites being permanently visible from the same point of the globe, it is possible to leave on the ground the ultrastable clock which provides the time reference for measurements of user-satellite distance. This constellation appears promising and a more thorough analysis is in hand in order to judge the feasibility of such a system. In particular, the problems arising from the setting and the maintenance in position of such a constellation are being analyzed right now. Several possible solutions for the installation, with single or multiple launches, from standard transfer orbits or not, are presented here. In order to provide a first evaluation of the cost of maintaining it in position, the influence of the main disturbances of orbit on the service provided was analyzed. Some examples of the maintenance in position are also provided. Transl. by FLS

The National Delegates Board of AGARD, upon recommendation by the Avionics Panel of AGARD, approved in March 1986 the establishment of WG-13 to study satellite communications for NATO under the direction of Prof. Dr. Nejat Ince of Turkey. Some 14 scientists/engineers, from research and industrial establishments of Canada, France, the Federal

Republic of Germany, Norway, Turkey, the United Kingdom, the United States of America as well as from International Military Staff of NATO and SHAPE Technical Centre, participated in the work of WG-13. This paper is a brief summary of the studies carried out by the group in the period 1988-1990 on the type of satellite communication systems which NATO can have in the post-2000 era including the critical techniques and technologies that need to be developed for this purpose.

The communications capabilities provided by EHF satellites can range from low data rate services (75 to 2400 bps per channel) to medium data rate links (4.8 kbps to 1.544 Mbps per link) depending on the payload configuration. Through the use of EHF waveform standards, the EHF payloads will be compatible with existing and planned EHF terminals. Advanced technologies permit the development of highly capable, lightweight payloads which can be utilized in a variety of roles. The key payload technologies include adaptive uplink antennas; high speed, low power digital signal processing subsystems; lightweight frequency hopping synthesizers; and efficient solid-state transmitters. The focus in this paper is on the signal processing and frequency generation technologies and their application in a lightweight EHF payload for tactical applications. Author

In the area of MILSATCOM, considerable effort is currently being expended on the development of systems operating in the EHF frequency bands and employing onboard processing. Two of the principal advantages of employing these features are that the MILSATCOM system will be capable of increased throughput and will possess increased immunity to jamming and other channel impairments. Most of the previous research and development in EHF MILSATCOM has concentrated on Low Data Rate (LDR) waveforms, for data rates up to 2.4 kbps. In order to meet the requirements for increased throughput, Medium Data Rate (MDR) waveforms are being developed. These systems include data rates up to and including T1. This paper examines the constraints that communicating at MDR data rates places on synchronization and provides an overview of some of the various techniques and algorithms that can be employed for both spatial and time acquisition as well as tracking. Both channel and equipment impairments affecting synchronization are examined. Robust open and closed loop acquisition and tracking algorithms are examined in conjunction with onboard processing techniques. Performance is discussed in terms of SNR, acquisition time, probability of correct acquisition and probability of false acquisition. Tradeoffs in a MILSATCOM system design based on various user requirements are also presented. Author

TERRAIN AND COVERAGE PREDICTION ANALYSES FOR NON-GEOSTATIONARY ORBIT EHF SATELLITE COMMUNICATIONS

M. Jamil Ahmed *In* AGARD, TacSats for Surveillance Verification and C3I Feb. 1993 11 p (For primary document see N93-29892 11-32)
Copyright Avail: CASI HC A03/MF A03

This paper examines communications coverage from five non-geostationary satellite orbits. These orbits are as follows: circular inclined synchronous; GPS; Molniya 12 and 24 hour; and Tundra orbits. It also shows the increase in propagation loss due to irregular terrain and the foliage loss at mm waves, as well as the combined effect of terrain and foliage on satellite view duration. It is concluded that coverage calculations for EHF satcom earth terminals need to take into account terrain and foliage losses. Author (revised)

The need for tacsats is discussed, and typical tacsat mission requirements are identified. A spectrum of potential tacsat launch systems is identified and characterized, including both U.S. and non-U.S. systems, and ranging from existing operational vehicles to very advanced vehicles that will not become available until well into the next century. The six basic launch system design drivers are presented: performance, cost, operability, launch responsiveness, launch flexibility, and survivability. These design drivers are discussed as they relate to tacsat launch requirements. The launch systems that are described are placed in the following categories: (1) mainline launch systems; (2) small fixed/relocatable/mobile launch systems; (3) ballistic missile-derived launch systems; and (4) far-term launch systems. The impact of the U.S./CIS Strategic Arms Reduction Talks (START) agreements on the availability of surplus ballistic missiles is discussed. The availability and utility of a wide selection of global launch sites are also examined. It is concluded that the general tacsat mission is a viable concept, and possibly satisfies a very critical future need. It is demonstrated that the tacsat launch services needs into the foreseeable future can be supported by current and planned launch systems launched from existing launch sites. However, numerous other options are available and should be investigated by the tacsat system designer/planner for viability and cost effectiveness. Author (revised)

SPACECRAFT AND LAUNCH SYSTEMS FOR TACSAT APPLICATIONS c18

Chris Schade, Gilbert D. Rye, and Robert H. Meurer *In* AGARD, TacSats for Surveillance Verification and C3I Feb. 1993 11 p (For primary document see N93-29892 11-32)
Copyright Avail: CASI HC A03/MF A03

The ability of a tactical communication satellite (TACSAT) space system to fulfill its mission application with the desired capability, responsiveness, reliability, and survivability, while at the same time achieving low cost objectives, is a tremendous challenge that can only be met if all of the system segments - launch, space, and ground - contribute to meeting mission unique requirements. The emerging concepts for the development, deployment, and operation of cost-effective TACSAT space systems are especially dependent on the flexibility and operability of their launch vehicle and spacecraft bus systems. Orbital Sciences Corporation (OSC) has privately developed two flexible yet cost-effective space launch vehicles--Pegasus (TM) and Taurus (TM)--with significant and unique operational capabilities that enable TACSAT space systems to meet these challenges. The Defense Advanced Research Projects Agency (DARPA) has sponsored the first launch of both systems, with follow-on launches scheduled in support of U.S. Air Force, NASA, SDIO, and commercial programs. In addition, OSC has developed a flexible, cost-effective, spacecraft bus--PegaStar (TM)--that makes common use of the Pegasus or Taurus final stage avionics and structure in an integrated systems approach, thereby optimizing the mass and volume available for payload sensors. PegaStar spacecraft for the Air Force and NASA are now in engineering and production. Author (revised)

QuickStar: SYSTEM DESIGN, CAPABILITIES, AND TACTICAL APPLICATIONS OF A SMALL, SMART SPACE SYSTEM c18

Thomas P. Garrison and Neal T. Anderson *In* AGARD, TacSats for Surveillance Verification and C3I Feb. 1993 12 p (For primary document see N93-29892 11-32)
Copyright Avail: CASI HC A03/MF A03

The QuickStar System is not a concept--it is a flight-proven design. QuickStar is a small, highly capable, low-cost, lightweight spacecraft using modern design techniques that can carry tactical assets into space at a tenth of the cost of current systems. System design, relevant technologies, payload capabilities (mass, power, data rate, pointing, volume), and tactical mission applications of this lightweight satellite are described. As part of the overall small satellite system architecture, a portable, low-cost multipurpose ground station to support production, test, launch, and orbit operations of the space segment is also available. The versatility and transportability built into the ground station allows placement at any government installation or field site. The prototype QuickStar space segment was developed to ride as a secondary payload on a McDonnell Douglas Delta 2 series expendable launch vehicle (ELV). With the extra performance provided by the Delta 2 or other ELV of similar configuration, as many as four satellites could be orbited at one time. In addition, the paper describes a QuickStar satellite configuration, incorporating the same subsystems and capabilities as the prototype QuickStar, designed for stand-alone ELV (Scout or Pegasus) launchings. The program schedule for the design, fabrication, and test of a QuickStar satellite system reflects the fast-paced environment of a low-cost program. Minimal paper and much concurrent engineering goes into a schedule that provides a flight-ready spacecraft and supporting ground station in only 15 months. Author (revised)

The paper reviews the advantages and limitations of electric propulsion for lightsats characterized by a launch mass in the 300 to 800 kg range. The considered systems include ion propulsion, arc jets, and stationary plasma thrusters for different applications such as drag compensation, orbit raising, fine trimming of orbital parameters, and various orbit transfers. Electric propulsion provides substantial mass savings and turns out to be an enabling technology for certain lightsat missions. The constraints resulting from DC power limitations on board small satellites are discussed, along with the implications on candidate technologies and system solutions. A review of near term prospectives of low power ion thrusters, for lightsats applications, concludes the paper. Author (revised)

The Defense Advanced Research Projects Agency (DARPA) is the central research and development organization of the DoD and, as such, has the primary responsibility for the maintenance of U.S. technological superiority over potential adversaries. DARPA's programs focus on technology development and proof-of-concept demonstrations of both evolutionary and revolutionary approaches for improved strategic, conventional, rapid deployment and sea power forces, and on the scientific investigation into advanced basic technologies of the future. DARPA can move quickly to exploit new ideas and concepts by working directly with industry and universities. For four years, DARPA's Advanced Space Technology Program (ASTP) has addressed various ways to improve the performance of small satellites and launch vehicles. The advanced technologies that are being and will be developed by DARPA for small satellites can be used just as easily on large satellites. The primary objective of the ASTP is to enhance support to operational commanders by developing and applying advanced technologies that will provide cost-effective, timely, flexible, and responsive space systems. Fundamental to the ASTP effort is finding new ways to do business with the goal of quickly inserting new technologies into DoD space systems while reducing cost. In our view, these methods are prime examples of what may be termed 'technology leveraging.' The ASTP has initiated over 50 technology projects, many of which were completed and transitioned to users. The objectives are to quickly qualify these higher risk technologies for use on future programs and reduce the risk of inserting these technologies into major systems, and to provide the miniaturized systems that would enable smaller satellites to have significant - rather than limited - capability. Only a few of the advanced technologies are described, the majority of which are applicable to both large and small satellites. Derived from text

The feasibility of installing SAR's on board lightsats for tactical and strategic observation missions is discussed, emphasizing high resolution and short revisit intervals as main system drivers. Lightsat constellations design criteria are presented for both global and limited latitude belt coverage. Pros and cons of sunsynchronous versus medium inclination non-sunsynchronous orbits are discussed. Gross system trade offs for the SAR sensor are then addressed, in the specific context of a resource-limited lightsat, stressing the achievement of resolutions better than 5 m, swaths greater than 20 Km, access angles of at least 30 deg, small antenna dimensions, and a reasonable power consumption. Both X and C band SAR solutions are outlined. Data transmission alternatives are also discussed, in the context of tactical and strategic scenarios, outlining their projected performance. Constellation orbits control and platform attitude are also addressed for their impact on mission, SAR image quality and satellite design requirements. Key aspects of critical platform subsystems are also identified. Author (revised)

The payload concept covered is that of a low cost, high performance radar sensor capable of detecting and recognizing static objects within an imaged scene of the Earth's surface using the Synthetic Aperture Radar (SAR) technique. The overall system is integrated with a TACSAT platform in Low Earth Orbit (LEO) and, although only passing reference is made to this feature, the radar could also have a capability for the detection of Ground Moving Targets (GMTI). A parametric review of such a sensor in the light of the target and background features to be observed is provided. A design concept is included showing the possible hardware realization of a candidate system, as well as budgets for the mass, size, power, and pointing requirements of the instrument. Additional design features considered are the influence that short duration missions may have on hardware redundancy and the effect of short, low duty-cycle observation periods on solar array and battery sizing. The way towards a low cost R and D demonstrator system allowing a practical investigation of the key techniques and technologies is addressed. Author (revised)

LOW COST TACSAT FOR NATO SURVEILLANCE **c18**
Charles S. Hoff *In* AGARD, TacSats for Surveillance Verification and C3I Feb. 1993 8 p (For primary document see N93-29892 11-32)
Copyright Avail: CASI HC A02/MF A03

Cost and performance technology breakthroughs in recent years have made possible the near term development and deployment of a low cost TACSAT surveillance system. The potential for both the spacecraft and sensor to be launched on lower cost launch systems is the fundamental basis for reduced system cost. Additionally, the spacecraft and sensor must be amenable to low cost mass production. For all weather, day/night surveillance, an active synthetic aperture radar (SAR) is the ideal instrument, and the ability to mass manufacture thousands of very low cost transmit/receive (T/R) modules was developed at Hughes. Since the size of a SAR increases as the orbital altitude is increased, a final element of the economical basis for a low cost TACSAT is the definition of low earth orbit (LEO) space constellations with high mission utility. Tradeoffs are also provided to compare sparse or zero based peacetime constellations with surge launch capabilities to small peacetime early warning space constellations that can also instantly provide regional combat support on demand. COST EFFECTIVE TacSats FOR MILITARY SUPPORT c18
M. T. Brodsky, M. D. Benz, and J. T. Neer *In* AGARD, TacSats for Surveillance Verification and C3I Feb. 1993 12 p (For primary document see N93-29892 11-32)
Copyright Avail: CASI HC A03/MF A03

The key space system features required to provide effective support to military field units are discussed and Lockheed's concept to fill critical niches in military surveillance and remote sensing is discussed. The military is aware of benefits available from more effective use of space. To provide those benefits, space systems must be dependable, easy to use, flexible, responsive, and affordable. How a programmable, multi-spectral E-O sensor combined with a new small satellite bus and supporting command and control and data processing tools can provide environmental and surveillance support to users in peacetime, crisis, and combat is discussed. Also discussed are how such a system meets essential military utility criteria and an approach for rapid TacSat system development, evaluation, and deployment. Author (revised)

(AD-A263543; NRL/MR/7173-92-7004) Avail: CASI HC A04/MF A01

Software written in PV-WAVE to process data collected aboard the RV Cory Chouest during the Acoustic Reverberation Special Research Program Reconnaissance (ARSRP) Experiment conducted in the summer of 1991 is documented in this memorandum report. Although developed specifically for ARSRP-collected data, the software will work on any data collected aboard the RV Cory Chouest and written to 9-track tape for processing with the Off Line Processor (OLP) software in the 'beam tape' (BTS) format - this includes beamformed and hydrophone pass-through data. Software written by the Scripps Institution of Oceanography to read OLP tapes and output files in Society of Exploration Geophysicists 'Y' (SEGY) format is discussed. ARSRP Signal Processing Software (ASPS) discussed in the report includes reading SEGY format archive tapes into ASCII format, conversion of ASCII data files to unformatted form for compact storage and fast access by PV-WAVE, and beamforming and matched filtering with PV-WAVE programs. A program to create waterfall display plots of hydrophone data, beamformed data, or matched filtered data is included. DTIC

A COMPARISON OF TRANS-EQUATORIAL IONOSPHERE PROPAGATION PREDICTIONS FROM AMBCOM WITH MEASURED DATA M.S. Thesis
John W. McKinstry Mar. 1993 92 p
(AD-A264006) Avail: CASI HC A05/MF A01

This thesis examines radio propagation conditions over trans-equatorial (TE) paths. The study precedes Project PENEX, a field experiment to measure and collect calibrated HF skywave signal strength data for polar, equatorial, and near-vertical incidence propagation paths. PENEX will benchmark the absolute accuracy of the signal-to-noise models in the MEDUSA propagation model now being developed by the Naval Command, Control and Ocean Surveillance Center. Since only minimal information is available about TE paths, a comprehensive review of the published literature on TE experiments was completed, with emphasis on TE paths between magnetic conjugate points. Data from such paths have revealed the presence of unusual propagation i-nodes which are not predicted bv standard propagation programs such as PROPHET, IONCAP, and AMBCOM. The review of the literature revealed that Stanford Research Institute (SRI) published measured data on a TE path between the Pacific islands of Kauai and Rarotonga. A comparison was made between the SRI data and predictions for the same path to assess the usefulness of current prediction programs for TE paths. The SRI AMBCOM program was used for this comparison. As expected, sizeable differences were found between the predicted and measured results, especially during times when unusual propagation modes were present. This suggests that prediction programs should be modified to include the observed TE modes. DTIC

APPLICATIONS OF THREE-DIMENSIONAL MODELING IN ELECTROMAGNETIC EXPLORATION Ph.D. Thesis
Louise Donna Pellerin 1992 183 p
Avail: Univ. Microfilms Order No. DA9308492

Numerical modeling is used in geophysical exploration to understand physical mechanisms of a geophysical method, compare different exploration techniques, and interpret field data. Exploring the physics of a geophysical response enhances the geophysicist's insight, resulting in better survey design and interpretation. Comparing exploration methods numerically can eliminate the use of a technique that cannot resolve the exploration target. Interpreting field data to determine the structure of the earth is the ultimate goal of the exploration geophysicist. Applications of three-dimensional (3-D) electromagnetic (EM) modeling in mining, geothermal and environmental exploration demonstrate the importance of numerical modeling as a geophysical tool. Detection of a confined, conductive target with a vertical electric source (VES) can be an effective technique if properly used. The vertical magnetic field response is due solely to multi-dimensional structures, and current channeling is the dominant mechanism. A VES is deployed in a bore hole, hence the orientation of the hole is critical to the response. A deviation of more than a degree from the vertical can result in a host response that overwhelms the target response. Only the in-phase response at low frequencies can be corrected to a purely vertical response. The geothermal system studied consists of a near-surface clay cap and a deep reservoir. The magnetotelluric (MT), controlled-source audio magnetotelluric (CSAMT), long-offset time-domain electromagnetic (LOTEM) and central-loop transient electromagnetic (TEM) methods are appraised for their ability to detect the reservoir and delineate the cap. The reservoir anomaly is supported by boundary charges and therefore is detectable only with deep sounding electric field measurement MT and LOTEM. The cap is easily delineated with all techniques. For interpretation I developed an approximate 3-D inversion that refines a 1-D interpretation by removing lateral distortions. An iterative inverse procedure invokes EM reciprocity while operating on a localized portion of the survey area thereby greatly reducing the computational requirements. The scheme is illustrated with three synthetic data sets representative of problems in environmental geophysics. Dissert. Abstr.

QUANTIFICATION OF THERMOGRAPHIC MAPPING TECHNIQUES Final Report
John Norgard and Don Metzger Dec. 1992 90 p
(Contract F30602-91-C-0113)
(AD-A264020; RL-TR-92-320) Avail: CASI HC A05/MF A01

Thermographic mapping of microwave fields is a method of imaging the electromagnetic field in a region of space by viewing the heating it produces when interacting with a material. As the microwave field interacts with a material, some of the electromagnetic energy may be converted into heat. This heat can be viewed in several ways; the most useful technique developed to date involves an infrared camera. The objective is to develop appropriate theoretical and experimental practices to allow for the design and manufacture of an electromagnetic absorbing screen. The absorbing screen must exhibit a significant heat rise for a small amount of incident electromagnetic energy while not disturbing the electromagnetic field it is measuring. Thus, the design of the absorber involves a trade-off between these two desirable properties. DTIC

SCATTERING THROUGH APERTURES AND BY THREE-DIMENSIONAL STRUCTURES. APPLICATION TO THE MEASUREMENT OF THE SURFACE IMPEDANCE OF CONDUCTIVE MATERIALS Ph.D. Thesis - Univ. des Sciences et Techniques, 1989 [DIFFRACTION PAR DES OUVERTURES ET PAR DES OBJETS TRIDIMENSIONNELS. APPLICATION A LA MESURE DES IMPEDANCES DE SURFACE DES MATERIAUX BONS CONDUCTEURS]
Vincent Gobin 1990 184 p In FRENCH
(ONERA-P-1990-2; ETN-93-93719) Avail: CASI HC A09/MF A02

The influence of conductive materials (such as carbon composite materials) in the propagation of electromagnetic perturbations into aircraft is studied. The method of moments (in frequency domain) is used to calculate the current distribution on a three dimensional structure of any shape. Two integral equations are constructed to calculate the scattering of a known wave through apertures and the current distribution in an object (characterized by its surface impedance) divided into surfaces and wires. The basis functions for wires and surfaces are generalized to modelize the wire/surface junctions. Various numerical applications are presented. The scattering through a loaded aperture is studied, both experimentally and theoretically and the influence of junctions between materials is emphasized. A method of measurement of surface impedance (from a few micro-Ohms to a few Ohms) is presented. ESA

ELECTRO-OPTIC CHARACTERISATION OF EXTREMELY WIDE BANDWIDTH ELECTRICAL SIGNALS
A. C. Lindsay, G. A. Knight, S. C. Troedson, and I. G. Fuss Feb. 1993 43 p
(AD-A264202; ERL-0673-RR; DODA-AR-008-114) Avail: CASI HC A03/MF A01

In this report an ultrafast electro-optic sampling system suitable for applications such as device characterization is described. The aperture time of the sampler is calculated to be about 290 fs, implying an attainable device bandwidth in excess of 300 GHz. The sampler was characterized using a test pulse with approximately 12 GHz of frequency content, and the results compared to those obtained from an 18 GHz digital sampling oscilloscope. DTIC

THE 1992 WORLD ADMINISTRATIVE RADIO CONFERENCE: TECHNOLOGY AND POLICY IMPLICATIONS
May 1993 199 p Conference held in Malaga-Torremolinos, Spain, Feb. 1992
(OTA-TCT-549; ISBN-0-16-041766-X) Avail: CASI HC A09/MF A03; SOD HC

As the 20th century draws to a close, new radio technologies and services are poised to change the ways we communicate. Radio waves already make possible a wide range of services considered commonplace--AM and FM radio broadcasting, television, cellular telephones, remote garage-door openers, and baby monitors. Advances in radio technology are giving birth to even more new products and services, including pocket-sized telephones that may allow people to make and receive calls anywhere in the world, high-definition televisions (HDTV) with superior quality pictures and sound, and static-free digital radios. The 1992 World Administrative Radio Conference (WARC-92) authorized frequencies for many of these new radio communication services, and granted additional frequencies for many existing services, including international broadcasting, satellite-based mobile communications, and communications in space. The effects of these changes will be felt well into the 21st century as countries around the world develop and deploy new communications systems to serve the needs of consumers, businesses, and governments. For the United States, the decisions made at the conference will critically affect how we develop new radio technologies and applications, how competitive this country will be in radio communications equipment and services, and how effectively the United States can exercise its role as a leader in world radio communication policymaking. This study of the outcomes and implications of WARC-92 was requested by the House Committee on Energy and Commerce and the Senate Committee on Commerce, Science, and Transportation. OTA was asked to evaluate the success of U.S. proposals at the conference, discuss the implications of the decisions made for U.S. technology and policy development, and identify options for improving U.S. participation in future world radio communication conferences. REVIEW OF THE EFFECTIVENESS OF VIDEO MEDIA IN INSTRUCTION Final Report, Jan. 1991 - Sep. 1992
C. D. Wetzel, Paul H. Radtke, Hervey W. Stern, Jan Dickieson, and J. C. McLachlan Apr. 1993 218 p
(AD-A264228; NPRDC-TR-93-4) Avail: CASI HC A10/MF A03

Visual forms of instruction are increasingly used as a result of the widespread use of video technologies such as broadcasts, teleconferencing, tapes, videodiscs, and emerging multimedia combinations of computer and digital video technologies. The considerable amount of research that stretches back to early work with film, television, and static visual materials can be of benefit in developing these new forms of instruction. The objective is to present a review of the current research literature regarding the use of dynamic video media in instruction. Research on the following topics was reviewed: general reviews of the effectiveness, acceptance, and costs of several forms of educational television; teaching techniques used effectively with video media; combining visual and verbal information; the effects of motion, animation, and interactivity, the relationship between media perceptions and learning; the effect of various video production techniques on learning; and critical perspectives on learning from media. This review can be used as background material for future research or instructional development efforts concerned with learning from video-based media. DTIC

CONSULTATIVE COMMITTEE FOR SPACE DATA SYSTEMS RECOMMENDATION FOR SPACE DATA SYSTEM STANDARDS: TELECOMMAND. PART 2.1: COMMAND OPERATION PROCEDURES
Jan. 1991 71 p Prepared in cooperation with CNES, Paris, France, DFVLR, Berlin, Germany, ESA, Paris, France, ISRO, Bangalore, India, INPE, Sao Jose dos Campos, Brazil, and NASDA, Tokyo, Japan
(NASA-TM-108158; Red-Book-Issue-4; CCSDS-202.1-R-4; NAS 1.15:108158) Avail: CASI HC A04/MF A01

This recommendation contains the detailed specification of the logic required to carry out the Command Operations Procedures of the Transfer Layer. The Recommendation for Telecommand--Part 2, Data Routing Service contains the standard data structures and data communication procedures used by the intermediate telecommand system layers (the Transfer and Segmentation Layers). In particular, it contains a brief description of the Command Operations Procedures (COP) within the Transfer Layer. This recommendation contains the detailed definition of the COP's in the form of state tables, along with definitions of the terms used. It is assumed that the reader of this document is familiar with the data structures and terminology of part 2. In case of conflict between the description of the COP's in part 2 and in this recommendation, the definition in this recommendation will take precedence. In particular, this document supersedes section 4.3.3.1 through 4.3.3.4 of part 2. Author

MULTISCALE AND MULTIGRID INFORMATION REPRESENTATION, EXTRACTION AND FUSION Final Report, 1 Feb. 1992 - 31 Jan. 1993
Ahmed Tewfik Apr. 1993 71 p
(Contract F49620-92-J-0134)
(AD-A264623; AFOSR-93-0322TR) Avail: CASI HC A04/MF A01

The basic goal of this research was to study the role that wavelet theory can play in information representation and extraction. The researchers focused their attention primarily on surveillance applications. As part of their research, they studied two problems that arise in surveillance. The first problem was that of determining the directions of arrivals of a set of plane waves in the presence of a background noise of unknown correlation structure. The second problem involved selecting an optimal set of N waveforms, with N fixed, to obtain the best reconstruction of a distributed range-doppler target reflectivity function. DTIC

CHARACTERISTICS OF HIGH-FREQUENCY SIGNALS, NOISE, AVAILABILITY, AND DURATION OF BANDWIDTHS BASED ON ROTHR AMCHITKA SPECTRUM MEASUREMENTS
G. D. McNeal 16 Apr. 1993 43 p
(AD-A264480; NRL/FR/5324-93-9536) Avail: CASI HC A03/MF A01

The successful performance of a High-Frequency (HF) Over-The-Horizon Radar (OTHR) is dependent upon the environment in which the radar must operate. This study investigates measured power levels of noise and signal characteristics in the HF environment of an operational OTHR system located in Amchitka, Alaska. These measurements were acquired by the Navy's AN/TPS-71 Relocatable OTHR (ROTHR) spectrum monitor, and represent a new source of HF environmental measurements for noise characteristics, channel availability, and expected duration of various channel widths as a function of frequency, time-of-day, and season-of-year. The analysis and results presented are based on HF environmental measurements obtained over the 5 to 28 MHz frequency band by a receiver with a very low noise figure, an efficient antenna, a high dynamic range, and which was seldom internally noise limited. The analysis of this data has provided information on power levels associated with noise and HF users in the geographic region of the radar. Clear channel availability results are based on a threshold level defined by empirical distribution functions (EDF) of the measured power levels from the ROTHR site in Amchitka. Discussions are also provided on how the noise power levels measured by the spectrum monitor compare with CCIR predictions for this geographical location. Directional characteristics are inferred by comparing spectrum monitor noise levels with those seen on the radar. DTIC

ADAPTIVE AIRBORNE RADAR SIMULATION WITH EQUALIZATION FILTER TAPS
B. N. Babu and J. A. Torres Apr. 1993 11 p
(AD-A264722; M-93B0000041) Avail: CASI HC A03/MF A01

Space-time processing (STP) provides an adaptive filter for an airborne phased-array radar to detect targets in clutter and jamming that have spatial and Doppler spread. We developed a flexible airborne radar simulation to identify limitations in the techniques and to evaluate the capabilities of different STP designs. One of the space-time architectures, jointly adaptive STP in the element space, employs joint processing of array elements and pulse train data. The array elements provide the azimuth (spatial) information, and the pulse repetition interval (PRI) taps or pulses provide the Doppler information required to form the two-dimensional azimuth-Doppler filter. In the adaptive mode, additional temporal information from taps separated by a sampling rate interval (greater than Nyquist) provide additional degrees of freedom to mitigate interference due to wideband, narrowband, and multipath jamming. This paper discusses the theory and implementation of STD using temporal equalization filter taps, and presents three different examples illustrating the features of the simulation. DTIC

EFFECTS OF IMBALANCES AND DC OFFSETS ON I/Q DEMODULATION
Jim P. Lee Dec. 1992 55 p
(AD-A264466; DREO-1148) Avail: CASI HC A04/MF A01

The effects of imbalances and DC offsets, in an I/Q demodulator, on the demodulation of radar signals are addressed in this report. Three normalized parameters, namely the peak-to-peak-ripple to mean, phase error and normalized instantaneous frequency deviation are used to characterize distortions introduced on the envelope, phase and instantaneous frequency respectively. The effect on the distortions, due to aliasing and approximation use in deriving the instantaneous frequency in a discrete-time processor, is also analyzed. When there are imbalances and DC offsets, a bias is produced on both the demodulated envelope and phase. AC ripples with frequency components which are multiples of the baseband frequency are also generated on all of the three demodulated signal waveforms. In EW applications, the instantaneous bandwidth of the I/Q demodulator is usually much wider than the demodulated signal bandwidth. As a result, when the baseband frequency of the signal is high and comparable to its modulation bandwidth, the higher frequency components of the distortion can be effectively reduced by low-pass filtering. MULTIRESOLUTION ANALYSIS OF SAR DATA Final Report, Sep. 1989 - 1992
Robert Hummel Jan. 1993 19 p
(Contract F33615-89-C-1087)
(AD-A264727; WL-TR-93-1011) Avail: CASI HC A03/MF A01

The 'Multiresolution Analysis of SAR Data' program supported research work in five areas. Geometric hashing theory can now be viewed as a Bayesian approach to object recognition. False alarm rates can be greatly reduced by using certain enhancements and modifications developed under this project. Geometric hashing algorithms now exist for the Connection Machine. Recognition of synthetically-produced dot arrays was demonstrated using a model base of 1024 objects. The work represents a substantial advance over existing model-based vision capabilities. Algorithms were developed for determining the translation and rotation of a sensor given only the image flow field data. These are new algorithms, and are much more stable than existing computer vision algorithms for this task. The algorithms might provide independent verification of gyroscopic data, or might be used to compute relative motion with respect to a moving scene object, or may be useful for motion-based segmentation. Our theories explaining the Dempster/Shafer calculus and developing new uncertainty reasoning calculi were extended, and presented at a conference and were incorporated into the Bayesian interpretation of geometric hashing. 'Wavelet Slice Theorem' was developed in several different versions, any of which yields an alternate approach to image formation. The result may well provide a more stable approach to image formation than the standard Fourier-based projection slide theorem, since interpolation of unknown spectra values is better-founded. DTIC

APPLICATION OF INTEGRAL AND DIFFERENTIAL EQUATION METHODS FOR VARIOUS EM INTERACTION PROBLEMS
Mar. 1993 43 p
(AD-A264821; NRAD-TD-2453) Avail: CASI HC A03/MF A01

This document reviews the application of integral equation methods that are commonly used to study the interaction of EM fields with two-dimensional lossy anisotropic objects. The study focuses on plane wave scattering done by arbitrarily shaped cylindrical geometries that have circular and rectangular cross sections. In addition to discussing solid material objects, the document investigates the bistatic radar cross section of several metallic circular cylinders that are coated with a single layer of anisotropic material. The document concludes by investigating the radiation effects from a uniform line source that runs through a lossy anisotropic shell of finite thickness. The document discusses combined-field surface integral equations (CFSIE's). It presents highlights of the method of moments (MOM) numerical solution to CFSIE's and gives numerical results for solid, hollow, and coated cylindrical scatterers. The effects of material anisotrophy in the EM response of the scatterer are emphasized. DTIC

N93-30611# Federal Aviation Administration, Cambridge, MA.
AN ANALYSIS OF EN ROUTE CONTROLLER-PILOT VOICE COMMUNICATIONS
Kim M. Cardosi Mar. 1993 25 p
(AD-A264784; DOT-VNTSC-FAA-93-2; DOT/FAA/RD-93/11) Avail: CASI HC A03/MF A01

The purpose of this analysis was to examine current pilot-controller communication practices in the en route environment. Forty-eight hours of voice tapes from eight different Air Route Traffic Control Centers (ARTCC's) were examined. There were 5,032 controller-to-pilot transmissions and 3,576 clearances (e.g., instructions to maneuver or change radio frequencies, routing changes, etc.) in this sample. The complexity of the clearance (i.e., the number of pieces of information) was examined and the number of erroneous readbacks and pilot requests for repeats were analyzed as a function of clearance complexity. Pilot acknowledgements were also analyzed; the numbers of full and partial readbacks, and acknowledgements only (i.e., 'roger') were tallied. Fewer than one percent of the clearances resulted in communications errors. Among the error factors examined were the following: complexity of the clearance, type of acknowledgement, use of call sign in the acknowledgement, type of information in error, and whether or not the controller responded to the readback error. Instances in which the controller contacted the aircraft with one call sign and the pilot acknowledged the transmission with another call sign were also examined. The report concludes with recommendations to further reduce the probability of communication problems. DTIC

RADIATION-HARDENED MICROWAVE COMMUNICATIONS SYSTEM
S. F. Smith, D. W. Bible, R. I. Crutcher, J. H. Hannah, J. A. Moore, C. H. Nowlin, R. I. Vandermolen, D. Chagnot (Commissariat a l'Energie Atomique, Grenoble, France.), and A. LeRoy (Commissariat a l'Energie Atomique, Grenoble, France.) 1993 9 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-007915; CONF-930403-21) Avail: CASI HC A02/MF A01

To develop a wireless communication system to meet the stringent requirements for a nuclear hot cell and similar environments, including control of advanced servomanipulators, a microwave signal transmission system development program was established to produce a demonstration prototype for the Consolidated Fuel Reprocessing Program at Oak Ridge National Laboratory (ORNL). Proof-of-principle tests in a partially metal lined enclosure at ORNL successfully demonstrated the feasibility of directed microwave signal transmission techniques for remote systems applications. The potential for much more severe radio-frequency (RF) multipath propagation conditions in fully metal lined cells led to a programmatic decision to conduct additional testing in more typical hot-cell environments at other sites. Again, the test results were excellent. Based on the designs of the earlier systems, an advanced microwave signal transmission system configuration was subsequently developed that, in highly reflective environments, will support both high-performance video channels and high baud-rate digital data links at total gamma dose tolerance levels exceeding 10(exp 7) rads and at elevated ambient temperatures. RECEPTION AT ASCENSION ISLAND, SOUTH ATLANTIC, OF THE TRANSMISSIONS FROM THE HEARD ISLAND FEASIBILITY TEST
D. R. Palmer, T. M. Georges, J. J. Wilson, L. D. Weiner, and J. A. Paisley Feb. 1993 35 p Prepared in cooperation with Computer Sciences Raytheon Co., Patrick AFB, FL
(PB93-176261; NOAA-TM-ERL-AOML-73) Avail: CASI HC A03/MF A01

The objective of the Heard Island Feasibility Test (HIFT) is to ensonify the global ocean with a single source to determine the feasibility of measuring the extent of ocean warming due to the greenhouse effect. The signal-to-noise ratios and the precision of arrival times measured at the listening stations will help determine the feasibility of a long-term effort to monitor average oceanic temperature change. The report describes the observational effort undertaken at ascension and discusses general features of the data set collected there. Emphasis is on the spectral characteristics of the received signals and their temporal characteristics before demodulation. NTIS

Algorithms for combination of speech recognition with integrated disturbance cancellation are developed. Some processes of disturbance insensitive speech recognition systems are described, such as extraction of disturbance insensitive speech parameters, training of the reference data base in perturbed environment and a combination of both systems, which uses the Mel frequency cepstral coefficients and the dynamic programming. Several methods of disturbance reduction are presented, which are characterized as one, two and four channel processes, and are based on spectral substraction, adaptive filtration and adaptive Wiener filtration algorithms. Results of speech recognition system simulation without perturbation reduction algorithm and under noise influence are presented, and strategies for speech recognition systems with integrated one, two, and four channel noise reduction are depicted. This publication reports the papers presented to a specialists' meeting held by the Electromagnetic Wave Propagation Panel at its Fall 1992 meeting. The topics covered on the occasion of that symposium include the following: (1) propagation aspects--numerical modelling, propagation measurements, and propagation in sea water; (2) radio noise and interference--long wave TE/TM noise prediction model, measurements, and ELF generated by auroral electrojet modulation; (3) antenna considerations--antenna fundamentals, scale modelling, measurements of pattern and bandwidth, and tethered aerostat VLF/LF transmitting antennas; (4) System aspects--viability assessment for reliable LW communication links; and (5) future satellite systems--orbiting system for ELF/VLF strategic communications, and tethered satellite systems. For individual titles, see N93-30728 through N93-30755.

An introduction and welcome to the Specialists' Meeting on 'ELF/VLF/LF Radio Propagation and System Aspects' given at the Electromagnetic Wave Propagation Panel Symposium, held at the Quartier Reine Elisabeth, Brussels, Belgium, 28 Sep. - 2 Oct. 1992, is presented. The following topics are discussed: the early history of radio communications, NATO interest in ELF/VLF/LF, propagation mode, effect of the finite conductivity of the ground, and VLF antennas. CASI

A reliable knowledge of radio signal amplitude and phase characteristics is required to design and maintain communications and navigational circuits at VLF and LF. The ability to accurately calculate signal levels as a function of frequency, position, and time is of considerable importance in achieving reliable assessment of communication and navigation coverage. Detailed computer models based on multiple mode waveguide theory were developed. These models were found to produce good comparisons between measurements and calculations of signal variations as a function of propagation distance. However, results can be very sensitive to the ionospheric inputs to these computer models. This paper presents an overview of the computer model and results of empirical modeling of the propagation medium. Author (revised)

In this paper, we have presented a tutorial overview of ELF propagation. We have also compared the Greifingers simple form approximate expressions (which relate ELF propagation constants to realistic ionospheric conductivity profiles) with experimentally derived results for both daytime and nighttime ambient propagation conditions. The inverse problem has also been considered. We have used the experimentally determined values of effective attenuation rate and excitation factor, along with the modified Greifinger equations, to establish representative ionospheric parameters for each propagation path considered. These parameters include the reflection height h(sub o), the inverse scale height Beta (which is equal to 1/Zeta(sub 0)), and the reference height H of the equivalent exponential ionospheric conductivity profile. We have recently analyzed some of the field strength data taken at the U.S. Navy's four land based ELF monitoring sites (New London, CT; Norfolk, VA; Kings Bay, GA; and Pearl City, HI). Both the daytime and nighttime inferred values of excitation factors and daytime attenuation rates are in good agreement with previous 75 Hz band measurements taken over various propagation paths. However, the summertime nighttime attenuation rates are substantially lower (approximately 0.6 dB/Mm compared to approximately 1.0 dB/Mm). Also, the summertime daytime attenuation rates (approximately 1.25 dB/Mm) are lower than measured during other times of the year (approximately 1.50 dB/Mm). Author (revised)

This paper presents a short review of the frequency and angle dependencies of the electric field radiated by an electric dipole E = E(sub 0)cos(omega)t in a magnetoplasma and detailed results of numerical calculations of (E) in the VLF and LF frequency bands 0.02f(sub b) is less than or equal to F is less than or equal to 0.5f(sub b) in the ionosphere and magnetosphere in the altitude region Z = (800 - 6000) km (F is approximately (4 - 500) kHz and f(sub b) is approximately equal to (1.1 to 0.2) MHz is the electron gyro-frequency). The amplitudes of the electric field have large maxima in four regions: close to the direction of the Earth magnetic field line B(sub 0) (it is the so called Axis field E(sub 0); in the Storey E(sub St); Reversed Storey E(sub RevSt); and Resonance E(sub Res) Cones. The maximal values of E(sub 0), E(sub Res), and E(sub Rev ST) are the most pronounced close to the low hybrid frequency, F is approximately F(sub L). The flux of the electric field is concentrated in very narrow regions, with the apexes angles of the cones delta(beta) is approximately (0.1 - 1) degree. The enhancement and focusing of the electric field increases with altitude starting at Z is greater than 800 km. At Z is greater than or equal to 1000 up to 6000 km, the relative value of E, in comparison with its value at Z equals 800 km is about (10(exp 2) to 10(exp 10)) times larger. Thus, the flux of VLF and LF electromagnetic waves in the Earth magnetoplasma produces and is guided by very narrow pencil beams, similar, let us say, to laser beams. Author (revised)

The Research, Development, Test, and Evaluation (RDT&E) division of the Naval Command, Control and Ocean Surveillance Center (NCCOSC), and its predecessors, Navy Electronics Laboratory (NEL), Naval Electronics Laboratory Center (NELC), and Naval Ocean Systems Center (NOSC), have had a continuing program to develop a reliable VLF/LF communications coverage prediction capability for the U.S. Navy. This involves the measurement of field intensity of many communication stations, the development of propagation models to fit the data measured, and the validation of these models to verify predictions for all seasons world-wide, including possible solar cycle effects. During the current campaigns, data were recorded using various platforms including numerous aircraft, six ships, three submarines, and up to 28 fixed sites since 1981. Currently, data are being recorded aboard two ships and at seven fixed sites. An attempt is made to maintain an overall root-mean-square (rms) accuracy of 0.5 dB, with system calibration and stability measured to the order of 0.1 dB ring. The goal for the model under development is to fit these data and extrapolate predictions to other propagation conditions to within 1 dB. This was a challenging task where local environmental effects can cause significantly larger perturbations. A review of the literature is presented summarizing and comparing methods and techniques used by other researchers in the field. This is followed by discussion of the commercial equipment used, the calibration and recording procedures followed, a comparison of results obtained simultaneously using various platforms and sites, and an estimate of the overall accuracy/reliability of the data obtained. VLF PROPAGATION MEASUREMENTS IN THE CANADIAN ARCTIC

Wilfred R. Lauber and Jean M. Bertrand *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 12 p (For primary document see N93-30727 11-32)

For the past three years, during a period of high sun spot numbers, propagation measurements were made on the reception of VLF signals in the Canadian Arctic. Between Aug. and Dec. 1989, the received signal strengths were measured on the Canadian Coast Guard icebreaker, John A. MacDonald in the Eastern Canadian Arctic. Between Jul. 1991 and Jun. 1992, the received signal strengths were measured at Nanisivik, Baffin Island. The purposes of this work were to check the accuracy and estimate variances of the Naval Ocean Systems Center's (NOSC) Long Wave Propagation Capability (LWPC) predictions in the Canadian Arctic and to gather ionospheric storm data. In addition, the NOSC data taken at Fort Smith and our data at Nanisivik were used to test the newly developed Longwave Noise Prediction (LNP) program and the CCIR noise predictions, at 21.4 and 24.0 kHz. The results of the work presented and discussed in this paper show that in general the LWPC predicts accurate values of received signal strength in the Canadian Arctic with standard deviations of 1 to 2 dB over several months. Ionospheric storms can gauge the received signal strengths to decrease some 10 dB for a period of several hours or days. However, the effects of these storms are highly dependent on the propagation path. Finally the new LNP atmospheric noise model predicts lower values of noise in the Arctic than the CCIR model and our limited measurements tend to support these lower values. Author (revised)

THEORETICAL AND EXPERIMENTAL COVERAGE ANALYSIS OF A VLF TRANSMITTER

Detlev Borgmann *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 5 p (For primary document see N93-30727 11-32)

Copyright Avail: CASI HC A01/MF A03

The coverage area of a VLF transmitting station, located in the northern part of Germany, is analyzed. In order to predict the receiving skin depth for the complete operation area of the VLF station, some investigations were made in theoretical propagation models. Then a computer program based on the wave guide mode theory was implemented. To verify the validation of the theoretical model, measurements of field strength in some specific areas were carried out. The first part of the paper is concerned with a description of the theoretical approach of the coverage analysis. The second part describes some properties of the operation area and gives in detail results from measurements. Finally, a comparison of theoretical and measured data then shows the quality of agreement between theory and praxis. Author (revised)

VLF Radiowave propagation provides one of the few viable tools for exploring the properties of the lower D-region ionosphere. Conversely, VLF communications coverage analysis and prediction is directly dependent on the quality of models for the D-region ionosphere. The VLF Omega navigation signals are an excellent and under-utilized resource for conducting D-region research in direct support of VLF communications. Stations are well placed for investigating polar, mid latitude, and equatorial phenomena. Much can be learned by fully utilizing the very stable signals radiated at five frequencies, available from each of the eight transmitters, and taking full advantage of modal structure. While the Omega signals, 10.2 to 13.6 kHz, are well below the VLF communications band, we contend that much of the knowledge gained on D-region characteristics can be directly applied at the higher frequencies. The opportunity offered by Omega needs to be exploited. With the Global Positioning System (GPS) coming onboard as the prime means for global navigation, pressure is mounting to phase out Omega. In this paper we describe how we are using Omega along with computer codes of full wave VLF propagation, provided to us by the U.S. Naval Ocean Systems Center (NOSC), for ionosphere research and by example illustrate the potential for other investigations. This paper describes certain characteristics and statistics of the Trimpi effect, as observed near to and equatorward of the Antarctic Peninsula region, inferred using data from specially designed narrowband OPAL (Omega Phase and Amplitude Logger) receivers deployed in 1989 at Faraday and Halley stations, Antarctica. The amplitude and phase of signals from four Omega VLF transmitters were recorded in each Omega segment (8 segments per 10 s). A 12 month data set was scanned for Trimpi events which, however, were observed on only three of the eight paths, namely Hawaii-Faraday, Argentina-Faraday, and Argentina-Halley, due to inadequate signal-noise ratio on the other paths. The great majority of the approximately 3500 observed events occurred at night. For the all-sea, Hawaii-Faraday path at night, with a single mode dominant at the receiver, lightning-induced electron precipitation (LEP) was inferred to be occurring up to approximately 1.8 Mm from Faraday. A scatter plot of Trimpi amplitude versus phase for this path is interpreted to infer that LEP regions responsible for the events occurred mostly in the L-range 2-3, with the horizontal size of an affected region in the ionosphere being typically 50 km latitudinally and 200 km longitudinally. In recent years, at least two different ways in which energy from lightning discharges couples into the lower ionosphere and the radiation belts have come to the fore. In this paper, we briefly review these recent results especially from the point of view of their effects on VLF/LF radio propagation in the earth-ionosphere wave guide. We separately discuss two different mechanisms of coupling, namely lightning-induced electron precipitation, and lightning-induced heating and ionization of the lower ionosphere. We also discuss a planned active VLF wave-injection experiment designed to investigate ionospheric heating by VLF waves under controlled conditions and to generate ELF waves by modulated VLF heating. STUDIES OF THE PROPAGATION OF LOW FREQUENCY (LF) RADIO WAVES

E. M. Warrington and T. B. Jones *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 20 p Sponsored in part by Defence Research Agency (For primary document see N93-30727 11-32)

Copyright Avail: CASI HC A03/MF A03

Low frequency (30-300 kHz) radio waves can propagate to great distances with little attenuation in the cavity formed by the earth and the ionosphere. Because of the relatively high frequency at LF, many active propagation modes can occur between the transmitter and receiver. Changes in the ionospheric conductivity or reflection height can influence the phase and amplitude of these modes and, hence, produce mutual interference. Because of these interference effects, the propagation is less stable than at VLF and the received field strength becomes more difficult to predict. In the present investigation, the WAVEHOP program was employed in conjunction with a range of ionospheric models to estimate the receiver field strength over a number of experimental paths. The predicted values were compared with those measured in an attempt to validate the ionospheric models and the method of calculation. Author (revised)

ELF PROPAGATION IN DEEP AND SHALLOW SEA WATER
C. P. Burke and D. LlanwynJones *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 8 p Sponsored in part by Defence Research Agency (For primary document see N93-30727 11-32)
Copyright Avail: CASI HC A02/MF A03

In this paper, electromagnetic wave propagation at Extremely Low Frequencies (ELF) in deep and shallow sea water is considered. The term 'ELF' is used here somewhat loosely to refer to the frequency band 0-3 kHz. The radiation source is considered to be located in the sea water and is taken to be a horizontal electric dipole (HED) or a vertical electric dipole (VED). For the deep water ease, a comparison is made between results computed using complex image theory and results calculated using the full Sommerfeld integral formulation. Both of these formulations include the lateral waves which propagate along the air-sea interface. Moving on to the case of shallow water, there are two lateral wave modes of propagation-lateral waves which propagate on the sea surface and along the seabed. These modes are included by numerical evaluation of the Sommerfeld integrals which appear in the complete solution. We also compare the relative efficacy of subsurface horizontal electric dipoles and vertical electric dipoles as radiators. For the case of zero frequency (dc), the Sommerfeld integrals simplify considerably enabling the fields to be evaluated as the sums of infinite series. This dc formulation leads to much reduced computation time. Finally, the effects on propagation of long-wavelength water gravity waves or tides on the surface of the sea are examined by considering these waves as a perturbation to the sea-air interface. COMPARATIVE STUDY OF UNDERSEA FIELDS PRODUCED BY VARIOUS DIPOLES
G. Annaert and A. Barel *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 9 p (For primary document see N93-30727 11-32)
Copyright Avail: CASI HC A02/MF A03

ELF/VLF/LF-radiation by electric or magnetic dipoles located above or on the surface of the earth or sea is investigated from the exact Sommerfeld potentials. Due to the nonzero conductivity of the ground or sea water, the waves are strongly attenuated and only a small near field can be effectively used for communication in a low frequency range. The Fresnel coefficient approximation technique, which presumes a planar plane wave propagation, is correct in the far-field but loses great accuracy in a region close to the radiator. It is the purpose of this paper to review the electromagnetic propagation in layered media based on the rigorous spectral domain method. This theory expresses the Hertz potentials, either of the magnetic type A or the electric type F, in terms of Sommerfeld integrals. A communication range, as the maximum depth at which satisfactory signal reception is still possible, is derived in function of ground parameters, frequency, and dipole orientation. Author (revised)

This paper describes a method of predicting the depth performance of a VLF/LF (Very Low Frequency/Low Frequency) communications system for submarine reception. The method uses a Long Wave Propagation Capability program which includes parameters of the system to be considered, such as transmitter power, aerial, and receiver sensitivities. Results from an analysis for a particular communications system are presented including an audio visual format to show the expected variations in depth performance with reference to operational frequency, transmitter power, time of day and year, and the signal to noise requirements for the system. The analysis method is flexible and could be adapted for similar communications systems. Author (revised)

A computer model that predicts both horizontally and vertically polarized noise in the ELF to LF band (10 Hz-60 kHz) is described. Since naturally occurring radio noise in this band is produced by lightning, and propagates to the receiver via the earth-ionosphere waveguide, the model starts with average lightning flash density data which it turns into radiated power for horizontal and vertical noise. Adjustments are made to the radiated power to account for seasonal and latitudinal differences in the lightning processes. The noise power is then integrated over fairly large geographic areas into horizontal and vertical equivalent noise transmitters. The power radiated from each of these transmitters is propagated to the receiver location using standard anisotropic long wave propagation algorithms and well-known models of the earth-ionosphere waveguide. From the received power, the model predicts RMS noise, standard deviation, voltage deviation VD, and the amplitude probability distribution of the noise for both polarizations. Since the model is based on theory, it can also predict these parameters under disturbed ionospheric conditions. The model's agreement with data is demonstrated. Author (revised)

Within the framework of the TSS1 (Tethered Satellite System)-Project, a measurement program on the electromagnetic background noise was performed. This program, called OESEE (Observation on the Earth Surface of Electromagnetic Emissions), intends to carry out a number of passive detections of possible emissions by the orbiting tethered system. From theoretical considerations on the cold plasma theory in the ionosphere, the expected frequency band of these emissions should be in the order of about 1 Hz up to 60 Hz. In order to design an optimal receiver of such a signal, the noise statistical characteristics have to be taken into account. From the literature, it was shown that this noise is characterized, from the statistical viewpoint, by a non-gaussian and non-stationary behavior. This paper outlines some recently proposed applications of non-gaussian and non-stationary signal processing techniques which can be usefully applied to ELF (Extremely Low Frequency) electromagnetic noise characterization for detection and parameter estimation purposes. Some simulation examples are presented together with some results obtained from experimental data of natural background noise in the ELF range recorded at Canary Islands as a preliminary test of the TSS1 mission. The TSS1 (Tethered Satellite System) is a NASA/ASI (Agenzia Spaziale Italiana) research project. Author (revised)

We report simultaneous measurements of ELF/VLF radio noise (10 Hz-32 kHz) at three high latitude locations (Thule and Sondrestromfjord, Greenland; and Arrival Heights, Antarctica) during a number of moderately large and large solar particle events (SPE's) including some of the largest that have been observed during the last three decades. Thule is close to the center of the northern polar cap and thus the ELF/VLF noise signals reaching it are particularly exposed to the ionospheric effects of the SPE's, whereas the ELF/VLF noise signals at Sondrestromfjord and Arrival Heights, which are located closer to their corresponding auroral zones, should be less affected. These general expectations are supported by the results of our measurements, which show major changes occurring in the Thule noise statistics following the start of the polar cap absorption (PCA) caused by the SPE's and smaller changes at Sondrestromfjord and Arrival Heights. The changes depend markedly on the frequency of the noise signals. At Thule, for frequencies in the approximate range 250 Hz to 1.5 kHz, the diurnal variation in the ring noise amplitudes is typically suppressed during the 2-3 days following the start of the PCA, and in most of the examples we have examined there tends to be a decrease in the average amplitude. Nevertheless, increases can occur. Following the event of 12 Aug. 1989, the noise amplitudes increased by as much as 10-15 dB. For most other frequencies in the range 10 Hz-32 kHz there is little change in the noise statistics. However, in the range 3-10 kHz there tends to be a marked decline in the ring noise amplitudes at Thule in the 24 hours following the start of the PCA, after which there is a rapid recovery to the undisturbed levels. At Sondrestromfjord and, to a lesser extent, at Arrival Heights, the most marked change appears to be the suppression of the diurnal variation noise peaks and thus lower average noise amplitudes in the 2-3 days following the start of the PCA. A 16-bit digital spectrum analysis system was designed and built to provide measurement capabilities not currently available in commercial systems. The system provides the wide dynamic range necessary to observe very weak signals in the presence of strong signals. Large sample size allows for high frequency resolution. System outputs include spectral densities, amplitude probability distributions, diurnal amplitude variations, and time domain plots. Measurements were made to characterize the ELF/VLF H-field noise environment in a sampling of office buildings. These include two buildings in New York City and two Denver office buildings. Measurements were made for all hours of the day and include business day and weekend coverage. Results reveal a complicated signal environment. Associated with the power distribution frequencies were strong odd harmonics with higher harmonics evident into the kilo Hertz range; other man-made noise components were also evident. Author

This paper reports the results of the first concerted effort (both experimentally and theoretically) to characterize the various parameters of the Extremely Low Frequency (ELF) and HIgh Power Auroral Stimulation (HIPAS) polar electrojet antenna excited by the HIPAS radiating facility. These parameters include the magnetic dipole moment, excitation height, and range and bearing dependence. The experimentally determined values of these various parameters, using a mobile ELF receiver, as well as a long distance station, are in agreement with predictions. Author (revised)

VLF/LF TRANSMITTING ANTENNAS
John S. Belrose *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 22 p Sponsored in part by Dept. of National Defence (For primary document see N93-30727 11-32)
Copyright Avail: CASI HC A03/MF A03

Very Low Frequency (VLF) transmitting antenna design is a specialized field of engineering that requires the combined skill of radio, civil, and mechanical engineers. The antenna systems used for this band (15-30 kHz) are enormous structures. Vertical radiators with very extensive top-loading (non-radiating top-hats) are necessary because the electrical height of practical towers is small. For tower heights of 300-450 meters (1000-1500 feet) the electrical heights are only fifteen to forty-five one thousandths of a wavelength. This presentation discusses the following topics: antenna design concepts, antenna fundamentals, tools for antenna modeling, a mini-study of conventional antennas, multiple tuned antenna systems, and a comparison between performance (measured and predicted) for multiple tuned antennas vs. single tuned antennas. This paper presents a method for performing dynamic measurements of antenna bandwidth and phase linearity parameters for VLF transmitter systems. These measurements were undertaken in support of both National and NATO VLF MSK upgrade programs and relate to VLF transmitting antenna characteristics required in order to comply with STANAG 5030. STUDY OF A VLF DISTRIBUTED ANTENNA ARRAY
G. A. Ashdown *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 13 p Sponsored in part by Ministry of Defence (For primary document see N93-30727 11-32)
Copyright Avail: CASI HC A03/MF A03

This study considers the use of an array of VLF antennas distributed throughout the UK, instead of a single, high powered antenna, for submarine command broadcasts. Such an array offers survivability and environmental advantages. The coverage of the array would, however, not be omni-azimuthal, but would have nulls every few degrees as a result of the interference between the signals from the individual antennas. The study investigates the effect on the array coverage of a number of impairments (operating frequency, phase and frequency errors, and antenna loss) and discusses the advantages and disadvantages of steering the main beam to the receiving platform. Consideration is also given to how the received signal will be distorted depending on the location of the receiving platform. It was concluded that a VLF array would not be suitable for providing wide area continuous and assured communications. Author (revised)

APPLICATION OF THE FOURIER TRANSFORM TO SHORT ANTENNAS
Francisco C. V. Grilo *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 7 p (For primary document see N93-30727 11-32)
Copyright Avail: CASI HC A02/MF A03

As is well known, the far field pattern of an aperture is related to a distribution of radiating sources by the Fourier Transform. In this paper, we show that it is also possible to use a Fourier Transform to perform the analysis and synthesis of short antennas. In this way, we can easily have both the analytical and graphical representation of the antenna pattern and the errors that we make with the usual approximating models. It is also possible to make use of know how from the field of signal processing to perform the analysis and synthesis of the radiation pattern. All the theory is based on the Theorem of the Small Complex Translation meaning that we can represent all the current distribution on the antenna by complex translations of an infinitesimal element of current. The correspondent pattern can be found using an adequate spatial variable representation. Author (revised)

This paper presents a numerical procedure which can be effectively used for the analysis/design of a very-low frequency capacitive antenna system on complex platforms and for charge distribution computation. The 'quasi static' radiation problem was solved by means of the corresponding electrostatic solution, by using a Method Of Moments (MOM) procedure.

Pulse basis functions, defined on surface patch domains, and the point-matching test procedure are used in conjunction with a powerful postprocessing numerical tool. Given the platform model, the postprocessing tool allows us to analyze all possible antenna configurations by running the MOM computer code only once. The following parameters can be evaluated: (1) antenna radiation pattern; (2) antenna Norton equivalent circuit, from which the effective voltage at the input of the receiver can be evaluated; (3) induced charge distribution; and (4) scattered electric field distribution near the platform. The proposed solution is particularly useful for applications where the criticality of the structure requires a peculiar attention in defining structural elements that constitute the 'electrical doublet' (conformal antenna). PATTERN MEASUREMENTS OF US NAVY ELF ANTENNAS

E. A. Wolkoff and W. A. Kraimer *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 10 p (For primary document see N93-30727 11-32)

Copyright Avail: CASI HC A02/MF A03

The radiation pattern of an Extremely Low Frequency (ELF) transmitting antenna can be determined from field components measured at a single point. Horizontal magnetic fields from the four US Navy ELF antennas in the north central United States were measured at three receiving locations. The three resulting pattern factors for each antenna are compared and shown to be in good agreement. Author (revised)

TETHERED AEROSTAT VLF/LF TRANSMITTER SYSTEM DESIGN CONSIDERATIONS

Richard L. Crawford, Thomas C. LaManna, and Kenneth L. Jordon (Science Applications International Corp., Vienna, VA.) *In* AGARD, ELF/VLF/LF Radio Propagation and Systems Aspects May 1993 6 p (For primary document see N93-30727 11-32)

Copyright Avail: CASI HC A02/MF A03

A tethered aerostat VLF/LF transmitter (TAVT) system is a cost-effective, survivable alternative for reconstituting VLF/LF communications connectivity to strategic forces in a post-attack environment. This paper describes the tradeoff design considerations that led to recommending a TAVT system with a 50,000-cubic-foot aerostat and a 5,000-foot tether used as the transmitting radio antenna. The major tradeoff factors considered in choosing this design were: survivability, transportability, coverage area, operating frequency range, maximum effective radiated power, cost, and corona avoidance. An orbital emplacement for the transmitter and the antenna of a communications link at ELF (30 to 300 Hz) and VLF (3 kHz to 30 kHz) to submerged submarines has been considered since the very inception of the space age. However, only recently has space technology reached a sufficient level of maturity for system designers to undertake serious studies of this link configuration. The optimistic outlook stems from recent space technology developments, such as the design and construction by NASA of long orbiting tethers, and the testing, onboard Shuttle Orbiter ATLANTIS, of the first spaceborne 20 km metal wire. This is known as the Tethered Satellite System-1 (TSS-1), a space mission that might be possibly followed by other flights, with tether lengths that could reach 100 km. Once deployed at a height of, say, 300 km, from a Shuttle Orbiter, or from another suitable platform, a long, thin tether aligns itself along the local vertical by virtue of the gradient of the Earth gravity field. If made of metal, the tether can function as a VED (Vertical Electric Dipole) transmitting antenna at ELF and VLF. Author (revised)

PERFORMANCE STATISTICS BULLETIN. HIGH LATITUDE METEOR SCATTER PROPAGATION, MAY, JUNE, JULY 1989 Interim Report

Alan D. Bailey, Jens C. Ostergaard, Regina M. Burton, Carlton H. Curtis, and Wayne I. Klemetti 25 Aug. 1992 211 p

(AF Proj. 4643)

(AD-A264003; PL-TR-92-2222; ERP-1107) Avail: CASI HC A10/MF A03

A representative sampling of meteor scatter propagation performance statistics is presented from the PL/GP High Latitude Meteor Scatter Test Bed (HLMSTB). The data address questions of meteor scatter propagation under disturbed ionospheric conditions, as well as normal meteor scatter propagation in the polar region. The time and frequency variations of the propagation transfer function are characterized over the 35 to 147 MHz range, including the availability of useful meteor trails, the potential communication capacity associated with those trails, the occurrence and persistence of ionospheric scatter and sporadic E-layers, variations in the signal-to-noise ratios of each scatter return, and the effects of auroral and polar cap absorption (PCA) events on meteor scatter propagation and communications. Statistics presented include: Arrival Rate, Duration Duty Cycle and Noise Temperature as functions of Day, Time of Day, Signal Threshold, and SNR Threshold. This bulletin is one of a periodic series of polar meteor scatter data bulletins. DTIC

MODIFICATION OF THE S-BAND PHASE SHIFTER MODEL 331A-3 OF ELECTROMAGNETIC SCIENCES INC. [MODIFICATIE VAN DE S-BAND FASEDRAAIER MODEL 331A-3 VAN ELECTROMAGNETIC SCIENCES INC.]

J. D. Schipper 1992 16 p In DUTCH

(DIGEL-1992-5; ETN-93-93308) Avail: CASI HC A03/MF A01

A phase shifter consisting of a variable delay line was modified. The range of this delay line is about 500 ps, which is more than sufficient to shift the phase 360 deg at a frequency of 2.861 GHz. The phase shifter is a piece of waveguide with an N-connector adaptor at each end. A ferrite core in the waveguide was subject to a magnetic field for a short time, causing remanescent magnetism in the core. This magnetism determines the electrical length of the waveguide. ESA

We addressed the problem of detecting targets using an array of active sensors. We have been concerned with devising means of obtaining reliable detection with a small number of samples (small relative to the number of unknown parameters). This problem arises with large arrays, and/or low cross section targets. Past techniques for addressing this problem incorporated prior structure into likelihood procedures. Such approaches are as follows: (1) intractable, requiring iterative solution, (2) not CFAR, and (3) not optimal. We have approached this problem using group symmetries. Specifically, we introduce a framework for exploring array detection problems in a reduced dimensional space by exploiting the theory of invariance in hypothesis testing. This involves calculating a low dimensional basis set of functions called the maximal invariant, the statistics of which are often tractable to obtain, thereby making analysis feasible and facilitating the search for tests with some optimality property. Using this approach, we obtain a locally most powerful test for the unstructured covariance case and show that the Kelly and AMF detectors form an algebraic span for any invariant detector. Applying the same framework to structured covariance matrices, we gain some insights and propose several new detectors which are shown to outperform existing detectors. DTIC

MICROWAVE EMISSION FROM RELATIVISTIC ELECTRON BEAMS Final Report, 1 Nov. 1988 - 31 Oct. 1989
George Bekefi 16 Apr. 1993 188 p
(Grant AF-AFOSR-0082-89)
(AD-A264102; AFOSR-93-0309TR) Avail: CASI HC A09/MF A02

This is a continuation proposal on Microwave Emission from Relativistic electron Beams. Below we summarize the various research activities. All of the experimental studies described below will be performed using our Physics International 615MR Pulserad Accelerator with a maximum voltage of 500 kV and peak currents of 4 kA and the 1.5MV, 30kA Pulserad 110A. The electron beam is presently generated by a thermionically emitting, electrostatically focused, Pierce-type electron gun (250 kV, 250 A) removed from a SLAC klystron. An assembly of six focusing coils is designed so that their magnetic field lines lie along the zero-magnetic field electron trajectories. This field configuration gives the least scalloping of the electron beam (low transverse temperature) and allows the magnetic field amplitude to be varied over a wide range without greatly affecting the electron beam temperature. Only the inner portion of the beam is used; an aperture limits the beam radius to r(sub b) = 0.254 cm. Consequently, the net current available for the different experiments is in the range of 1-8 A. In addition to the above gun, we have recently procured from SLAC a brand-new, state of the art, electron gun that can operate at 450 kV and a peak current of approximately 500 A. The advantage of this system over the previous one is our ability to operate at higher voltages and thus study the various coherent radiation mechanisms at considerably shorter wavelengths. DTIC

SOME PROBLEMS OF RELATIVISTIC ELECTRODYNAMICS
V. N. Streltsov 1991 14 p
(DE92-644738; JINR-E-2-91-184) Avail: CASI HC A03/MF A01 (US Sales Only)

Some problems of electrodynamics are considered from the point of view of the radar formulation of relativity theory. This formulation is based on light or retarded distances, the increasing of longitudinal sizes of moving objects is its consequence. Based of Lienard-Wiechert potentials, it is shown that in terms of retarded distances equipotential surfaces take the form of rotation ellipsoids, stretched in the direction of electric charge motion. The difficulty connected with the appearance of charge in a moving (neutral) current-carrying conductor is overcome. DOE

OPTIMUM DESIGN OF MULTIWIRE CAGES FOR HIGH-VOLTAGE APPLICATIONS
P. M. Hansen Aug. 1992 73 p
(AD-A264310; NRAD-TR-1495) Avail: CASI HC A04/MF A01

This report examines the parameters for systems of multiwire cages carrying high voltages above ground in order to minimize the maximum electric field on the surface of the wires. For the two-wire case, the following methods of calculation were compared (1) a simple geometric theory (SGT); (2) a complete geometric theory (CGT); (3) an infinite series of images (exact solution for given constraints); and (4) a computer-based method of moments (MOM) solution. The MOM results were calculated for cages with 2 through 6 wires, and for 12 wires. This work resulted in two design procedures: one based on minimum wire spacing for a given wire diameter, and the other based on minimizing the total wire cross section of the cage. These procedures are presented along with three examples that include antenna and transmission line applications. DTIC

The Advanced Helicopter Electromagnetics (AHE) Industrial Associates Program has continuously progressed with its research effort focused on subjects identified and recommended by the Advisory Task Force of the program. The research activities in this reporting period have been steered toward practical helicopter electromagnetic problems, such as HF antenna problems and antenna efficiencies, recommended by the AHE members at the annual conference held at Arizona State University on 28-29 Oct. 1992 and the last biannual meeting held at the Boeing Helicopter on 19-20 May 1993. The main topics addressed include the following: Composite Materials and Antenna Technology. The research work on each topic is closely tied with the AHE Consortium members' interests. Significant progress in each subject is reported. Special attention in the area of Composite Materials has been given to the following: modeling of material discontinuity and their effects on towel-bar antenna patterns; guidelines for composite material modeling by using the Green's function approach in the NEC code; measurements of towel-bar antennas grounded with a partially material-coated plate; development of 3-D volume mesh generator for modeling thick and volumetric dielectrics by using FD-TD method; FDTD modeling of horn antennas with composite E-plane walls; and antenna efficiency analysis for a horn antenna loaded with composite dielectric materials. FIELD-EMITTER ARRAYS FOR RF VACUUM MICROELECTRONICS Quarterly Report No. 5, 1 Oct. - 31 Dec. 1992
C. A. Spindt, A. Rosengreen, and P. R. Schwoebel Mar. 1993 36 p
(Contract MDA972-91-C-0029; ARPA Order 8162)
(AD-A262677; SRI-2743) Avail: CASI HC A03/MF A01

SRI International has completed the fifth quarter of a program to develop field-emitter arrays for vacuum microelectronics. The goals of the effort are 5 mA at 5 A/sq cm for at least 2 hours, and demonstrated modulation of the emission at 1 GHz. Low-capacitance cathodes were fabricated that produced 10 mA emission with an applied voltage of 130V, using a chemical vapor deposition process to produce SiO2 layers. One year of continuous 1000-tip cathode operation was achieved for a low-frequency emission test, significantly exceeding the program current density goal. Fabrication and assembly were completed for an apparatus required for microwave testing. In the program to optimize performance of field-emitter arrays, a series of plasma-cleaning experiments, involving hydrogen glow discharge, was performed. DTIC

ORNL SUPERCONDUCTING TECHNOLOGY PROGRAM FOR ELECTRIC ENERGY SYSTEMS
R. A. Hawsey, comp. Feb. 1993 77 p
(Contract DE-AC05-84OR-21400)
(DE93-009588; ORNL/HTSPC-4) Avail: CASI HC A05/MF A01

The Oak Ridge National Laboratory (ORNL) Superconducting Technology Program is conducted as part of a national effort by the US Department of Energy's (DOE's) Office of Conservation and Renewable Energy to develop the technology base needed by US industry for commercial development of electric power applications of high-temperature superconductivity. The two major elements of this program are wire development and systems development. This document describes the major research and development activities for this program together with related accomplishments. The technical progress reported was summarized from information prepared for the FY-92 Peer Review of Projects, which was conducted by DOE's Office of Program Analysis, Office of Energy Research. This ORNL program is highly leveraged by the staff and other resources of US industry and universities. Interlaboratory teams are also in place on a number of industry-driven projects. Patent disclosures, working group meetings, staff exchanges, and joint publications and presentations ensure that there is technology transfer to US industry. Working together, the collaborative teams are making tremendous progress in solving the scientific and technical issues necessary for the commercialization of long lengths of practical high-temperature superconductor wire and wire products. DESIGN AND CONSTRUCTION OF A PROTOTYPE ACTS PROPAGATION TERMINAL Final Report, period ending 26 Apr. 1993
Warren Stutzman, Tim Pratt, Charles Nunnally, Randall Nealy, Will Remaklus, Bill Sylvester, Andrew Predoehl, and Doug Gaff 26 Apr. 1993 21 p
(Grant NAGw-2335)
(NASA-CR-193071; NAS 1.26:193071; SATCOM-93-5) Avail: CASI HC A03/MF A01

The launch schedule for the Advanced Communication Technology Satellite (ACTS) spacecraft did not leave sufficient time for completion of the prototype ACTS Propagation Terminals (APT) prior to initiation of the APT production phase. In fact, the approach used was to construct and test all subassemblies of the terminal with special emphasis on the technically challenging portions. These include the RF front end that uses a state-of-the-art down converter which integrates a low noise amplifier, mixer, post amplifier, filter, and local oscillator port frequency doubler into a single small package. In addition, a new digital receiver that uses the latest DSP technology was developed. Both of these subassemblies were thoroughly tested. The highest risk technology in the APT program was the digital receiver. Several candidate algorithms and DSP chips were investigated early on, primarily under JPL sponsorship. A receiver was constructed based on Texas Instruments chip. The final prototype digital receiver was one based on an Analog Devices chip. The design and test results are documented in a report prepared for this grant. A Primary Design Review (PDR) was conducted 30 May 1991, and a Critical Design Review was held 7 Jul. 1992. Final complete documentation of the APT's will appear in the form of three reports: a hardware description report, a report on the data collection code (ACTS VIEW), and a report on the preprocessing code. NEUTRON RADIATION INDUCED DEGRADATION OF DIODE CHARACTERISTICS
S. M. Khanna, G. T. Pepper, and R. E. Stone Dec. 1992 40 p
(AD-A263277; DREO-1155) Avail: CASI HC A03/MF A01

Neutron radiation effects on diode current-voltage characteristics have been studied for a variety of diode over 1(10)(exp 13) - 3(10)(exp 15) n/sq cm 1 MeV equivalent neutron fluence range. A classification scheme consisting of three types of neutron effects on diode forward characteristics is proposed here for the first time. For constant forward current I(sub F) higher than that in the generation-recombination regime, the diode voltage V(sub F) either increases with fluence phi (Type 1 diode), on V(sub F) first decreases with phi at lower fluence levels and then increases with phi at higher fluence levels (Type 2 diode), or V(sub F) decreases with phi at all fluence levels used in this work (Type 3 diode). Most of the previous results on p-n junction diodes correspond to Type 1 diode results. Type 2 diode results are rather rare in the literature. Several examples of Type 2 diode results are presented here. Type 3 diode results are reported here for other types of diodes not reported earlier. These results are explained qualitatively in terms of the theories for a p-n junction and for radiation effects on semiconductors. It is shown here that a type 3 diode could be developed as a high neutron fluence monitor with three orders of magnitude higher upper limit than the Harshaw p-i-n diode neutron fluence monitor under evaluation at the US Army Aberdeen Proving Grounds, Aberdeen, Md. The results also suggest a methodology for radiation hard diode development. DTIC

IN SITU CHARACTERIZATION OF INTERFACIAL AND BULK PROPERTIES OF LITHIUM POLYMER BATTERIES USING 4-PROBE DC TECHNIQUES
Meilin Liu (Georgia Inst. of Tech., Atlanta.), S. J. Visco, and L. C. DeJonghe Nov. 1992 11 p Presented at the 16th Material Research Society International Symposium on the Scientific Basis for Nuclear Waste Management Fall Meeting, Boston, MA, 30 Nov. - 5 Dec. 1992
(Contract DE-AC03-76SF-00098)
(DE93-007699; LBL-33367; CONF-921101-90) Avail: CASI HC A03/MF A01

The use of transient and steady-state 4-probe techniques for the evaluation of the limitations to performance in solid-state electrochemical devices is described. The application of sequential, bipolar square-wave current pulses to a solid polymer cell with two internal reference electrodes allows separation of the polarization behavior of the various components of the cell, and indicates the rate limiting processes in the cell. Careful design of the experimental cell and appropriate selection of current pulse width allows evaluation of fundamental kinetic and transport properties, as well as activation parameters. Steady state constant-current measurements using 4-probe cells allows in situ observation of interface stability and/or polarization as a function of time as the cell is cycling. DOE

IMPROVING THE JITTER OF THE 150 kJ EXPERIMENTS SOLID DIELECTRIC SWITCHES
E. E. Domning Jan. 1993 189 p
(Contract W-7405-eng-48)
(DE93-009459; UCRL-ID-112497) Avail: CASI HC A09/MF A02

The 150 kJ experiment has four capacitor modules that are individually switched into a central transmission line. Each switch must carry a peak current of 2 MA, have an inductance of under 5 nH, a resistance of under 1 mil, a jitter of 25 nS and be able to hold off 60 kV. We determined that a metal to metal contact solid dielectric switch (SDS) that uses the force from an exploding bridge foil (EBF) to rupture the dielectric would meet these specifications given that we were able to improve its jitter performance. The jitter reported by other experimenters on EBF triggers is in the 100 nS range. To develop a low jitter trigger we designed and tested triggers on an experimental test stand built to simulate a 150 kJ capacitor module. On this test stand we developed an EBF trigger with jitter under 25 nS and a new type of trigger we called the magnetic push trigger also with jitter under 25 nS. The magnetic push trigger uses the magnetic expansion of a stripline due to the Lorentz force to rupture the dielectric. We found that our magnetic push trigger did less damage to switch components and was easier to apply than EBF trigger. DOE

DEVELOPMENT OF Si(1-x)Ge(x) TECHNOLOGY FOR MICROWAVE SENSING APPLICATIONS
Rafael A. Mena, Susan R. Taub, Samuel A. Alterovitz, Paul E. Young (Toledo Univ., OH.), Rainee N. Simons (Sverdrup Technology, Inc., Brook Park, OH.), and David Rosenfeld May 1993 13 p
(RTOP 505-44-2C)
(NASA-TM-106157; E-7843; NAS 1.15:106157) Avail: CASI HC A03/MF A01

The progress for the first year of the work done under the Director's Discretionary Fund (DDF) research project entitled, 'Development of Si(1-x)Ge(x) Technology for Microwave Sensing Applications.' This project includes basic material characterization studies of silicon-germanium (SiGe), device processing on both silicon (Si) and SiGe substrates, and microwave characterization of transmission lines on silicon substrates. The material characterization studies consisted of ellipsometric and magneto-transport measurements and theoretical calculations of the SiGe band-structure. The device fabrication efforts consisted of establishing SiGe device processing capabilities in the Lewis cleanroom. The characterization of microwave transmission lines included studying the losses of various coplanar transmission lines and the development of transitions on silicon. Each part of the project is discussed individually and the findings for each part are presented. Future directions are also discussed. Author (revised)

In this paper, thermal analysis of a three dimensional quarter model of a 156 pad flip-chip on a liquid cooled multichip module with 75 other chips is simulated using COSMOS -- finite element software. Both flip-chip (pad grid array type) and TAB type of interconnections are used for the module. The total power on the board is 67 watts, the flip-chips generating up to 1.5 watts each, and the one TAB type generating 12 watts. Each chip can be modeled independently due to the absence of cross-heating by its neighbors. Forced convection liquid cooling using an organic coolant with various flow rates and thus various convection coefficients are used for the study. The temperature rise in the boundary layer of the coolant was 8 F at the coolant flow rate of 0.08 gallons per minute for the flip-chip with 1.5 watts. The maximum thermal strains calculated were found to be 0.35% (if the temperature of zero strain is assumed to be 0 F, and Young's modulus of solder is 2 Mpsi). The maximum shears were found in the corner bump, and they differed from the next bump by 20%. Polyimide layers above and below the solder bumps were found to contribute about 80% of the thermal resistance! These results are used in a Coffin-Manson analysis to predict adequate life (cycles) for the high lead solder bumps (95%Pb-5%Sn). DOE

DEVELOPMENT OF NICKEL/METAL HYDRIDE SECONDARY BATTERY
T. Ikeya, K. Kumai, and T. Iwahori Jun. 1992 31 p
(DE93-781330; CRIE-T-91084) Avail: CASI HC A03/MF A01

The paper studies reformation of hydrogen storage alloys for improvement of the performance of nickel/metal hydride batteries using hydrogen storage alloys. A method in which cobalt-added alloys are mixed and ground is considered as a substitute for plating based methods. The nickel/metal hydride battery is assembled by controlling the nickel electrode using the reformed alloys produced by this method. The battery shows a life of about 1000 cycles. After reforming the hydrogen storage alloys by nickel-plating, the cycle life is prolonged to over 2000 cycles. It is clear that the hydrogen storage alloys can be reformed by appropriate mechanical treatment by such an easy method as grinding. Additionally, long-time grinding decreases discharge capacity. RESEARCH AND DEVELOPMENT OF CARBON BLACK ANODES FOR LITHIUM SECONDARY CELLS
K. Takei, K. Kumai, T. Iwahori, T. Uwai, and M. Furusho May 1992 34 p
(DE93-781331; CRIE-T-91054) Avail: CASI HC A03/MF A01

Experimental studies are made on basic anode characteristics of carbon black as a substituting material for metal lithium for lithium secondary batteries. Carbon black is employed because of its controllable crystallinity as carbon material to study changes of states under treatment conditions after synthesis, reversibility of charge/discharge, and the amount of side reaction. As a result, carbon black is found out to be applicable to the lithium secondary battery, with further improvement required, though. As for heat treatment after synthesis of carbon black, it is clarified that low temperature treatment (1200 C) is more effective for increase in reversible anode capacity. This is considered to be caused by changes in microstructure of the carbon black associated with the heat treatment. Charge/discharge electric potential is closed to that of metal lithium, and electromotive force reduces only by about 0.2V when assembled as battery. The side reaction occurs only at the initial reaction (charge) time, but the gas generation reaction which increases internal pressure of the battery is approximately 1% of all the reaction. Moreover, in charge/discharge in and after the second cycle, no gas generation reaction is observed, which shows that carbon black is applicable to the lithium battery which is a closed system. DOE

(DE93-010715; LA-UR-93-823; CONF-930292-1) Avail: CASI HC A02/MF A01

Radio-frequency generators, operating at 201 MHz, power the first four stages of the Los Alamos Meson Physics Facility (LAMPF) accelerator. Each generator consists of four stages of series-connected, vacuum-tube amplifiers. The first amplifier is a grid-modulated tetrode that produces 500 W peak-power. The second amplifier is a drive-modulated tetrode that produces 5 kW peak-power. The third stage is a grid- and plate-modulated tetrode that produces 130 kW peak-power. The last stage is a plate-modulated triode that produces 2.5 MW peak power. A modernization program has been initiated to improve the reliability of each of these stages. The first two stages of each generator are being replaced with a single, drive-modulated, solid-state amplifier. Specifications for the amplifier design, and requirements for integration into the system are presented. The third stage will be converted to a drive-modulated system using the current tetrode. This modification involves the development of a 17-kV, 15-A switching supply to replace the present plate-modulator. Design requirements for this switching supply are presented. The final stage will remain plate-modulated but will contain a new driver unit for the modulator tube. DOE

(AD-A263161) Avail: CASI HC A03/MF A01

Work is in progress to determine the dynamic range of superconducting filters by studying their noise and power handling characteristics. The goal is to establish their usefulness in receiver front-end applications. The thermal noise figure of HTS filters and its effect on a filter-low-noise-amplifier chain are being examined. Calculations of the noise figures for the filter alone and for the filter-amplifier chain are shown as a function of filter loss. Notice that, for cooled passive devices, the noise figure is lower than the insertion loss. DTIC

APPROACH TO EXTENDING THE CYCLE LIFE OF LITHIUM SECONDARY BATTERY
K. Kumai, T. Ikeya, K. Ishihara, and T. Iwahori May 1992 24 p
(DE93-776266; CRIE-T-91052) Avail: CASI HC A03/MF A01

With an objective to elucidate life extending requirement in lithium secondary battery, discussions were given on effects of operating conditions on cycle life and integrated capacity using commercially available Li/MoS2 cells. The following matters were made clear. A trend was observed that the battery life extends when discharge depths are held shallow, but the integrated capacity remains constant in low discharge conditions (0.1 C to 0.125 C) regardless of discharge depths, and the total charge amount required for batteries discharged to various depths remained the same: the integrated discharge capacity at high-rate discharge (0.3 C) increased largely (about seven times) over the case of low-rate discharge to the same depth; and the cycle life of a lithium battery is affected not only by discharge depths, but also by charge/discharge currents and charge/discharge voltages, wherein the targeted cycle life for this cell (2,500 cycles or more) was achieved when the cell was charged and discharged at 1.5 V to 2.0 V with the discharge depth held low (30%

D.O.D.) at a low-rate discharge (0.1 C) and high-rate discharge (0.3 C). DOE

STUDY ON DECREASING TORQUE NOISE RESULTING FROM FEEDBACK NOISE FOR THE MODIFIED BANG-BANG CONTROLLER Final Report
Ronald L. Racicot Mar. 1993 18 p
(AD-A263178; ARCCB-TR-93008) Avail: CASI HC A03/MF A01

The main problem with using the modified bang-bang controller is the moderate amounts of feedback noise can lead to high levels of torque noise. This stems from a velocity squared term in the controller. This report presents computer simulation results from a study aimed at decreasing torque noise. Two approaches are (1) decrease feedback noise directly, and (2) modify the controller so that it is less sensitive to feedback noise. We recommend that the control designer decrease feedback noise as much as practical and then decrease controller gains as a function of velocity until acceptable levels of torque noise are achieved. DTIC

Advanced battery technology evaluations are performed under simulated electric-vehicle operating conditions at the Analysis & Diagnostic Laboratory (ADL) of Argonne National Laboratory. The ADL results provide insight into those factors that limit battery performance and life. The ADL facilities include a test laboratory to conduct battery experimental evaluations under simulated application conditions and a post-test analysis laboratory to determine, in a protected atmosphere if needed, component compositional changes and failure mechanisms. This paper summarizes the performance characterizations and life evaluations conducted during FY-92 on both single cells and multi-cell modules that encompass six battery technologies (Na/S, Li/FeS, Ni/Metal-Hydride, Ni/Zn, Ni/Cd, Ni/Fe). These evaluations were performed for the Department of Energy, Office of Transportation Technologies, Electric and Hybrid Propulsion Division, and the Electric Power Research Institute. The ADL provides a common basis for battery performance characterization and life evaluations with unbiased application of tests and analyses. The results help identify the most promising R&D approaches for overcoming battery limitations, and provide battery users, developers, and program managers with a measure of the progress being made in battery R&D programs, a comparison of battery technologies, and basic data for modeling. BIFURCATIONS PHENOMENA IN A NONLINEAR OSCILLATOR: APPROXIMATE ANALYTICAL STUDIES VERSUS COMPUTER SIMULATION RESULTS
Wanda Szemplinska-Stupnicka and Jerzy Rudowski 1992 41 p
Avail: Issuing Activity

The behavior of a driven single-well oscillator with quadratic nonlinearity is studied and an attention is focused on exploring a relationship between classic concepts of the approximate theory of nonlinear oscillations and the complex bifurcations and escape phenomena obtained by computer simulations. An analytical analysis of the Hill's type variational equation leads to approximate estimates for the blue-sky catastrophe and period doubling instability and eventually results in the approximate predictive criteria for the main escape region. The theoretical study and computer simulations are extended to the 1/2 subharmonic resonance and the analysis brings a new insight into the nonlinear phenomena, which occur in the higher frequency region. (Contract DE-AC02-76CH-03000)
(DE93-008365; FNAL-TM-1794) Avail: CASI HC A03/MF A01

TeV Superconducting Linear Accelerator (TESLA) cryostats consist of eight, 1-meter-long radio frequency (RF) cavity modules cryogenically connected in series with one focusing quadrupole. Each module contains one, 9-cell superconducting RF cavity operating at 1.3 GHz in a 1.8K helium bath. Individual modules are self-contained in the that they have their own input couplers, high order mode couplers, and tuning mechanisms. Services common to the entire cryostat consist of 70K and 4.5K thermal radiation shields, shield supply and return lines, a 1.8K helium supply line, and a gas helium return pipe. All cavity modules, the quadrupole, and cryogenic seances are contained in a single 12-meter-long vacuum vessel. The goal on TESLA is the successful fabrication and test of four complete cryostat assemblies. These cryostats will be installed in a string cooled to operating temperature, and powered. This test will address problems which may arise when modules are installed in a tunnel environment. It will also permit testing of the basic cooling concepts, measurement of static heat losses, and measurement of the RF performance of all cavities. DOE

(NASA-Case-LAR-14429-1; NAS 1.71:LAR-14429-1; US-Patent-Appl-SN-030894) Avail: CASI HC A03/MF A01

A heating head is presented for an induction heating apparatus that includes an elongated pole piece being substantially E-shaped in cross section and has a base, two outer legs, and a middle leg spaced from the two outer legs by two parallel gaps. A capacitor is connectable to a power source, and a coil wrapped around the middle leg of the pole piece. The coil has first and second ends connected to the capacitor. When a susceptor is placed in juxtaposition to distal ends of the two outer legs and the middle leg, the susceptor is heated by eddy currents induced in the susceptor due to the magnetic flux passing between the two outer legs and the middle leg along two parallel heating zones substantially centered over the two parallel gaps. INITIAL GRAPHICS EXCHANGE SPECIFICATION HYBRID MICROCIRCUIT APPLICATION PROTOCOL Final Report
Curtis Parks, Roger McCollough (Naval Command, Control and Ocean Surveillance Center, San Diego, CA.), Charles Azu (Naval Command, Control and Ocean Surveillance Center, San Diego, CA.), Larry Savage (Raytheon Co., Lexington, MA.), Patrick Toomey (Raytheon Co., Lexington, MA.), and Thomas Makoski (International TechneGroup, Inc., Milford, OH.) Jan. 1993 199 p Sponsored by Naval Command, Control and Ocean Surveillance Center
(PB93-175404; NIST/TN-1295) Avail: CASI HC A09/MF A03; SOD HC

An application protocol is an information systems view of a specific product. The view represents an agreement on the generic activities needed to design and fabricate the product, the agreement on the information needed to support those activities, and the specific constructs of a product data standard for use in transferring some or all of the information required.

This applications protocol describes the data for hybrid microcircuits products in terms of a product description standard called the Initial Graphics Exchange Specifications (IGES). More specifically, the Hybrid Microcircuit Assembly (HMA or hybrid) IGES Application Protocol (AP) specifies the mechanisms for defining and exchanging computer-models and their associated data for hybrid microcircuits in IGES format. The AP defines the appropriateness of the data items for describing the geometry of the various parts of a hybrid microcircuit (shape and location), the connectivity, and the processing and material characteristics. HANDSHAKE CIRCUITS: AN INTERMEDIARY BETWEEN COMMUNICATING PROCESSES AND VLSI Ph.D. Thesis - Philips Gloeilampenfabrieken N.V.
Cornelis Hermanus vanBerkel 1992 250 p
(ETN-93-93579) Avail: CASI HC A11/MF A03

Tangram and handshake circuits are introduced. The cost and performance of the circuits is the primary concern, as they make Very Large Scale Integration (VLSI) programming different from (and also more difficult than) traditional computer programming. The theory for handshake circuits makes up the body of the thesis. The key motion is that of the handshake process. A handshake process is a mathematical object that describes a handshake communication behavior. This handshake behavior may be that of the components of a handshake circuit. A handshake circuit is a set of handshake processes that satisfy a simple compositional rule. The behavior of the handshake circuit is defined through parallel composition of its constituents components and is, again, a handshake process. In appendix A, the delay insensitivity of handshake circuits is related to the theory reported in the literature. A calculus for handshake processes is developed. This calculus allows concise descriptions of behaviors of handshake components. A precise definition of Tangram is given. For a subset of Tangram, which we call Core Tangram, a formal denotation 'H' is given in terms of handshake processes. In appendix B, a link to the well known failure semantics of CSP (Communication Sequential Processes) is established. The translation of Tangram programs into handshake circuits by means of the mathematical function 'C' is described. For Core Tangram it is proven that the behavior of the compiled handshake circuit is equivalent to that of the original program in a well defined sense. The realization of handshake circuits in VLSI is considered. Issues such as peephole optimization, handshake refinement, data encoding, decompositions into VLSI operator networks, initialization, and testing are discussed. Some practical experiences with VLSI programming and silicon compilation are discussed. ESA

INSTRUMENTAL NEUTRON ACTIVATION ANALYSIS DEVELOPED FOR SILICON INTEGRATED CIRCUIT TECHNOLOGY Ph.D. Thesis - Philips Gloeilampenfabrieken N.V.
Marinus Leendert Verheijke 1992 225 p
(ETN-93-93581) Avail: CASI HC A10/MF A03

The merits of neutron activation analysis as a trace and ultratrace element analysis technique, as well as its relevance to silicon integrated circuit technology, were studied. The work was divided into four parts: the theory of the neutron activation process, the calibration method, and the influence of interfering reactions; the irradiation facilities and the determination of their characteristic parameters; the spectrometer system for the measurement of the gamma radiation and the evaluation of the spectra; and the accuracy of the method, the limits of detection, the practical performance of the analyses, and typical results in the field of silicon integrated circuit technology. The method is briefly compared with other modern trace analysis techniques which are also used for silicon integrated circuit technology, and the future possibilities of neutron activation analysis in this area are considered. (AD-D015723; US-Patent-5,198,783; US-Patent-Appl-SN-843677; US-Patent-Class-331-66) Avail: US Patent and Trademark Office

An optically controlled active impedance element particularly suited to serve as a tuneable inductive element for a microwave oscillator is disclosed. The optically controlled active inductive element is comprised of a circuit arrangement, preferably consisting of MESFET devices which exhibit a composite inductive characteristic, and whose inductance may be determined and controlled by direct illumination impinging on the MESFET's. The optically controlled active inductive element lends itself to being adapted to monolithic microwave integrated circuit (MMIC) applications and may find use in a wide variety of microwave circuits. Also disclosed, is an embodiment which used the optical controlled active impedance element, in a prescribed manner, to serve as a tunable capacitor for use in various microwave circuits. DTIC

(Contract W-31-109-eng-38)
(DE93-010658; ANL/CMT/RP-79188) Avail: CASI HC A02/MF A01

The Electrochemical Technology Program at Argonne National Laboratory (ANL) provides technical and programmatic support to DOE's Electric and Hybrid PropuLsion Division (DOE-EHP). The goal of DOE-EHP is to advance promising electric-vehicle (EV) propulsion technologies to levels where industry will continue their commercial development and thereby significantly reduce air pollution and petroleum consumption. In support of this goal, ANL provides research, development, testing/evaluation, post-test analysis, modeling, and technical management of industrial R&D contracts on advanced battery technologies for DOE-EHP. This report summarizes the battery-related activities undertaken during the period of 1 Oct. 1992 - 31 Dec. 1992. In this report, the objective, background, technical progress, and status are described for each task. The work is organized into the following task areas: 1.0 Project Management and Coordination; 2.0 Sodium/Metal Chloride R&D; 3.0 Microreference Electrodes for Lithium/Polymer Batteries; and 4.0 USABC Support. The Project Management and Coordination Task Area encompasses planning, organization, coordination, integration, and overall management of battery R&D projects for DOE-EHP, as well as work performed in behalf of DOE-directed inter-laboratory tasks. Section 3 of this report recounts the work performed during this reporting period on each task within these task areas. DOE

DEPARTMENT OF DEFENSE ADVISORY GROUP ON ELECTRON DEVICES: APPENDIX TO SPECIAL TECHNOLOGY AREA REVIEW ON MICROWAVE PACKAGING TECHNOLOGY
Feb. 1993 143 p
(AD-A262136) Avail: CASI HC A07/MF A02

Electronic packaging is identified as an area providing opportunity for system performance enhancement for both defense and commercial applications. The move to microwave/millimeter wave multi-chip assemblies with high density interconnects is causing a significant shift in the current practices of how packages are being designed and manufactured. The longer term trend is to move to subsystem or multi-level packaging schemes to achieve higher levels of system integration. Packaging costs are being emphasized early in system developments. Workshop goals include the following: (1) define packaging and interconnect technology and manufacturing problems/issues; (2) recommend solutions to these problems by developing an investment strategy that can be used by government and industry; and (3) build upon and couple to the 2-4 Mar. 92 aged electronics packaging technology star. STUDY OF GAIN IN C-BAND DEFLECTION CAVITIES FOR A FREQUENCY-DOUBLING MAGNICON AMPLIFIER
S. H. Gold, C. A. Sullivan, B. Hafizi, and W. M. Manheimer 26 Mar. 1993 20 p
(AD-A263132; NRL/MR/6793-93-7197) Avail: CASI HC A03/MF A01

We report an experimental study of the gain between two half-wavelength, 5.7 GHz TM 110 pillbox cavities, separated by a quarter-wavelength drift space, and powered by a 170A, 500 keV electron beam immersed in an 8.1 kG magnetic field. These cavities constitute the first section of a planned multicavity detection system, whose purpose is to spin up an electron beam to high transverse momentum for injection into the output cavity of a frequency-doubling magnicon amplifier. We have observed a gain of approximately 15 dB in the preferred circular polarization, at a frequency shift of approximately -0.18%, and a gain of approximately 3 dB in the opposite circular polarization, at a frequency shift of approximately +0.06%. These results are in good agreement with theory. DTIC

AN MCM/CHIP CONCURRENT ENGINEERING VALIDATION Final Quarterly Report, Jul. - Sep. 1992
Hector Moreno and Shuane Stark 31 Dec. 1992 32 p
(Contract MDA972-92-C-0022; ARPA Order 8363)
(AD-A262959; HVE-042-93) Avail: CASI HC A03/MF A01

We report on the MOST software system, which implements a concurrent physical design environment for Multi-Chip Modules. The system integrates the work of design teams distributed across a network and using different CAD systems. At present the following systems have been integrated: Cadence's Edge 2.1, Cadence's Allegro 6.1, AutoDesk's AutoCad 12.0, and Harris' Finesse. Software links were established allowing data from those systems to be shared through a ROSE (Rensselaer Object Storage Environment) database management developed under the sponsorship of the DICE program. The code was written in C++ and uses various methods to feed the information in and obtain it out of the design systems: IGES for Allegro, SKILL for Edge and dfile for Finesse, while the AutoCad link is a direct one. The DDR2 (Digital Drop Receiver, version 2) multi-chip module from Harris was entered into the system and routed utilizing a redundant route scheme. The exercise used a concurrent approach, the data defining parts and placement entered through Finesse, the parts modified in Edge, the route done in Allegro and the final merge and verification performed with the Edge tool. DTIC

TEMPERATURE COMPENSATED LITHIUM BATTERY ENERGY MONITOR Patent
Albert M. Bates, inventor (to Navy) 10 Nov. 1992 10 p Filed 3 Apr. 1991
(AD-D015680; US-Patent-5,162,741; US-Patent-Appl-SN-682159; US-Patent-Class-324-431) Avail: US Patent and Trademark Office

A system is provided for temperature compensating and monitoring the energy of a lithium battery. In this method, a temperature compensation factor is determined according to a value of temperature. A determination is made of the energy usage while the battery operates at that temperature. The temperature usage is then compensated in accordance with the temperature compensation factor. A second temperature, along with a second temperature compensation factor, is determined. A second energy level is determined and compensated as described for the first. A cumulative energy usage is determined according to the first and second compensated energy usage values. DTIC

SYNTHESIS TECHNIQUES AND ANALYSIS TOOLS FOR ON-CHIP FAULT-TOLERANCE Final Report
Dhiraj K. Pradhan 1992 17 p
(Contract N00014-91-J-1404)
(AD-A263167) Avail: CASI HC A03/MF A01

Significant research performed on a broad range of issues related to fault-tolerant design both at the chip and system level are summarized. First discussed is an integrated approach, currently under development for integrating concurrent checking with BIST. The goal is to generate synthesis tools to develop low-cost fault-tolerant VLSI chip design tools that are both easy to test as well as being robust against operational errors. REACT, a tool currently under development for fault-tolerant architecture characterization is reviewed. An on-going research on the development of fault-tolerant architectures is presented. DTIC

PROTOTYPE AND SHORT-RUN PRINTED CIRCUIT BOARD CREATION Final Technical Report, Sep. 1990 - 1992
Darryl Hoelder Mar. 1993 23 p
(AD-A263245; AD-E952002; AMSMI/TR-RD-WS-92-13) Avail: CASI HC A03/MF A01

The knowledge and experience developed within this directorate over the past several months in the fabrication of Printed Circuit Board (PCB) techniques is described. Due to the limited quantity of identical, custom-made PCB's needed for use in the laboratory, it is both cost-effective and less time-consuming to fabricate PCB's in-house, than to employ an outside supplier. The combination of equipment and techniques permits the fabrication of single and short-run PCB's of up to 8 by 10 inches, with little problem. The system described has been in place for about two years after being developed over a longer period. As with any technique-dependent process, experience and learning will contribute to better quality in the product. However, this set of equipment and the techniques described should yield reasonable results very quickly after the start of operation. Continuing improvement of these techniques is taking place, but there now exists a capability for the creation of small quantities of PCB's sufficient for laboratory uses. The design techniques used are directly useful for the creation of materials required by an outside jobber for producing a large quantity of PCB's, should that be required. DTIC

NSF TOKYO REPORTS: JAPANESE R AND D PROJECTS ON MICRO- AND NANOFABRICATION AND RELATED BASIC RESEARCH PROJECTS
Jan. 1993 31 p
(PB93-181261) Avail: CASI HC A03/MF A01

The report examines Japanese projects believed to fall in the general area of micro- and nanofabrication technologies or nanoscopic materials and structures, including basic research projects with the potential of leading to future development of relevant technologies. Listed projects were selected as a result of discussions with officials of the respective agencies, in the absence of any ready-made or official list of such projects. Projects are grouped together under the government programs supporting them, with information on title, duration, and total budget in Japanese yen. NTIS

RESEARCH AND DEVELOPMENT OF LITHIUM SECONDARY BATTERIES FOR LOAD CONDITIONER USE, VOLUME 2
N. Terada, K. Takei, K. Ishihara, T. Iwahori, T. Tanaka, H. Mishima, and K. Takeuchi Jun. 1992 28 p
(DE93-781329; CRIE-T-91078) Avail: CASI HC A03/MF A01

Results of evaluation are reported on cycle life/power performance of square lithium/vanadium oxide secondary batteries (25Wh class) trially manufactured as a basic unit for the battery energy storage system which can be installed at home. Experimental results of charge/discharge cycle and power characteristics verify that the battery is highest in performance of all the large capacity lithium secondary batteries which have been made public. The lithium secondary battery with a large capacity more than 10Wh by operation of 50% DOD (depth of discharge) achieves 420 cycles, the highest level. The amount of energy taken out by about one-hour rate discharge is reduced only to about 85% of that by 8-hour rate discharge, which is a favorable result as the lithium secondary battery which operates at normal temperature. However, at the end of one-hour rate discharge, some of the battery surface temperatures rise about 10 C, and this may cause inhibition in the structure as a pair battery. The following method is suggested for improvement: thickness of the cathode of the main heating part is reduced to promote thermal radiation, and the cathode area is enlarged to decrease the current density. FREQUENCY DEPENDENT ELECTRICAL PROPERTIES OF MINERALS AND PARTIAL-MELTS
J. J. Roberts and J. A. Tyburczy (Arizona State Univ., Tempe.) 26 Aug. 1992 35 p Presented at the 11th Workshop on Electromagnetic Induction in the Earth, Wellington, New Zealand, 26 Aug. - 2 Sep. 1992
(Contract W-7405-eng-48)
(DE93-009254; UCRL-JC-111340; CONF-9208215-1) Avail: CASI HC A03/MF A01

Frequency-dependent impedance of olivine, dunites, metapelites, and partial-melts between 10(sup -4) and 10(sup 5) Hz, when plotted in complex impedance plane, reveal arcs corresponding to different conduction mechanisms. In polycrystalline materials, two impedance arcs related to material properties (as opposed to electrode properties) are observed. The mechanisms occur in series; they are interpreted as grain interior or bulk conduction, grain boundary conduction, and sample-electrode interface effects, from highest to lowest frequency, respectively. Natural dunitic rocks show similar behavior. The grain boundaries do not enhance the conductivity of any of the materials (series electrical behavior) and sometimes limit the total conductivity of the grain interior-grain boundary system. Olivine-basalt partial-melts also show at least two conduction mechanisms occurring in series over 10(sup -4)-10(sup 5) Hz. Isolated melt pockets show series conduction, while interconnected melt phase show parallel conduction. Because laboratory electrical measurements are used in inversion of field EM data to derive conductivity vs depth profiles, it is important to understand the frequency dependent behavior of Earth materials. Activation energies determined from studies that measure conductivity at a single frequency may be erroneous because of the shift in frequency of different conduction mechanisms as temperature is varied. ANALYSIS OF AN MCG/FUSE/PFS EXPERIMENT
I. R. Lindemuth, D. G. Rickel, and R. E. Reinovsky 1993 9 p Presented at the 6th International Conference on Megagauss Magnetic Field Generation and Related Topics, Albuquerque, NM, 9-12 Nov. 1992
(Contract W-7405-eng-36)
(DE93-007355; LA-UR-93-0044; CONF-921133-17) Avail: CASI HC A02/MF A01

The Los Alamos PROCYON high-explosive pulsed power (HEPP) implosion system is intended to produce 1 MJ of soft x-radiation for fusion and material studies. The system uses the MK-IX magnetic flux compression generator to drive a 'slow' opening switch which, upon operation, connects the output of the MK-IX generator to a plasma flow switch, which, in turn, delivers current to a rapidly imploding load. The closing switch isolates the plasma flow switch (PFS) and load from any precursor current which might arise due to the finite impedance of the opening switch during its closed phase. In that experiment, our first test, the MK-IX generated approximately 16 MA and 8.2 MJ, and approximately 9.8 MA and 1.15 MJ were delivered to a fixed inductive load in 8-10 microseconds. Computations performed after the experiment, taking into account experimental variables which could not be accurately predicted prior to the experiment, were in satisfactory agreement with all experimental observations, including a double-peaked dI/dt signal which indicated a particular trajectory of the copper fuse material through density-temperature space. Prompted by our success with a fixed load, a second experiment was performed using the MK-IX/fuse/STS combination to drive a plasma flow switch. The objectives of the experiment were to observe the ability of the fuse/STS combination to drive a plasma flow switch and to evaluate our ability to predict system performance. The details of the experiment, the measurements taken, and the data reduction process have previously been reported. The MK-IX produced approximately 22 MA, and approximately 10 MA was delivered to the PFS, which moved down the coaxial barrel of the assembly in an intact manner in about 8 microseconds. The results of our computational analysis of the experiment are presented. DOE

ELECTRICAL RELAXATION IN ACID-FORM NAFION Interim Technical Report, Mar. 1992 - Apr. 1993
J. J. Fontanella, M. G. McLin, and M. C. Wintersgill 16 Apr. 1993 29 p
(Contract N00014-93-WR-24016)
(AD-A263558; Rept-TR-3) Avail: CASI HC A03/MF A01

Electrical relaxation studies of acid-form NAFION-117 membranes dried in situ at 380 K in vacuum have been performed. Significant electrical conductivity is found and the data are found to be non-Arrhenius. The results are converted to the electrical modulus representation and a conductivity relaxation is observed. A stretched exponential is best-fit to the conductivity relaxation and again, non-Arrhenius behavior is observed for the peak position. Finally, at low temperatures, a new dielectric relaxation peak is found which has an activation enthalpy of about 0.57 eV (13 kcal/mol). This relaxation is analogous to the Gamma-relaxation observed in mechanical relaxation studies. DTIC

IMPROVED FIELD EMITTER CURRENT DENSITIES AND STABILITY THROUGH THE APPLICATION OF A PROPRIETARY PROCESS Quarterly Report No. 4, Dec. 1992 - Feb. 1993
Feb. 1993 14 p
(Contract MDA972-92-C-0033)
(AD-A263464) Avail: CASI HC A03/MF A01

As detailed in the previous reports, the necessary current densities (60 A/sq cm), linear current densities (3 mA/mm), and stability (greater than 2 days) to meet the contract goals (at least theoretically) have been achieved. The next step is to fabricate three terminal devices to demonstrate the remaining contract goal--a one GHz current gain cutoff frequency (f(sub t)). During this period the design of the three terminal devices was completed, and the mask set was received at the end of the period. RF modulation at one GHz was also demonstrated as high as 2 GHz with an incremental gain in s(sub 21) of 0.5 dB. DTIC

IMPROVED DESIGN CONCEPTS FOR MILLIMETER WAVE POWER SOURCES Final Report, 15 Mar. 1992 - 14 Mar. 1993
V. L. Granatstein, H. Guo, and Y. Carmel 14 Mar. 1993 23 p
(Grant AF-AFOSR-0142-90)
(AD-A264060; AFOSR-93-0311TR) Avail: CASI HC A03/MF A01

This progress report summarizes the work done during the period from 15 Mar. 1992 to 14 Mar. 1993. In the past year, we have designed a phase-locked, harmonic, inverted gyro-twistron, known as the phigtron. The phigtron combines a subharmonic gyro-TWT amplifier input section with a gyroklystron type output cavity. The phigtron is expected to reach much higher phase-locking gain and wider bandwidth than the two cavity phase-locked gyroklystron oscillator. The efficient and stable operation of this phase-locked harmonic gyrotron will be obtained through the implementation of mode selective interaction circuits. The proof-of-principle cold test results of such circuitry have recently been obtained indicating that the technical realization of this research concept is feasible. The construction of the phigtron hot test laboratory facility is now actively proceeding. DTIC

CHARACTERIZATION OF LITHIUM ELECTRODE SURFACE IN LITHIUM SECONDARY BATTERIES BY IN SITU RAMAN SPECTROSCOPIC METHODS Final Report, 1 Sep. 1989 - 31 Dec. 1992
Hiroyasu Tachikawa 24 Mar. 1993 23 p
(Contract DAAL03-89-G-0105)
(AD-A263728; ARO-27241.1-CH-SAH) Avail: CASI HC A03/MF A01

Surface layers on lithium electrodes formed in several solvents including dimethyl carbonate (DMC), diethyl carbonate (DEC), polyethylene glycol 400 dimethyl ether (PEG400DME), and propylene carbonate (PC) have been studied by Raman spectroscopy. Both DMC and DEC were used singly, and also mixed with either methyl acetate or methyl formate. The Raman spectra showed that passive films formed on the Li surface in different solvents may have different chemical structures, which changed during the charging and discharging processes. A solid film of fullerene C60, which could be used as a cathode in Li rechargeable batteries, was examined in the PEG400DME solution by both electrochemical and Raman spectroscopy. Cyclic voltammograms (CV's) showed five redox peaks which suggested the formation of C60(-), C60(2-), C60(3-), C60(4-), and C60(5-). Raman spectra obtained from thin C60 film indicated that the thin fulleride film dissolved in the PEG400DME/LiClO4 solution at negative potentials. DTIC

AN EXPLOSIVELY ACTUATED ELECTRICAL SWITCH USING KAPTON INSULATION
Douglas G. Tasker, Richard J. Lee, and Paul K. Gustavson Mar. 1993 52 p
(AD-A263835; NSWCDD/TR-92/124; ARO-29354.3-MA) Avail: CASI HC A04/MF A01

The designs and manufacture of several explosively-actuated, electrical closing switches are described. The switches are fast operating; can handle very high electrical power; are highly energy efficient, with low inductance and low resistance, when closed; but are able to withstand very high voltages when open. The switches exploit shock-induced conductivity effects in polypyromellitimide insulators (PPMI), e.g., Kapton. The key to the successful operation of the switches is to use them in the transverse mode of operation, i.e., where the detonation wave travels transverse to the applied electric field. Through the research described in this report, the many factors that are crucial to the design of an effective switch have been identified. Various switch designs and the results of using them in numerous applications are provided. DTIC

IMPROVED FIELD EMITTER CURRENT DENSITIES AND STABILITY THROUGH THE APPLICATION OF A PROPRIETARY PROCESS Quarterly Report No. 2, Jun. - Aug. 1992
Aug. 1992 5 p
(Contract MDA972-92-C-0033)
(AD-A264048) Avail: CASI HC A01/MF A01

This brief report highlights the technical progress made during the three-month period covered on the contract. The contract goals are to demonstrate a three-terminal vacuum microelectronic device having a current gain cutoff frequency f(sub t) of at least one GHz at a current density of at least 5 A/sq cm, stable over a period of 2 hours or more. The previous report described the advantages of the single-crystal approach being employed for the contract. Linear current densities of 0.8 mA/mm were reported, within a factor of 3 needed to theoretically satisfy the performance goals of the contract (Task 1 of the SOW). Furthermore, these current densities were realized in conventional 10(exp 9) Torr vacuum levels without a UHV bake-out as is necessary for non-crystalline structures. The current emission would remain stable over a period in excess of several days. During this period the focus was on improving the linear current density to the value needed to achieve f(sub t) greater than or equal to 1 GHz. To better communicate the impact of the work done during the period, the results are presented first, followed by the experimental work behind these results. DTIC

TOTAL DOSE TESTS FOR THE PROMICS-3 INSTRUMENT

Raimo Verkasalo Jan. 1991 43 p
(VTT-TIED-1203; ISBN-9-51-383929-X; ETN-93-93770) Copyright Avail: CASI HC A03/MF A01

The sensitivity of some analog and digital Integrated Circuits (IC's) to ionizing radiation was tested in order to evaluate their potential usefulness especially in the PROMICS-3 instrument. The PROMICS-3 is a plasma instrument to be flown on the Russian Interball satellites. The radiation tolerance requirement of the auroral Interball satellite is about 45 krad/year inside a shielding of 4 mm aluminum. The IC's tested were: AD571 A/D-converter, ADDAC80 D/A-converter, LF442A and PM108A operational amplifiers, MPREF01 voltage reference, STC SPXO 6 MHZ oscillator, 4N55 optocoupler, MC51C98 and CY7C164 16k*4 static CMOS RAM. Co-60 was used as the irradiation source. The test methods and results are described. The RAM circuits failed between 10 and 20 krad. D/A- and A/D-converters degraded only slightly after 100 krad, but one of the A/D converters failed functionally at 190 krad. The LF442A began to degrade in the test connection at 100 krad, and PM108A at 30 krad. The output voltage of the voltage reference MPREF101 increased about 20 mV after 100 krad. No change was observed in the output frequency of the STC SPXO oscillator even after 300 krad. The current transfer ratio of the 4N55 decreased continuously to about 75% of the initial value after 100 krad. ESA

FOREIGN TECHNOLOGY ASSESSMENT: ENVIRONMENTAL EVALUATION OF A RADIATION-HARD OSCILLATOR/DIVIDER
M. A. Dvorack Mar. 1993 41 p
(Contract DE-AC04-76DP-00789)
(DE93-011481; SAND-92-2473) Avail: CASI HC A03/MF A01

Salford Electrical Instruments, Ltd., and the General Electric Company's Hirst Research Center, under contract to the United Kingdom's (UK) Ministry of Defence, developed a radiation-hard, leadless chip-carrier-packaged oscillator/divider. Two preproduction clocks brought to Sandia National Laboratories (SNL) by a potential SNL customer underwent mechanical and thermal environmental evaluation. Because of the subsequent failure of one device and the deteriorating condition of another device, the devices were not subjected to radiation tests. The specifics of the environmental evaluation performed on these two clocks and the postmortem analysis of one unit, which ultimately failed, are described. Clock startup time versus temperature studies were also performed and compared to an SNL-designed clock having the same fundamental frequency. DOE

TEST STRUCTURE TO MICROCIRCUIT CORRELATION Final Report, Mar. 1990 - Jun. 1992
Edward W. Enlow Apr. 1993 38 p
(Contract F29601-89-C-0014)
(AD-A264157; MRC/ABQ-R-1467; PL-TR-92-1013) Avail: CASI HC A03/MF A01

This Parametric Analysis of Radiation effects software development is given the general title PARA. This report describes the development of algorithms and source codes for the simulation of radiation effects on CMOS IC's. The project concentrated on the simulation of total dose effects and the ways to establish/predict the operational lifetime and radiation tolerance of IC's. The PARA switch level simulator incorporates the capability to assign bias dependent postirradiation drive parameters to transistors within a microcircuit and to calculate propagation delays based on those parameters. This permits test vectors to be assigned based on worst case postirradiation propagation delays. DTIC

ORDNANCE THERMAL BATTERY Patent
Louis Pracchia, inventor (to Navy), Ronald F. Vetter, inventor (to Navy), and Darwin Rosenlof, inventor (to Navy) 27 Apr. 1993 7 p Filed 5 Nov. 1990
(AD-D015722; US-Patent-Class-102-207) Avail: US Patent and Trademark Office

This invention pertains to thermal battery activated by external heat comprising an anode, e.g., composed of a lithium-aluminum alloy, a cathode, e.g., composed of iron disulfide, and an electrolyte, e.g., a lithium chloride-potassium chloride eutectic, the electrolyte being inactive at ambient temperature but being activated by melting at a predetermined temperature when exposed to external heating. The battery can be used as a sensor or to ignite pyrotechnic and power electronic devices, in system for reducing the hazard of ordnance exposed to detrimental heating. A particular application is the use of the battery to activate a squib to function in conjunction with one or more other components, to vent an ordnance case, preventing its explosion in a fire. DETECTING RESIDUE ON A PRINTED CIRCUIT BOARD: AN APPLICATION OF THE BOUNDARY CONTOUR/FEATURE CONTOUR SYSTEM
M. W. Koch and M. M. Moya 1992 4 p Presented at the World Congress on Neural Networks, Portland, OR, 11-15 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-006283; SAND-92-2901C; CONF-930741-2) Avail: CASI HC A01/MF A01

We have developed a video detection algorithm for measuring the residue left on a printed circuit board after a soldering process. Oblique lighting improves the contrast between the residue and the board substrate, but also introduces an illumination gradient. The algorithm uses the Boundary Contour System/Feature Contour System to produce an idealized clean board image by discounting the illuminant, detecting trace boundaries, and filling the trace and substrate regions. The algorithm then combines the original input image and ideal image using mathematical models of the normal and inverse Weber Law to enhance the residue on the traces and substrate. The paper includes results for a clean board and one with residue. DOE

ON THE IDEALITY OF USING A STEP-FUNCTION CURRENT IN A METALLIC FOIL TO SIMULATE A STEP-FUNCTION HEAT-FLUX SOURCE Final Report, Jan. - Feb. 1992
Martin S. Miller May 1993 23 p
(DA Proj. 1L1-61102-AH-43)
(AD-A264627; ARL-MR-65) Avail: CASI HC A03/MF A01

An exact solution is derived to the one-dimensional, time-dependent, heat-conduction equation for a two-layer, semi-infinite, composite solid with sudden uniform heat generation in the surface layer, no heat transfer through the surface plane, and uniform initial temperature. The interface between the two layers is assumed to have no thermal contact resistance. This solution enables a discussion of the ideality with which a step-function electric current in a metallic foil can generate a step-function heat flux into a contacting semi-infinite solid. Previous measurements of thermal diffusivity (based on the above conditions) have relied on the idealized constant-flux solution for data reduction. It is shown here that the temperature errors in the substrate arising from non-ideality of the constant-flux boundary condition increase with depth into the substrate, foil thickness, and decreasing thermal conductivity/diffusivity of the substrate. PLACEMENT OF CELLS: THEORY AND SOLUTION OF A QUADRATIC 0/1 OPTIMIZATION PROBLEM Ph.D. Thesis [PLAZIEREN VON ZELLEN: THEORIE UND LOESUNG EINES QUADRATISCHEN 0/1-OPTIMIERUNGSPROBLEMS]
Robert Weismantel 1992 234 p In GERMAN
(ETN-93-94182) Avail: CASI HC A11/MF A03

The placement problem by design of electronic chips is studied in the framework of very large scale integration. Methods for modeling placement are presented, such as min-cut heuristics, simulated annealing, and a continuous quadratic optimization method based on relaxation. The 'sea of cells' concept was chosen and a quadratic 0/1 optimization problem was described with a graph theory formulation. Variations of the problem and existence of polynomial, epsilon approximative algorithms were discussed. The problem was solved with heuristic decomposition method, with 16 locations for each cell and with 9 locations for each cell. A dynamic decomposition process was also described and a linear Lagrange relaxation solution was proposed. The clustering problem was introduced to reduce magnitude order of placement problem. The r-clustering polytope was presented from a polyhedral point of view. Several classes of facets were described by inequalities, which combine nodes and branches in the following cases: roof dual and disjuncted stars, roof dual and a tree, roof dual and a star, and roof dual and a branch. STUDY ON DIAMOND SEMICONDUCTOR
27 Nov. 1991 31 p
(DE92-531076; ETDE/JP-MF-92531076) Avail: CASI HC A03/MF A01 (US Sales Only)

The objectives of this study were to synthesize a diamond semiconductor using the CVD process, clarify the basic characteristics of the particular semiconductor, and establish a method to synthesize semiconductors having high crystallinity. The synthesizing method used was a microwave plasma CVD process. This method has a slow growth rate, but has good plasma stability and good reproducibility of the synthesizing condition with less contamination from electrodes. The dopants used were boron and phosphorus. The study included an experiment on deposition onto a diamond substrate in addition to polycrystalline films, which enabled a deposition onto a substrate with a diameter of 10 cm. A secondary ionic mass analyzer was used to discuss the relative change in impurity concentrations according to the synthesizing conditions and the crystal face dependence under identical conditions. The crystallinity received appreciable effects from the carbon concentration and the substrate temperature among the synthesizing conditions. Temperature dependence of the electric conductivity and activation energies were derived. The hole mobility was measured on mono-crystal film specimens grown on the face of a high-pressure synthesized diamond (100). DOE

INVESTIGATION OF METHODS FOR THE MEASUREMENT OF SMALL ELECTRON BUNDLE CURRENTS Thesis - Amsterdam Univ. [EEN ONDERZOEK NAAR METHODEN VOOR HET METEN VAN LAGE ELEKTRONENBUNDELSTROMEN]
H. J. Hollander May 1992 56 p In DUTCH
(DIGEL-1992-4; ETN-93-93307) Avail: CASI HC A04/MF A01

Methods for the measurement of the current of an electron bundle in a linear electron accelerator were investigated. The bundle is in vacuum and should not be affected by the measurement. The maximum current is 250 microA. The Faraday effect is too weak for the current detection. A measurement based on a glass fiber with a magnetostrictive coating is possible but only with a bandwidth of 8 Kkz. The signal to noise ratio of an inductive detection method depends strongly on the core material, the properties of which have to be further investigated. A capacitive transducer consisting of two conducting cylinders axially suspended around the bundle has to be preferred. A method to determine the signal to noise ratio of capacitive and inductive detectors is outlined. ESA

A 250 mA TOROID MONITOR FOR THE MEASUREMENT OF THE BUNDLE CURRENT IN THE STRETCHER MODE OF AmPS [250 MA TOROIDE MONITOR VOOR HET METEN VAN DE BUNDELSTROOM IN DE STRETCHERMODE VAN AMPS]
J. T. vanEs and J. C. Boes 1992 13 p In DUTCH
(DIGEL-1992-1; ETN-93-93305) Avail: CASI HC A03/MF A01

Toroid monitors were developed to measure the bundle current of the storage ring AmPS (Amsterdam Pulse Stretcher). A toroid monitor consists of a current transformer around the bundle pipe and a current to voltage converter. The transformer is located in a radiation free environment. Therefore, since the required bandwidth is between 100 and 3 MHz, a transmission line to the converter electronics is necessary. This leads to special requirements for the converter, which also contains a zero line restorer and an output circuit that can drive 50 ohm lines. ESA

Applications of high-temperature superconducting (HTSC) materials, especially thin-film YBaCuO, to microelectronic devices have been limited by materials-related fabrication problems. Magnetic-flux-coupled devices are less limited by these problems but have not been widely explored. The innovation for this program was demonstration of a flux-coupled device that was: (1) simple to fabricate, (2) based on silicon substrates, (3) shows excellent flux-flow dynamics, and (4) can be implemented in switching or amplifying circuits. In Phase 1 we have demonstrated our potential for developing this device utilizing high critical-current YBCO thin films on yttria-stabilized zirconia (YSZ)-buffered Si substrates. Our devices are designed to take advantage of these new materials opportunities, are within realistic materials and fabrication constraints, and are projected to operate from dc to at least 10 GHz. The flux-flow devices (FFD) we have fabricated, include: externally-activated magnetic switch, superconducting transformer, and flux-flow (transistor-like) switch. The use of Si wafers not only allows high-quality quality films on large (or very thin) and inexpensive substrates, but also many design configurations with great potential for wafer-scale, hybrid integration with semiconductor electronics. (LAAS-92354; ETN-93-94235) Avail: CASI HC A11/MF A03

The design and the fabrication of electronic functions in Microwave Monolithic Integrated Circuits (MMIC) are presented. These functions have applications in telecommunication satellites with onboard regeneration and high bit rate telemetry for new generations of Earth observation satellites. The four phase modulator was processed in two foundry runs with the goal to improve its performances. Particularities of the developed modulator are no bias power requirement and the absence of any tuning. The first versions of a four phase demodulator and of a phase comparator were implemented and tested. The design of these circuits needed a full simulation and modeling work in the nonlinear domain. Other functions required for applications were processed. The good results obtained in all the circuits validate demodulator and modulator concepts. Developed functions could be used in high bit rate telemetry and in onboard regeneration microwave subsystems. ESA

Critical phenomena has been the subject of physics research for many years. However, only in recent years has the research effort become intense. The current intensity has caused the study of critical phenomena to be grouped into a previous older era and a present contemporary era. Turbidity cell filling with methanol cyclohexane is one of the first steps toward a further understanding of critical phenomena. Work performed during the research period is outlined. During this period, research was spent developing apparatus and techniques that will make it possible to study critical phenomena through turbidity measurements on methanol cyclohexane. Topics covered range from the orientation of turbidity cell parts for assembly to the filling apparatus and procedure used when th cell is built. The last section will briefly cover some of the observations made when viewing the cell in a controlled water bath. However, before mention is made of the specifics of the summer research, a short introduction to critical phenomena and turbidity and how they relate to this experiment is provided. CASI

ESTIMATION OF DROPLET COLLISION FREQUENCY IN A SPRAY
J. R. Zurlo (Wisconsin Univ., Madison.), C. Presser, and H. G. Semerjian 1992 6 p Presented at the ILASS-AMERICAS 1992, San Ramon, CA, 18-20 May 1992
(Contract DE-AI01-86CE-90213)
(DE93-007991; CONF-9205307-1) Avail: CASI HC A02/MF A01

An estimate of droplet collision frequency was obtained in a pressure-atomized fuel spray. Measurement of the vertical linear depolarization ratio was used to provide information on droplet sphericity which in turn was used to determine droplet collision frequency. The results indicate that droplet collision frequency increases near the spray boundary where the droplet number density is a maximum. DOE

LIMITATIONS OF THE IDEAL PHASE-DOPPLER SYSTEM: EXTENSION TO SPATIALLY AND TEMPORALLY INHOMOGENEOUS PARTICLE FLOWS WITH AN APPLICATION TO DIESEL SPRAYS
K. D. Marx and C. F. Edwards Dec. 1992 58 p Presented at the 6th International Symposium on the Application of Laser Techniques to Fluid Mechanics, Lisbon, Portugal, 20 Jul. 1992
(Contract DE-AC04-76DR-00789)
(DE93-009447; SAND-92-8540; CONF-9207151-1) Avail: CASI HC A04/MF A01

The effect of the single-particle constraint on the response of phase-Doppler instruments is determined for particle flows which are spatially nonuniform and time-dependent. Poisson statistics are applied to particle positions and arrival times within the phase-Doppler probe volume to determine the probability that a particle is measured successfully. It is shown that the single-particle constraint can be viewed as applying spatial and temporal filters to the particle flow. These filters have the same meaning as those that were defined previously for uniform, steady-state sprays, but in space- and time-dependent form. Criteria are developed for determining when a fully inhomogeneous analysis of a flow is required and when a quasi-steady analysis will suffice. A new bias due to particle arrival time displacement is identified and the conditions under which it must be considered are established. The present work provides the means to rigorously investigate the response of phase-Doppler measurement systems to transient sprays such as those which occur in diesel engines. To this end, the results are applied to a numerical simulation of a diesel spray. The calculated hypothetical response of the ideal instrument provides a quantitative demonstration of the regimes within which measurements can accurately be made in such sprays. DOE

ACCELERATED MOTION OF RIGID SPHERES IN UNSTEADY FLOWS AT LOW TO MODERATE REYNOLDS NUMBERS Ph.D. Thesis
Eugene Jen-Ming Chang 1992 228 p
Avail: Univ. Microfilms Order No. DA9308787

A direct numerical simulation, based on spectral methods, has been used to compute the time dependent, axisymmetric viscous flow past a rigid sphere. Both oscillatory flow about a zero mean and flows with a constant acceleration or deceleration have been investigated. The simulation has been verified for steady flow conditions, and for unsteady flow there is excellent agreement with Stokes flow theory at very low Reynolds numbers. At moderate Reynolds numbers, around 20, there is good general agreement with available experimental data for oscillatory motion. Under steady flow conditions no separation occurs at Reynolds numbers below 20, however in an oscillatory flow a separation bubble forms on the decelerating portion of each cycle at Reynolds numbers well below this. As the flow accelerated again, the bubble detaches and decays, while the formation of a new bubble is inhibited till the flow again decelerates. Similar features are observed for constant deceleration or acceleration of the flow. The contribution of the pressure to the resultant force on the sphere includes a component that is well described by the usual added mass term even when there is separation. However the reversed flow within the separation bubble, under decelerating flow conditions, strongly modifies the frictional component of the force and may produce an effective negative drag. Dissert. Abstr.

APPLICATIONS OF UNITARITY IN THE STANDARD MODEL Ph.D. Thesis
Leo P. H. M. deWit 1992 72 p
Avail: Univ. Microfilms Order No. DA9308301

Unitarity is a crucial ingredient of any quantum field theory. The requirement that the sum of probabilities of all possible consequences resulting out of a given initial situation equals 100 percent is inescapable. We study the practical consequences that can be derived from the unitarity requirement. We show how unitarity can be proved in a quantum field theory. First the old proof by Veltman is reviewed. Next a new derivation of the Cutkosky-Veltman cutting rules is given. As an application, we discuss the constraints on the photon self energy and the resulting effect on the photon propagator. Next the decomposition of transition amplitudes into partial wave amplitudes is discussed. Bounds on these partial waves are derived. The concept of 'partial wave unitarity' is explained. Assuming that for weak interactions the lowest order Feynman diagrams will always dominate the higher order diagrams, bounds can be put on certain parameters in the standard model Lagrangian. An upper limit for the Higgs mass is derived, and the four vector boson vertex is constrained. Finally we study the partial wave decomposition for off-shell scattering processes. We find that such off-shell partial waves cannot be constrained, as opposed to the on-shell partial waves. Dissert. Abstr.

A NEW FLUX CONSERVING NEWTON'S METHOD SCHEME FOR THE TWO-DIMENSIONAL, STEADY NAVIER-STOKES EQUATIONS
James R. Scott and Sin-Chung Chang Jun. 1993 47 p Sponsored by NASA, Washington
(RTOP 505-62-52)
(NASA-TM-106160; E-7895; NAS 1.15:106160) Avail: CASI HC A03/MF A01

A new numerical method is developed for the solution of the two-dimensional, steady Navier-Stokes equations. The method that is presented differs in significant ways from the established numerical methods for solving the Navier-Stokes equations. The major differences are described. First, the focus of the present method is on satisfying flux conservation in an integral formulation, rather than on simulating conservation laws in their differential form. Second, the present approach provides a unified treatment of the dependent variables and their unknown derivatives. All are treated as unknowns together to be solved for through simulating local and global flux conservation. Third, fluxes are balanced at cell interfaces without the use of interpolation or flux limiters. Fourth, flux conservation is achieved through the use of discrete regions known as conservation elements and solution elements. These elements are not the same as the standard control volumes used in the finite volume method. Fifth, the discrete approximation obtained on each solution element is a functional solution of both the integral and differential form of the Navier-Stokes equations. Finally, the method that is presented is a highly localized approach in which the coupling to nearby cells is only in one direction for each spatial coordinate, and involves only the immediately adjacent cells. A general third-order formulation for the steady, compressible Navier-Stokes equations is presented, and then a Newton's method scheme is developed for the solution of incompressible, low Reynolds number channel flow. It is shown that the Jacobian matrix is nearly block diagonal if the nonlinear system of discrete equations is arranged approximately and a proper pivoting strategy is used. Numerical results are presented for Reynolds numbers of 100, 1000, and 2000. Finally, it is shown that the present scheme can resolve the developing channel flow boundary layer using as few as six to ten cells per channel width, depending on the Reynolds number. Preliminary fluid nitrogen flow data are reported for a five-brush, ceramic-coated-rub-runner brush seal system, where the brushes and the rub runner were placed at each end of a centrally pressurized multifunction tester ('back-to-back' set of brushes) and tested at rotor speeds of 0, 10, 18, and 22.5 krpm. After testing, both the brushes and the ceramic-coated rub runner appeared pristine. The coating withstood both the thermomechanical and dynamic loadings with minor wear track scarring. The bristle tips showed some indication of material shearing (smearing) wear. The Ergun porous flow equation was applied to the brush seal data. The Ergun relation, which required heuristic information to characterize the coefficients, fit the gaseous data but was in poor agreement with the fluid results. The brush seal exit conditions were two phase. Two-phase, choked-flow design charts were applied but required one data point at each rotor speed to define the (C(sub f)A x Constant) flow and area coefficients. Reasonable agreement between prediction and data was found, as expected, but such methods are not to be construed as two-phase-flow brush seal analyses. Author (revised)

DENSE INCLINED FLOWS: THEORY AND EXPERIMENTS
1992 7 p
(Contract DE-AC22-91PC-90183)
(DE93-011452; DOE/PC-90183/T6) Avail: CASI HC A02/MF A01

Rapid, gravity-driven flows of granular materials down inclines pose a challenge to our understanding. Even in situations in which the flow is steady and two-dimensional, the details of how momentum and energy are balanced within the flow and at the bottom boundary are not well understood. Thus we have undertaken a research program integrating theory, computer simulation, and experiment that will focus on dense entry flows down inclines. Its goal is to understand the regime of inclined flow that involves a large, relatively passive mass of granular material moving above a narrow region of intensely sheared, colliding grains. The effort involves the development of theory informed by the results of simultaneous computer simulations and the construction, instrumentation, and use of an experimental facility in which the variables necessary to assess the success or failure of the theory can be measured. In the present reporting period, we have completed a series of experiments to measure the collision properties of various small particles. Results for 3mm glass beads are presented here. In addition, we have made progress in the design of a new sensor to measure simultaneously the particle volume fraction near the wall and the normal force of impact from individual collisions. Finally, we have conducted additional simulations of the rapid granular flows of spheres interacting with a flat, frictional wall. The objective was to generate semi-empirical expressions for the boundary conditions imposed by the wall on the flow. DOE

A GRID REFINEMENT STUDY OF TWO-DIMENSIONAL TRANSIENT FLOW OVER A BACKWARD-FACING STEP USING A SPECTRAL-ELEMENT METHOD
J. R. Torczynski 1992 18 p Presented at the American Society of Mechanical Engineers (ASME) Fluids Engineering Conference, Washington, DC, 20-24 Jun. 1993
(Contract DE-AC04-76DP-00789)
(DE92-018262; SAND-92-1561C; CONF-930621-1) Avail: CASI HC A03/MF A01

The two-dimensional transient flow over a backward-facing step is numerically simulated using the spectral-element computational fluid dynamics code NEKTON. The simulated geometry corresponds to that of Kaiktsis et al. (1991) and Armaly et al. (1983), and flow is examined at Reynolds numbers of 500 and 800. A systematic grid refinement study is performed by varying both the element size and the order of the polynomial representation within the elements. For both values of the Reynolds number, it is observed that low-resolution cases exhibit sustained chaotic temporal behavior but that high-resolution cases evolve toward asymptotically steady flow by a monotonic decay of the transient. The resolution required to obtain asymptotically steady behavior is seen to increase with Reynolds number. These results suggest that the recently reported transition to chaotic flow at Reynolds numbers around 700 is an artifact of inadequate spatial resolution. The cause of resolution-dependent temporal behavior of spectral-element methods is explored. DOE

THE ONSET OF VORTEX TURBULENCE Ph.D. Thesis
G. Huber Dec. 1992 98 p
(Contract DE-AC03-76SF-00098)
(DE93-010424; LBL-33517) Avail: CASI HC A05/MF A02

The goal is to investigate some of the unusual and spectacular properties near the transition to turbulence in a two-dimensional field of limit-cycle oscillators. Of particular interest are the dynamics of topological defects (vortices) associated with the onset of turbulence. The complex Ginzburg-Landau equation describes an extended reaction-diffusion system close to the bifurcation of a steady state into a stable, periodic orbit. In the jargon of nonlinear dynamics, it is the amplitude equation corresponding to a Hopf bifurcation. Because of the generality of the assumptions under which it is derived, the complex Ginzburg-Landau equation describes systems in contexts other than chemical reactions with diffusion. Examples include Rayleigh-Benard convection and the phase fields of multimode lasers. The reaction-diffusion model is however, a sufficiently general model to frame our discussion. DOE

(Contract DRET-88-34-001)
(ONERA-RSF-23/1123-AY-230A; ONERA-RSF-23/1123-AY-232A; ETN-91-90083) Avail: CASI HC A03/MF A01

The progress made in developing a three dimensional Euler code for complex configurations of hypersonic and high supersonic flows is described. A multidomain method is studied on one hand in order to better obtain a grid, as well as develop implicit schemes. The industrial applications of the three dimensional code are discussed. For individual titles, see N93-28745 through N93-28745.

NUMERICAL SIMULATION OF PERFECT FLUID FLOWS AROUND COMPLEX 3D CONFIGURATIONS BY A MULTIDOMAIN SOLVER USING THE MUSCL APPROACH
Ph. Guillen, M. Borrel, and M. Dormieux (Aerospatiale, Chatillon, France.) *In its* Development of a 3-D Implicit Euler Code for Hypersonic and High Supersonic Flows Oct. 1990 p 33-44 (For primary document see N93-28744 11-34)
Avail: CASI HC A03/MF A01

A numerical scheme of the MUSCL type used for the numerical simulation of gas flow of different types around complex configurations is described. Approximate Riemann solvers of the Van Leer, Roc, and Osher types, developed for perfect gas flows are used. These solvers have been extended to non-reactive mixtures of two species and real gas flows by Abgrall, Montagne and Vinokur. The architecture of the code, dictated by constraints in geometrical considerations, computational aspects, the specific nature of the flow, and ergonomy, is described. ESA

MACROSTATISTICAL HYDRODYNAMICS
H. Brenner 1993 15 p
(Contract DE-FG02-88ER-13896)
(DE93-012289; DOE/ER-13896/5) Avail: CASI HC A03/MF A01

This research aims to correlate the macroscopic rheological behavior of suspensions with their statistical microstructure. This fundamental knowledge will benefit a host of technologies, including geothermal energy production, petroleum production and refining, and synfuels processing. The approach involves a novel combination of experiments, numerics, and theory. Experiments primarily involve tracking small balls as they fall slowly through otherwise quiescent suspensions of neutrally buoyant particles. Detailed trajectories of the balls, obtained either with new experimental techniques or by numerical simulation, are statistically interpreted in terms of the mean settling velocity and the dispersion about the mean. Determining the mean settling velocity of balls that are small relative to the suspended particles is a means of measuring the macroscopic zero-shear-rate viscosity without significantly disturbing the original microstructure; therefore, falling-ball rheometry is a powerful tool for use in studying the effects of microstructure on the macroscopic properties of suspensions. The dispersion about the mean yields information about the particle interactions. To date, the mean and dispersivity of a falling sphere's velocity has been determined as a function of the tracer sphere size and the suspended particle size, shape, and concentration. Currently, the pressure drop caused by the falling ball is also being measured. This will provide a much needed benchmark problem for numerical studies, as well as provide another measure of the macroscopic response of a suspension as a function of its microstructure. Also begun recently are two studies of boundary effects in two-phase fluids: the determination of the torque on a small ball spinning in a suspension, and the determination of the velocity of a small ball rolling down the wall of a container holding a suspension. THE DEVELOPMENT OF A MIXING LAYER UNDER THE ACTION OF WEAK STREAMWISE VORTICES
Marvin E. Goldstein and Joseph Mathew Mar. 1993 36 p
(Contract NCC3-233; RTOP 505-62-21)
(NASA-TM-106089; E-7724; NAS 1.15:106089; ICOMP-93-9) Avail: CASI HC A03/MF A01

The action of weak, streamwise vortices on a plane, incompressible, steady mixing layer is examined in the large Reynolds-number limit. The outer, inviscid region is bounded by a vortex sheet to which the viscous region is confined. It is shown that the local linear analysis becomes invalid at streamwise distances O(epsilon(sup -1)), where epsilon is much less than 1 is the cross flow amplitude, and a new nonlinear analysis is constructed for this region. Numerical solutions of the nonlinear problem show that the vortex sheet undergoes an O(1) change in position and that the solution is ultimately terminated by the appearance of a singularity. The corresponding viscous layer shows downstream thickening, but appears to remain well behaved up to the singular location. Author (revised)

SOME ASPECTS OF THE AEROACOUSTICS OF HIGH-SPEED JETS Final Report
James Lighthill (University Coll., London, England.) Washington May 1993 47 p Submitted for publication
(Contract NAS1-19480; RTOP 50-90-52-01)
(NASA-CR-191458; NAS 1.26:191458; ICASE-93-20) Avail: CASI HC A03/MF A01

Some of the background to contemporary jet aeroacoustics is addressed. Then scaling laws for noise generation by low-Mach-number airflows and by turbulence convected at 'not so low' Mach number is reviewed. These laws take into account the influence of Doppler effects associated with the convection of aeroacoustic sources. Next, a uniformly valid Doppler-effect approximation exhibits the transition, with increasing Mach number of convection, from compact-source radiation at low Mach numbers to a statistical assemblage of conical shock waves radiated by eddies convected at supersonic speed. In jets, for example, supersonic eddy convection is typically found for jet exit speeds exceeding twice the atmospheric speed of sound. The Lecture continues by describing a new dynamical theory of the nonlinear propagation of such statistically random assemblages of conical shock waves. It is shown, both by a general theoretical analysis and by an illustrative computational study, how their propagation is dominated by a characteristic 'bunching' process. That process associated with a tendency for shock waves that have already formed unions with other shock waves to acquire an increased proneness to form further unions - acts so as to enhance the high-frequency part of the spectrum of noise emission from jets at these high exit speeds. INVISCID QUASI ONE-DIMENSIONAL NONEQUILIBRIUM FLOW
Tor Arne Gronland 23 Nov. 1992 44 p
(Proj. AE-4051)
(FFA-TN-1992-35) Avail: CASI HC A03/MF A01

This work deals with numerical methods for nozzle flow in the quasi one-dimensional approximation. A point implicit scheme is used as a remedy to the numerical difficulties arising from the stiff equation system of nonequilibrium flow. The gas considered is air in thermal and chemical nonequilibrium. Two different chemistry models are used. One follows the Park formulation and another the Dunn & Kang formulation. Both using a 5 species, 17 reactions, air model. Boundary conditions are critical for internal flows. An accurate formulation by the method of characteristics is given. By setting a subsonic outflow condition for a choked flow, a stationary shock is captured inside the nozzle. The work performed is tested and implemented in a quasi one-dimensional Euler code, NOZWS. IMPLEMENTATION OF A MULTIDOMAIN NAVIER-STOKES CODE ON THE INTEL iPSC2 HYPERCUBE
Peter Eliasson, Ingemar Lindblad, and Per Wahlund 18 Nov. 1992 19 p
(Contract NUTEK-90-02278P; Proj. AU-4093)
(FFA-TN-1992-37) Avail: CASI HC A03/MF A01

This report describes the implementation of a multidomain/multigrid 3D Navier-Stokes code on a parallel computer, namely the Intel iPSC2 hypercube. The sequential flow code was the EURANUS code, developed at VUB, Brussels and FFA, Stockholm. In addition to the Navier-Stokes and multigrid algorithms, this code is characterized by a software-engineering-based coding approach to produce a structured and flexible program. It has a dynamic memory handling to facilitate the storage and maintenance of multiple domains of different sizes. The data structure supports more than one (super)computer architecture and facilitates parallel processing. Multidomain calculations are handled in the code in a flexible manner which can be used on MIMD type computers as well as supercomputers. The host-node program structure and explicit send-receive routines for data exchange between domains on the hypercube meant that the start-up of the code and the handling of external files had to undergo the largest changes. The code was tested on a realistic hypersonic problem, a delta wing at Mach 10. This is a one domain problem, to run it parallel the domain was split up into several smaller equally sized domains. The domains were then distributed to the nodes, one domain per node. Due to the small memory of the machine (4 Mbytes/nodes) rather small problems fit into the memory. Two different cases were run using 1 to 16 nodes (domains). The results revealed that the overhead from the data structure and boundary conditions is rather high. This indicates that the subdivided domains are too small for good efficiency. High speedups require larger cases and machines with much larger memory. Author (revised)

AN EFFICIENT SPECTRAL INTEGRATION METHOD FOR THE SOLUTION OF THE NAVIER-STOKES EQUATIONS

Anders Lundbladh, Dan S. Henningson, and Arne V. Johansson (Royal Inst. of Tech., Stockholm, Sweden.) 30 Nov. 1992 53 p
(Contract NUTEK-5622-92-04537; Proj. AU-4109)
(FFA-TN-1992-28) Avail: CASI HC A04/MF A01

An efficient spectral integration technique for the solution of the incompressible Navier-Stokes equations in the channel flow geometry is described and implemented in a computer code using the FORTRAN language. The horizontal directions are discretized using Chebyshev series. Time integration is done using second order Adams-Bashforth or third order Runge-Kutta methods for the non-linear terms and Crank-Nicholson for the viscous terms. The computer code is available using electronic mail. Author

NONLINEAR STABILITY OF VISCOUS SHOCK WAVES

Anders Szepessy and Zhouping Xin 1990 63 p
(Contract DE-FG02-88ER-25053; NSF DMS-90-02286)
(TRITA-NA-9205) Avail: CASI HC A04/MF A01

The large time asymptotic stability of solutions for systems of nonlinear viscous conservation laws are studied. Systems which are strictly hyperbolic and either genuinely nonlinear or linear degenerate in each characteristic field are addressed. Such systems possess a smooth travelling wave solution, which is called a viscous p-shock wave solution, provided that the shock strength epsilon is equivalent to the absolute value of the sum of u(sub +) - u(sub -) is small, the constant states u(sub +/-) and the wave speed sigma are related by the Rankine-Hugoniot condition and the Lax entropy condition. STATE VECTOR SPLITTING: A NUMERICAL SCHEME FOR THE EULER EQUATIONS Ph.D. Thesis

Hakan Oksuzoglu 1993 70 p
Avail: Univ. Microfilms Order No. DA9309644

A new numerical scheme was developed for the solution of the Euler equations in multi-dimensions. The scheme removes the critical dependency on the choice of a 'good' grid by making use of the multidimensional character of the Euler Equations. In addition, a new procedure for implementing solid wall boundary conditions was introduced which does not require body-fitted grids. This grid independent nature of the scheme allows one to solve complicated geometry problems on simple regular grids. The scheme uses an upwind direction which is independent of the underlying coordinate system. This direction is determined only by the local state of the fluid. The scheme is explicit and easy to implement for both serial and parallel computation. The current implementation of the algorithm for two space dimensions can handle unsteady flows around almost arbitrary geometries using a simple cartesian mesh. Several numerical experiments were done to show the flexibility and the robustness of the algorithm. Dissert. Abstr.

STABILIZED SPACE-TIME FINITE ELEMENT FORMULATIONS FOR UNSTEADY INCOMPRESSIBLE FLOWS INVOLVING FLUID-BODY INTERACTIONS Ph.D. Thesis

Sanjay Mittal 1992 177 p
Avail: Univ. Microfilms Order No. DA9308739

Stabilized space-time finite element formulations are presented for unsteady incompressible flows involving fluid-body interactions. A detailed numerical investigation is carried out for flows past an elastically mounted cylinder. The non-linear coupling between the flow field and the motion of the cylinder leads to interesting phenomena like 'hysteresis' and 'lock-in'. Flows past a horizontally oscillating cylinder and a pitching airfoil are also studied. The method is also applied to compute the dynamics of a freely falling airfoil and a projectile that has certain initial velocity. In all these computations, smart mesh moving schemes are used that minimize the projection errors and increase the parallelization potential. The formulations are used to study laminar flow past a fixed airfoil at high Reynolds numbers. Preliminary results are presented for a three-dimensional simulation that involves time-dependent Taylor instabilities in Couette flow. Efficient iteration techniques are employed to solve the equation systems resulting from the finite element discretizations of these large-scale problems. A large fraction of these computations are carried out on massively parallel supercomputers. Dissert. Abstr.

LARGE EDDY SIMULATIONS OF SHOCKWAVE PASSAGE THROUGH TURBULENCE

A. C. Buckingham Jul. 1992 16 p Presented at the American Society of Mechanical Engineers (ASME) Fluids Engineering Conference, Washington, DC, 20-24 Jun. 1993
(Contract W-7405-eng-48)
(DE92-019503; UCRL-JC-111080; CONF-930621) Avail: CASI HC A03/MF A01

This is a discussion of progress in continuing efforts to understand and predict the influence of shock waves on turbulent fields during shock-turbulence interactions. Observations show that the Reynolds stress tensor magnitude increases. Strong support for tensor amplification is supplied by the sharply distorted strain field localized to the immediate neighborhood of the shock surface. Beyond this there develops a gradual decay to a new more modestly amplified state relative to the pre-shocked level. Practical interest centers on the significantly altered, albeit shock localized, values of post-shock turbulent kinetic energy, transport, component mixing, wall shear, and heat transfer. The first phase makes use of a direct two dimensional Monte Carlo simulation procedure to examine the influence of upstream turbulence on shock structure and front topography. Linear viscoelastic turbulence response parameters are developed to model the interaction. In the post-shock region, compressible two dimensional large eddy simulations (LES) are applied. Initially a compressibility modified Smagorinsky model with random subgrid scale backscatter is adopted for the non-resolved scales. Favre averaged conservation equations apply to the explicitly resolved scales. Predicted amplification levels, modal energy partition, shock translational to turbulence kinetic energy transfer, and viscoelastic response of turbulence to shock interaction are examined in comparison with available experimental evidence. Recent developments in two-band dynamic eddy viscosity modeling for the subgrid scales are then examined for improvement of the results of the LES in the near wall region, under the influence of stochastic subgrid scale backscatter, and in the neighborhood of the shock. DIRECT NUMERICAL SIMULATIONS OF UNSTEADY SEPARATED FLOWS USING VORTEX METHODS Ph.D. Thesis

Petros D. Koumoutsakos 1993 184 p
Avail: Univ. Microfilms Order No. DA9307040

Numerical simulations are presented for viscous incompressible flows with and without solid wall boundaries. Our numerical method is based on vortex methods. The classical inviscid scheme is enhanced to account for viscous effects via the method of particle strength exchange. The method is extended to account for the enforcement of the no-slip boundary condition as well by appropriately modifying the strength of the particles. Computations are possible for extended times by periodically remeshing the vorticity field. The particles are advanced using the Biot-Savart law for the evaluation of the velocity. Computations are made using up to O(10(exp 6)) vortex particles by efficiently implementing the method of multipole expansions for vector computer architectures to obtain an O(N) algorithm. The method is used to simulate the inviscid evolution of an elliptical vortex in an unbounded fluid as well as unsteady separated flows around circular cylinders for a wide range of Reynolds numbers (40-9500). Direct comparisons are made of the results of the present method with those from a variety of theoretical, computational, and experimental studies. The results exhibit the robustness and validity of the present method and allow to gain physical insight as to vorticity formation and its relation to the forces experienced by the body. Dissert. Abstr.

A FOUR-FIELD APPROACH TOWARDS DEVELOPING A MECHANISTIC MODEL FOR MULTIPHASE FLOW

J. M. Kelly 1993 35 p Sponsored by DOE

(DE93-006572; PNL-SA-18878) Avail: CASI HC A03/MF A01

A four-field model has been developed to provide a more mechanistic treatment of multiphase flow. In a gas/liquid system, the four-field approach considers two continuous (liquid and vapor) and two discrete (bubbles and drops) fields. Modeling each phase as a combination of two forms, each with a distinct interface geometry and velocity field, provides a more physically realistic framework for two-phase flow analysis than the commonly used two-fluid model. The four-field model and first-generation constitutive models are described. Simulations of air/water bubble coalescence tests are presented and correlation deficiencies noted. Further efforts to develop mechanistic models for the processes that create or destroy interfacial area are planned as part of this program. DOE

THE THREE-DIMENSIONAL MULTI-BLOCK ADVANCED GRID GENERATION SYSTEM (3DMAGGS)

Stephen J. Alter (Lockheed Engineering and Sciences Co., Hampton, VA.) and Kenneth J. Weilmuenster May 1993 73 p

(RTOP 506-40-91-02)

(NASA-TM-108985; NAS 1.15:108985) Avail: CASI HC A04/MF A01

As the size and complexity of three dimensional volume grids increases, there is a growing need for fast and efficient 3D volumetric elliptic grid solvers. Present day solvers are limited by computational speed and do not have all the capabilities such as interior volume grid clustering control, viscous grid clustering at the wall of a configuration, truncation error limiters, and convergence optimization residing in one code. A new volume grid generator, 3DMAGGS (Three-Dimensional Multi-Block Advanced Grid Generation System), which is based on the 3DGRAPE code, has evolved to meet these needs. This is a manual for the usage of 3DMAGGS and contains five sections, including the motivations and usage, a GRIDGEN interface, a grid quality analysis tool, a sample case for verifying correct operation of the code, and a comparison to both 3DGRAPE and GRIDGEN3D. Since it was derived from 3DGRAPE, this technical memorandum should be used in conjunction with the 3DGRAPE manual (NASA TM-102224). Author (revised)

HIGH REYNOLDS NUMBER AND TURBULENCE EFFECTS ON AERODYNAMICS AND HEAT TRANSFER IN A TURBINE CASCADE

Frederick C. Yeh, Steven A. Hippensteele, G. James VanFossen, Philip E. Poinsatte, and Ali Ameri (Kansas Univ. Center for Research, Inc., Lawrence.) Jun. 1993 17 p Presented at the 29th Joint Propulsion Conference and Exhibit, Monterey, CA, 28-30 Jun. 1993; cosponsored by AIAA, SAE, ASME, and ASEE

(RTOP 505-62-52)

(NASA-TM-106187; E-7791; NAS 1.15:106187; AIAA Paper 93-2252)

Avail: CASI HC A03/MF A01

Experimental data on pressure distribution and heat transfer on a turbine airfoil were obtained over a range of Reynolds numbers from 0.75 to 7.5 x 10 exp 6 and a range of turbulence intensities from 1.8 to about 15 percent. The purpose of this study was to obtain fundamental heat transfer and pressure distribution data over a wide range of high Reynolds numbers and to extend the heat transfer data base to include the range of Reynolds numbers encountered in the Space Shuttle main engine (SSME) turbopump turbines. Specifically, the study aimed to determine (1) the effect of Reynolds number on heat transfer, (2) the effect of upstream turbulence on heat transfer and pressure distribution, and (3) the relationship between heat transfer at high Reynolds numbers and the current data base. The results of this study indicated that Reynolds number and turbulence intensity have a large effect on both the transition from laminar to turbulent flow and the resulting heat transfer. For a given turbulence intensity, heat transfer for all Reynolds numbers at the leading edge can be correlated with the Frossling number developed for lower Reynolds numbers. For a given turbulence intensity, heat transfer for the airfoil surfaces downstream of the leading edge can be approximately correlated with a dimensionless parameter. Comparison of the experimental results were also made with a numerical solution from a two-dimensional Navier-Stokes code. Author (revised)

SUPERSONIC FLOW CALCULATION USING A REYNOLDS-STRESS AND AN EDDY THERMAL DIFFUSIVITY TURBULENCE MODEL

T. P. Sommer, R. M. C. So, and H. S. Zhang Washington Jun. 1993 38 p

(Grant NAG1-1080; RTOP 505-70-59-08)

(NASA-CR-4515; NAS 1.26:4515) Avail: CASI HC A03/MF A01

A second-order model for the velocity field and a two-equation model for the temperature field are used to calculate supersonic boundary layers assuming negligible real gas effects. The modeled equations are formulated on the basis of an incompressible assumption and then extended to supersonic flows by invoking Morkovin's hypothesis, which proposes that compressibility effects are completely accounted for by mean density variations alone. In order to calculate the near-wall flow accurately, correction functions are proposed to render the modeled equations asymptotically consistent with the behavior of the exact equations near a wall and, at the same time, display the proper dependence on the molecular Prandtl number. Thus formulated, the near-wall second order turbulence model for heat transfer is applicable to supersonic flows with different Prandtl numbers. The model is validated against flows with different Prandtl numbers and supersonic flows with free-stream Mach numbers as high as 10 and wall temperature ratios as low as 0.3. Among the flow cases considered, the momentum thickness Reynolds number varies from approximately 4,000 to approximately 21,000. Good correlation with measurements of mean velocity, temperature, and its variance is obtained. Discernible improvements in the law-of-the-wall are observed, especially in the range where the big-law applies. Author (revised)

A NUMERICAL STUDY OF CONFINED TURBULENT JETS

J. Zhu and T.-H. Shih Jun. 1993 27 p Prepared for the Winter Annual Meeting, New Orleans, LA, 28 Nov. - 3 Dec. 1993; sponsored by ASME

(RTOP 505-90-5K)

(NASA-TM-106197; E-7906; NAS 1.26:106197; ICOMP-93-18; CMOTT-93-07) Avail: CASI HC A03/MF A01

A numerical investigation is reported of turbulent incompressible jets confined in two ducts, one cylindrical and the other conical with a 5 degree divergence. In each case, three Craya-Curtet numbers are considered which correspond, respectively, to flow situations with no moderate and strong recirculation. Turbulence closure is achieved by using the k-epsilon model and a recently proposed realizable Reynolds stress algebraic equation model that relates the Reynolds stresses explicitly to the quadratic terms of the mean velocity gradients and ensures the positiveness of each component of the turbulent kinetic energy. Calculations are carried out with a finite-volume procedure using boundary-fitted curvilinear coordinates. A second-order accurate, bounded convection scheme and sufficiently fine grids are used to prevent the solutions from being contaminated by numerical diffusion. The calculated results are compared extensively with the available experimental data. It is shown that the numerical methods presented are capable of capturing the essential flow features observed in the experiments and that the realizable Reynolds stress algebraic equation model performs much better than the k-epsilon model for this class of flows of great practical importance. NONLINEAR RELAXATION ALGORITHMS FOR THE COMPRESSIBLE NAVIER-STOKES EQUATIONS IN TWO AND THREE DIMENSIONS Ph.D. Thesis
Jack Ray Edwards 1993 158 p
Avail: Univ. Microfilms Order No. DA9309786

An efficient new class of implicit algorithms for the computation of steady, two- and three-dimensional, compressible Navier-Stokes flow fields is presented. A nonlinear relaxation strategy based on a fully coupled sequence of line or planar Gauss-Seidel sweeps is used to drive the solution toward a steady state. Quasi-Newton techniques are used to accelerate the convergence of the 2-D algorithm and to reduce approximate factorization errors in the 3-D version. Convergence characteristics are further improved through the addition of a coarse-grid correction procedure. The discretization of the Navier-Stokes set is hybrid in nature, with flux-vector splitting utilized for the streamwise inviscid fluxes and central differences with flux-limited artificial dissipation used for the transverse inviscid fluxes. Viscous fluxes are central-differenced. Both laminar and turbulent cases are considered, with turbulent closure provided by a modification of the Baldwin-Barth one-equation model. Convergence histories and comparisons with experimental data are presented for several 2-D and 3-D shock wave-boundary layer interactions. Several numerical simulations of the Mach 10 flow through a generic 3-D sidewall compression scramJet inlet configuration are also presented. For the medium-sized (175,000-325,000 mesh points) 3-D validation cases, the algorithm provides steady-state convergence in 15 to 17 Cray Y-MP CPU minutes. Converged solutions for some of the inlet flow fields (375,000-395,000 mesh points) are obtained in about one CPU hour. Dissert. Abstr.

Recently there has been substantial interest in least-squares finite element methods for velocity-vorticity-pressure formulations of the incompressible Navier-Stokes equations. The main cause for this interest is the fact that algorithms for the resulting discrete equations can be devised which require the solution of only symmetric, positive definite systems of algebraic equations. On the other hand, it is well-documented that methods using the vorticity as a primary variable often yield very poor approximations. Thus, here we study the accuracy of these methods through a series of computational experiments, and also comment on theoretical error estimates. It is found, despite the failure of standard methods for deriving error estimates, that computational evidence suggests that these methods are, at the least, nearly optimally accurate. Thus, in addition to the desirable matrix properties yielded by least-squares methods, one also obtains accurate approximations. Author (revised)

DEVELOPMENT OF AN UNSTRUCTURED SOLUTION ADAPTIVE METHOD FOR THE QUASI-THREE-DIMENSIONAL EULER AND NAVIER-STOKES EQUATIONS Final Report, 2 Jan. 1990 - 31 Aug. 1993
Yi-Tsann Jiang and William J. Usab, Jr. 31 Aug. 1993 269 p
(Grant NAG3-1127)
(NASA-CR-193241; NAS 1.26:193241) Avail: CASI HC A12/MF A03

A general solution adaptive scheme based on a remeshing technique is developed for solving the two-dimensional and quasi-three-dimensional Euler and Favre-averaged Navier-Stokes equations. The numerical scheme is formulated on an unstructured triangular mesh utilizing an edge-based pointer system which defines the edge connectivity of the mesh structure. Jameson's four-stage hybrid Runge-Kutta scheme is used to march the solution in time. The convergence rate is enhanced through the use of local time stepping and implicit residual averaging. As the solution evolves, the mesh is regenerated adaptively using flow field information. Mesh adaptation parameters are evaluated such that an estimated local numerical error is equally distributed over the whole domain. For inviscid flows, the present approach generates a complete unstructured triangular mesh using the advancing front method. For turbulent flows, the approach combines a local highly stretched structured triangular mesh in the boundary layer region with an unstructured mesh in the remaining regions to efficiently resolve the important flow features. One-equation and two-equation turbulence models are incorporated into the present unstructured approach. Results are presented for a wide range of flow problems including two-dimensional multi-element airfoils, two-dimensional cascades, and quasi-three-dimensional cascades. This approach is shown to gain flow resolution in the refined regions while achieving a great reduction in the computational effort and storage requirements since solution points are not wasted in regions where they are not required. We have discovered a remarkable set of flow patterns induced by shock acceleration of two nearby, perturbed interfaces. Using planar laser-induced fluorescence (PLIF), we observe three distinct patterns in the nonlinear evolution of Richtmyer-Meshkov (RM) instabilities associated with this flow. We observe two patterns dominated by vortex pairs and one pattern showing no vortex pairing (until late time) for initial conditions that are indistinguishable by measurement techniques available for our work. The flow is initiated by spatially periodic perturbations imposed on a 'gas curtain' interacting with a planar shock wave. These flow patterns are not predictable nor controllable in our experiments. Our measurements appear to be the first observations of a shock-driven flow exhibiting characteristics of bifurcation. Results were recently published, and more detailed results are forthcoming. We present here a brief description of the experiment, summary of results, and a vortex-based explanation of the phenomena. DOE

NUMERICAL COMPUTATION OF INVISCID FLOW AROUND NOSE TIP OF SPACE SHUTTLE WITH NND SCHEME
Ye Youda and Guo Zhiquan 27 Apr. 1993 18 p Transl. into ENGLISH from unidentified document (China) p 282-290
(AD-A264012; FASTC-ID(RS)T-0867-92) Avail: CASI HC A03/MF A01

The NND scheme presented by Professor Zhang Hanxin of the CARDC has been used in this paper to complete the following computations: the two-dimensional inviscid flow around the symmetric plane of the nose tip of the space shuttle; the three-dimensional inviscid flow around the nose tip of the space shuttle; and the three dimensional inviscid flow around the axisymmetric indented body. Under the general coordinate system, the computation grids have been generated by algebra equations. The characteristic compatibility equations have been used to treat the shock and body surface boundaries, and there is a special treatment in translation of the coordinate system. Finally, the comparative computations have been completed using second order SCM schemes. The results of computation illustrate that the NND scheme used in this paper can avoid numerical oscillations and high resolution to shock-capturing. DTIC

FLOW VISUALIZATION ON HELICOPTER BLADES USING ACENAPHTHEN
Claas-Hinrik Rohardt (Deutsche Forschungsanstalt fuer Luft- und Raumfahrt, Brunswick, Germany.) Nov. 1992 41 p Transl. into ENGLISH of Stroemungssichtbarmachung an Hubschrauberrotorblaettern Mittels Acenaphthen (Brunswick, Germany, DLR) Jul. 1990 p 1-42 Original language document was announced as N91-21466
(ESA-TT-1255; DLR-FB-90-37; ETN-93-93712) Avail: CASI HC A03/MF A01; Original German version available from DLR, Wissenschaftliches Berichtswesen, VB-PL-DO, Postfach 90 60 58, 5000 Cologne, Germany, HC

Results of visualization of boundary layer characteristics on a helicopter blade under practical conditions are described. The acenaphthene visualization method was used. It was found to be effective in ascertaining the laminar turbulent transition point. The results confirm the design philosophy of generating the longest possible laminar paths in order to minimize skin friction drag. Despite some inadequacy of surface quality (especially in the front area of the blade), there are prolonged laminar boundary layer paths in the hover. It is nonetheless found that aerofoil disturbances, such as those arising due to the anti-erosion strip, should be avoided. Likewise, regular cleaning of the rotor blades to remove insect residues is important in order to maintain high aerofoil performance levels. Calculations with a two dimensional method tended to indicate satisfactory consistency with transition points obtained by experimental means. ESA

THE MICROCHANNEL HEATSINK WITH LIQUID NITROGEN COOLING
R. A. Riddle and A. F. Bernhardt Jun. 1992 11 p Presented at the Society of Photo-Optical Instrumentation Engineers (SPIE) International Symposium on Optical Applied Science and Engineering, San Diego, CA, 19-24 Jul. 1992
(Contract W-7405-eng-48)
(DE93-009258; UCRL-JC-109267; CONF-920792-49) Avail: CASI HC A03/MF A01

Excellent thermal performance of a silicon microchannel heatsink is demonstrated using liquid nitrogen as the coolant over a wide range of heat loads up to 1 kW/sq cm. This performance is partly due to the order of magnitude increase in the thermal conductivity of silicon near 77 K compared to room temperature. Subcooled boiling of the liquid nitrogen in the microchannel heatsink further enhances the thermal performance but makes the thermal resistance a nonlinear function of heat load. For a 500 W/sq cm heat load, a thermal resistances of 0.052 sq cm C/W for a 9:1 aspect ratio heatsink was measured. DOE

NON-LINEAR WAVE PHENOMENA IN A GAS-VAPOUR MIXTURE WITH PHASE TRANSITION Ph.D. Thesis
Hubertus Josephus Smolders 1992 191 p
(ETN-93-93582) Avail: CASI HC A09/MF A02

An experimental and theoretical investigation of two types of gasdynamic flow with phase transition is reported. The flow phenomena studied are: the unsteady nonlinear rarefaction wave in a gas-vapor mixture with stimulated condensation on foreign particles added to the mixture; and the shock wave in a fog, which causes the evaporation of droplets that are presented. The structure of these types of waves, influenced by the phase transitions processs, was investigated and the validity of models to describe droplet formation and growth was established. ESA

EVOLUTION OF FLOW DISTURBANCES IN COCURRENT GAS-LIQUID FLOWS
M. J. McCready Oct. 1992 19 p
(Contract DE-FG02-88ER-13913)
(DE93-010083; DOE/ER-13913/5) Avail: CASI HC A03/MF A01

Studies of interfacial waves in horizontal gas-liquid flows, close to neutral stability, suggest that the rate of evolution of the interface may be linked to nonlinear interactions between the fundamental mode and the subharmonic -- even if the subharmonic is linearly stable. The rate of evolution increases as the subharmonic becomes more unstable. A comparison of linear stability techniques used to predict the initial behavior of waves reveals similar predictions of growth rates and almost identical speeds between a two layer laminar Orr-Sommerfeld theory and an Orr-Sommerfeld theory when the effect of the (turbulent) gas flow enters as boundary conditions on the liquid layer. However, there is disagreement at small wavenumbers as to the point at which the growth curve crosses 0. This is a significant problem because longwave disturbances, in our case roll waves, form by growth of (initially) small amplitude waves that have frequencies which are 0.5 to 1 Hz, which is in the range where the two theories disagree about the sign of the growth rate. While nonlinear effects are probably involved in the formation of the peak (at least while its amplitude is small), the linear growth rate must play an important role when the amplitude is small. (DE93-009865; DOE/ER-61173/T1) Avail: CASI HC A05/MF A01

In 1988, Nielsen started work to measure the spatial variability of the mass flux vector being transported in a porous medium. To measure the spatial variability of the mass flux vector, the spatial variability of its components (velocity, concentration) must be measured. Nielsen was successful in measuring the pore level concentration at many different pores and in verifying the assumption that a nonuniform concentration field exists within the mixing zone between two miscible fluids. However, Nielsen was unable to conduct the necessary pore level velocity measurements needed. Nielsen's work is being continued and a probe is being developed that will measure both velocity and concentration components at pore level. The probe is essentially the same probe used to make the pore level concentration measurements with added capabilities needed to make the velocity measurements. This probe has several design variables, dealing primarily with the velocity component, that need further investigation. The research presented in this thesis investigates these parameters by performing experiments in a capillary tube. The tube is a controlled system where the velocity of the fluid can be determined from the volumetric flow rate using Poiseuille's solution for viscous flow. Also, a statistically based relationship between the velocity measured with the probe and the velocity determined from the volumetric flow rate has been developed. DOE

This report presents the description of a liquid sodium heat transfer facility (sodium loop) constructed to support the study of transient response of heat pipes. The facility, consisting of the loop itself, a safety system, and a data acquisition system, can be safely operated over a wide range of temperature and sodium flow rate. The transient response of a heat pipe to pulse heat load at the condenser section was experimentally investigated. A 0.457 m screen wick, sodium heat pipe with an outer diameter of 0.127 m was tested under different heat loading conditions. A major finding was that the heat pipe reversed under a pulse heat load applied at the condenser. The time of reversal was approximately 15 to 25 seconds. The startup of the heat pipe from frozen state was also studied. It was found that during the startup process, at least part of the heat pipe was active. The active region extended gradually down to the end of the condenser until all of the working fluid in the heat pipe was molten. DTIC

A novel design of a high-temperature axially grooved heat pipe (HP), which utilizes thermal energy storage (TES) to mitigate pulse heat loads, was presented. Phase-change material (PCM) encapsulated in cylindrical containers was used for thermal energy storage. The transient responses of the HP/TES system under two types of pulse heat loads were studied numerically. The first type is pulse heat loads applied at the heat pipe evaporator; the second type is reversed-pulse heat loads applied at the condenser. The transient response of three different HP/TES configurations were compared: (1) a heat pipe with a large empty cylinder installed in the vapor core, (2) a heat pipe with a large PCM cylinder, and (3) a heat pipe with six small PCM cylinders. It was found that the PCM is very effective in mitigating the adverse effect of pulse heat loads. The six small PCM cylinders are more efficient than the large PCM cylinder in relaxing the heat pipe temperature increase under pulse heat loads. DTIC

This report presents an experimental and theoretical investigation of spray cooling. A complete study is presented for surfaces maintained between the fluid saturation temperature and the Leidenfrost temperature. Experiments were conducted to analyze the effects of spray and surface conditions on the heat transfer. Different mechanisms causing the critical heat flux (CHF) are identified. For dropwise evaporation, CHF results when the surface heat flux exceeds the latent heat content of the spray. As the flow rate is increased, droplet conglomeration and surface flooding result. For low flow rate cases with a flooded surface, CHF is caused by a liquid deficiency resulting from droplet expulsion caused by the nucleating bubbles within the liquid film. For higher flow rate cases, CHF occurs when the vapor generation rate on the surface is so high that a vapor barrier is formed. DTIC

METHODS FOR REDUCING TURBULENT FLOW AERO-OPTICAL DISTORTION Final Report, 1 Jun. 1992 - 30 Jun. 1993
Robert E. Childs 31 Mar. 1993 47 p
(Contract DAAL03-92-C-0015)
(AD-A263698; NEAR-TR-460; ARO-30431.1-EG-SBI) Avail: CASI HC A03/MF A01

Methods for reducing the aero-optical distortion which affects jet-cooled seeker windows on high-speed, endo-atmospheric interceptors were studied. Reductions in turbulence were achieved by curving the shear layer in the streamwise direction. This type of curvature corresponds to a window whose outer surface is convex in the axial direction. For a case with moderate curvature, the peak shear stress and density fluctuations were reduced by 85% compared to an otherwise similar flat shear layer. The optical properties of the shear layers were evaluated using a simple ray-tracing method, and the aero-optical distortion was significantly reduced by the stabilizing curvature. Another control concept that was tested involved lateral convergence imposed upon the shear layer. This concept was unsuccessful from an aero-optics view point because the turbulent shear stress roughly doubled relative to the unmodified shear layer. DTIC

MITIGATION OF SHOCK WAVES IN A CYLINDRICAL TUNNEL BY FOAM M.S. Thesis
Grant W. Fondaw Mar. 1993 115 p
(AD-A262491; AFIT/GNE/ENP/93M-2) Avail: CASI HC A06/MF A02

The effectiveness of foam linings in mitigating shock waves in tunnels is investigated. A polyurethane foam liner of varying density, crush strength, and thickness was modeled inside a 1 meter radius tunnel and an explosion of 1.25 kg of plastic explosive was simulated. Using CTH, an Eulerian-Lagrangian hydrodynamics code from Sandia National Laboratories, the overpressures were computed and compared graphically to determine the effect of varying each foam parameter. The walls of the tunnel consisted of a perfectly reflecting boundary, and in some cases, a foam liner. Low density foam provided the most shock attenuation, with a 20 cm thick layer of 90% void 0.1265 g/cm(sup 3) foam reducing the shock overpressure by 70% at 50 meters. The effects of foam thickness on the shock pressure varied with the distance from the explosion. The thicker foams raised the initial pressure near the explosion due to constriction of the tunnel area. However, the thicker layers reduced the shock faster. Varying the crush strength of the foam from 1 atm to 3 atm overpressure did not affect its ability to mitigate shock propagation in the tunnel. The results strongly suggest that foam can mitigate shock waves significantly. DTIC

THE EFFECT OF HIGH TEMPERATURE ON WALL SHEAR IN A TWO DIMENSIONAL WALL JET Final Report, 1 Oct 1991 - 21 Oct. 1992
M. A. Narayanan and Richard B. Rivir Oct. 1992 61 p
(AD-A262982; WL-TR-92-2091) Avail: CASI HC A04/MF A01

The effect of turbulence on skin friction was examined in the developing stage of a high Reynolds number wall jet. Skin friction was computed from the law of the wall measurements of mean velocity profiles in the sublayer. It was observed that constant 'A' in the law of the wall relation U/U* = A log YU*/upsilon + B was a universal one equal to 5.6 while 'B' was linearly dependent on the turbulence intensity near the wall. The wall shear was not significantly altered from that of an ordinary flat plate turbulent boundary layer even at high turbulence levels. The decay of the mean velocity in the longitudinal direction was found to be independent of the momentum flux of the jet at the nozzle exit. DTIC

AN UPWIND METHOD FOR THE SOLUTION OF THE 3D EULER AND NAVIER-STOKES EQUATIONS ON ADAPTIVELY REFINED MESHES Final Report, Mar. 1991 - Jun. 1992
Michael J. Aftosmis 17 Oct. 1992 49 p
(AD-A262863; WL-TR-92-3107) Avail: CASI HC A03/MF A01

A new node based upwind scheme for the solution of the 3D Navier-Stokes equations on adaptively refined meshes is presented. The method uses a second-order upwind TVD scheme to integrate the convective terms, and discretizes the viscous terms with a new compact central difference technique. Grid adaptation is achieved through directional division of hexahedral cells in response to evolving features as the solution converges. The method is advanced in time with a multistage Runge-Kutta time stepping scheme. Two- and three-dimensional examples establish the accuracy of the inviscid and viscous discretization. These investigations highlight the ability of the method to produce crisp shocks, while accurately and economically resolving viscous layers. The representation of these and other structures is shown to be comparable to that obtained by structured methods. Further 3D examples demonstrate the ability of the adaptive algorithm to effectively locate and resolve multiple scale features in complex 3D flows with many interacting, viscous, and inviscid structures. VERTICAL SLOT CONVECTION: A LINEAR STUDY
A. McAllister (Tokyo Univ., Japan.), R. Steinolfson (Southwest Research Inst., San Antonio, TX.), and T. Tajima Nov. 1992 65 p
(Contract DE-FG05-80ET-53088)
(DE93-007643; DOE/ET-53088/584; IFSR-584) Avail: CASI HC A04/MF A01

The linear stability properties of fluid convection in a vertical slot were studied. We use a Fourier-Chebychev decomposition to set up the linear eigenvalue problems for the Vertical Slot Convection and Benard problems. The eigenvalues, neutral stability curves, and critical point values of the Grashof number, G, and the wavenumber were determined. Plots of the real and imaginary parts of the eigenvalues as functions of G and (alpha) are given for a wide range of the Prandtl number, Pr, and special note is made of the complex mode that becomes linearly unstable above Pr approximately 12.5. A discussion comparing different special cases facilitates the physical understanding of the VSC equations, especially the interaction of the shear-flow and buoyancy induced physics. Making use of the real and imaginary eigenvalues and the phase properties of the eigenmodes, the eigenmodes were characterized. One finds that the mode structure becomes progressively simpler with increasing Pr, with the greatest complexity in the mid ranges where the terms in the heat equation are of roughly the same size. WEAKLY NONLINEAR DYNAMICS OF NEAR-CJ DETONATION WAVES
J. B. Bdzil and R. Klein (Technische Hochschule, Aachen, Germany.) 1993 28 p Presented at the ICASE Symposium on Hypersonic Propulsion, Langely, VA, Oct. 1992
(Contract W-7405-eng-36)
(DE93-007344; LA-UR-93-165; CONF-9210298-1) Avail: CASI HC A03/MF A01

The renewed interest in safety issues for large scale industrial devices and in high speed combustion has driven recent intense efforts to gain a deeper theoretical understanding of detonation wave dynamics. Linear stability analyses, weakly nonlinear bifurcation calculations, as well as full scale multi-dimensional direct numerical simulations have been pursued for a standard model problem based on the reactive Euler equations for an ideal gas with constant specific heat capacities and simplified chemical reaction models. Most of these studies are concerned with overdriven detonations. This is true despite the fact that the majority of all detonations observed in nature are running at speeds close to the Chapman-Jouguet (CJ) limit value. By focusing on overdriven waves, one removes an array of difficulties from the analysis that is associated with the sonic flow conditions in the wake of a CJ-detonation. In particular, the proper formulation of downstream boundary conditions in the CJ-case is a yet unsolved analytical problem. A proper treatment of perturbations in the back of a Chapman-Jouguet detonation has to account for two distinct weakly nonlinear effects in the forward acoustic wave component. The first is a nonlinear interaction of highly temperature sensitive chemistry with the forward acoustic wave component in a transonic boundary layer near the end of the reaction zone. The second is a cumulative three-wave-resonance in the sense of Majda et al., which is active in the near-sonic burnt gas flow and which is essentially independent of the details of the chemical model. In this work, we consider detonations in mixtures with moderate state sensitivity of the chemical reactions. Then, the acoustic perturbations do not influence the chemistry at the order considered and we may concentrate on the second effect: the three-wave resonance. DOE

HAMILTONIAN DYNAMICS OF COUPLED POTENTIAL VORTICITY AND INTERNAL WAVE MOTION: 1. LINEAR MODES Final Technical Report, 1 Jun. 1989 - 30 Nov. 1992
Henry D. Abarbanel and Ali Rouhi 17 Feb. 1993 29 p
(Contract N00014-89-J-1912)
(AD-A263469) Avail: CASI HC A03/MF A01

This proposal describes work to be carried out extending the study of phase-space density representations of the fluids dynamics to the case where the fluid density is not constant, but the fluid is incompressible, so the fluid velocity satisfies Delta(u) = 0. This will allow the phase-space density representation to describe inhomogeneous fluids. Since the phase space density representation is ideally suited to making time scale separations of the form needed for isolating geostrophic and quasi-geostrophic motions of the full fluid equations and doing so in a fully Hamiltonian fashion, this improvement on past work will enable the inclusion of density variations into the Hamiltonian formulation of these mesoscale geophysical motions. The extension of phase space density formulation of fluids to this case will allow the study of the interplay between internal wave motions--fast density variations--and mesoscale motions--far slower geostrophic and quasi-geostrophic motions. The proposal describes, in outline, the work which will be carried out by the principal investigator and a graduate student over a period of three years which will formulate the Hamiltonian version of inhomogeneous, incompressible flows in phase space density form and separate out the slow and fast motions relevant to geophysical flows. A PARALLEL IMPLICIT INCOMPRESSIBLE FLOW SOLVER USING UNSTRUCTURED MESHES Interim Report
Ravi Raniamurti and Rainald Lohner 17 Jan. 1993 33 p
(AD-A263395; NRL/MR/6410-93-7178) Avail: CASI HC A03/MF A01

An incompressible flow solver based on unstructured grids is implemented on a parallel distributed memory computer architecture. An important phase in the flow solver is the solution of the elliptic equations for the velocities and pressure. This elliptic solver is parallelized and incorporated into both the explicit and implicit versions of the incompressible flow solver. Performance and scalability studies are carried out on both Intel iPSC 860 and the Intel Delta prototype, and show that the code is scalable. A parallelizable load balancing algorithm is developed to be used in conjunction with the incompressible flow solver. Steady and unsteady flows over a tri-element airfoil and NACA0012 airfoil are computed using the parallel incompressible flow solver. DTIC

IMPROVED HEAT REMOVAL BY MICROSCOPIC SURFACE TEXTURING OF CAPILLARIES Final Report, 1 Apr. - 30 Oct. 1992
Charles C. Blatchley Oct. 1992 39 p
(Contract F33615-92-C-2252)
(AD-A263483; WL-TR-93-1060) Avail: CASI HC A03/MF A01

Phase 1 demonstrated that ion beam microtexturing of metal surfaces enhances heat transfer under three conditions: (1) thermal radiation emission at relatively high temperatures, (2) forced convection, and (3) nucleate boiling. Features were too small to significantly affect heat transfer under non-flowing constant phase conditions. For nucleate boiling, combining microtexture with large scale structures, and after optimizing the texturing process, it should be possible to achieve a composite enhancement better than 20 times the nucleate-boiling heat transfer from a smooth surface. Ion texturing processes produce rugged broadband light absorbers, completely black from the visible to long wavelength IR. At higher temperature ranges, enhanced radiation adds significantly to total heat transferred. Thus, heat pipes, capillaries, and higher temperature radiators would all perform better with microtextured surfaces. DTIC

THREE-DIMENSIONAL FIBER-OPTIC LDV MEASUREMENTS IN THE ENDWALL REGION OF A LINEAR CASCADE OF CONTROLLED-DIFFUSION STATOR BLADES M.S. Thesis
David M. Dober 25 Mar. 1993 127 p
(AD-A263513) Avail: CASI HC A07/MF A02

Measurements were taken of the vortex system that results from the interaction between a stator blade tip and the approaching endwall boundary layer in a linear cascade of controlled-diffusion compressor stator blades. Measurements were taken at Reynolds numbers based on stator blade chord of 240000 and 711000. Total pressure measurements were first conducted upstream and downstream of the controlled-diffusion stator blades. The approaching boundary layer was characterized and the location of the downstream vortices were approximated. Upstream and downstream three-dimensional fiber-optic LDV surveys were then conducted to observe the velocity profiles of the approaching boundary layer and to map the location and velocity characteristics of the downstream vortex system. Results clearly show the effect that the over-all secondary flow in the blade passage has on the location of the two oppositely rotating vortices. The downstream flow characteristics were also shown to be periodic.

HYDRODYNAMIC INTERACTIONS AMONG FIBERS IN HIGH EFFICIENCY FILTERS
M. Sahraoui, H. Marshall, and M. Kaviany 29 Oct. 1992 37 p Prepared for Lawrence Livermore National Lab., CA

(Contract W-7405-eng-48)
(DE93-007117; UCRL-CR-111783) Avail: CASI HC A03/MF A01

In this report we present a review of the various analytical solutions for the two-dimensional flow in a model fibrous filter made of periodic arrangements of cylinders. These two-dimensional analytical solutions include the various treatments, namely the creeping flow, the inviscid flow, the swarm theory, and the Oseen approximation. We examine in detail the commonly used solutions of Happel, Kuwabara, and the swarm theory of Neale and Nader. We also examine the three-dimensional solutions of Banks obtained by the superposition of the two-dimensional analytical solutions. A review of the different numerical solutions for the flow over cylinders is also given. In addition, we also present an analytical solution which is an extension to the Kuwabara solution and uses the actual boundaries of the square unit cell. The first term of this extended analytical solution is the Kuwabara solution. A two-dimensional numerical solution is also presented for the rectangular and square unit cells. This numerical solution is used to determine the effect of the unit cell anisotropy on the pressure drop across the unit cell. The numerical solution is used for comparison with the analytical solutions of Kuwabara, Happel, and our extended solution. The analytical solution of Kuwabara and Happel show significant error, especially near the boundaries of the unit cell. The extended analytical solution shows good agreement with the numerical results. The ongoing three-dimensional numerical solution of flow over cylinders is also discussed. DOE

SIPHON BREAKER DESIGN REQUIREMENTS
D. T. Neill and A. G. Stephens Mar. 1993 222 p
(Contract DE-FG07-88ER-12820)
(DE93-011799; DOE/ER-12820/T1) Avail: CASI HC A10/MF A03

The Siphon Breaker Design Requirements Project was intended to provide experimental data on siphon flow effects. In addition, the experimental system was to be modeled with the RELAP code and the predicted and measured performances compared. The design and operation of the siphon breaker experimental equipment from 1989 to 1991 are described. In addition the test results for all the experimental runs made in 1990 and 1991 are presented and described. Unfortunately, useful results were not obtained from a RELAP 5 model of the siphon system; consequently, we are unable to present any predictive calculations for comparison with the data presented. We have had lots of expert advice from several sources on using the RELAP code but to date our efforts have remained unsuccessful. After an extra year of effort, admittedly part-time but a lot of that, the modeling efforts was abandoned and the experimental equipment and test results are described. DOE

PULSE MITIGATION AND HEAT TRANSFER ENHANCEMENT TECHNIQUES. VOLUME 2: EFFECT OF SURFACE WETTABILITY AND ROUGHNESS IN EVAPORATIVE SPRAY COOLING Final Report, 1 Jul. 1987 - 31 Jul. 1992
L. C. Chow, M. S. Sehmbey, and M. R. Pais 31 Jul. 1992 141 p
(Contract F33615-87-C-2777)
(AD-A264174; UK-ME-92-05; WL-TR-92-2096) Avail: CASI HC A07/MF A02

In the spray cooling of a heat surface, variations in the surface contact angle cause a change in nucleation characteristics and thereby influence the heat transfer process. The surface roughness variations affect the thickness of the liquid film formed by the spray; this has a profound effect on the heat transfer from the surface. The effect of these two parameters is studied experimentally under different spray conditions involving an air atomizing nozzle. DTIC

(AD-A264341; AFOSR-93-0240TR) Avail: CASI HC A03/MF A01

Significant progress has been made in the following areas: (1) nonlinear spectroscopy of micrometer sized droplets, and (2) development and application of two- and three-dimensional scalar and velocity measurement techniques in flames. In the nonlinear spectroscopy area, the following achievements are reported: (1) fluorescence seeding of the stimulated Raman scattering (SRS) in order to increase the detectivity (by as much as 10X) of minor species in a multicomponent liquid droplet that contains a fluorescent dye; (2) temporal precession of the SRS as a means of determining the shape distortion (7 parts out of 10(exp 3)) of a flowing droplet because of inertial force; (3) preliminary measurements of the relative evaporation rates of 15 droplets in a segmented stream where the few lead droplets evaporate faster than the remaining droplets; and (4) suppression of lasing by the SRS and amplification of the SRS in microdroplets, leading to an increased SRS signal. A two-and-a-quarter-year multi-tasked research project was pursued by the present investigators to study dynamic stall phenomenon under AFOSR sponsorship between Feb. 1990 - May 1992. The major objective was to predict and control the dynamic stall phenomenon in 2-D and 3-D flows. In the process of achieving these objectives, significant effort was directed towards developing mathematical models and the corresponding computational methods which were made available to interested researchers and organizations involved in computational fluid dynamics (CFD) research. The analyses developed included a two-dimensional Navier-Stokes (NS) analysis for a general body undergoing arbitrary three-degree-of-freedom maneuvers; detailed results are provided for this class of flows. For enhancement of accuracy and efficiency, an adaptive-grid time-accurate flow solution technique was developed to enable improved resolution of the various length scales in a vortex-dominated unsteady flow. A multi-block grid generation analysis is developed for a 3-D rectangular planform wing. For the corresponding flow analysis using velocity-vorticity variables and direct-solution philosophy, the difficulties experienced were clearly discussed in the annual report submitted a year ago in November 1991. This 3-D flow analysis was therefore temporarily set aside. It will be pursued further in a subsequent grant, and the progress made on it will be reported in a forthcoming annual report for that grant. In the current grant, the study of

3-D flows was continued, using an iterative solution methodology. Hence, a 3-D unsteady Navier-Stokes analysis, again using velocity-vorticity variables, and an iterative solution technique with multi-grid acceleration were developed. DTIC

TOPOLOGY AND GRID ADAPTION FOR HIGH-SPEED FLOW COMPUTATIONS Final Report, 1 Jan. - 31 Dec. 1987
Jamshid S. Abolhassani and Surendra N. Tiwari Washington Mar. 1989 139 p
(Contract NCC1-68; RTOP 505-90-21-02)
(NASA-CR-4216; NAS 1.26:4216) Avail: CASI HC A07/MF A02

This study investigates the effects of grid topology and grid adaptation on numerical solutions of the Navier-Stokes equations. In the first part of this study, a general procedure is presented for computation of high-speed flow over complex three-dimensional configurations. The flow field is simulated on the surface of a Butler wing in a uniform stream. Results are presented for Mach number 3.5 and a Reynolds number of 2,000,000. The O-type and H-type grids have been used for this study, and the results are compared together and with other theoretical and experimental results. The results demonstrate that while the H-type grid is suitable for the leading and trailing edges, a more accurate solution can be obtained for the middle part of the wing with an O-type grid. In the second part of this study, methods of grid adaption are reviewed and a method is developed with the capability of adapting to several variables. This method is based on a variational approach and is an algebraic method. Also, the method has been formulated in such a way that there is no need for any matrix inversion. This method is used in conjunction with the calculation of hypersonic flow over a blunt-nose body. A movie has been produced which shows simultaneously the transient behavior of the solution and the grid adaption. Author (revised)

ANALYTICAL AND EXPERIMENTAL STUDY OF LAMINAR FREE CONVECTIVE HEAT TRANSFER FROM ISOTHERMAL CONVEX BODIES OF ARBITRARY SHAPE Ph.D. Thesis
Khosrow Jafarpur 1992 375 p
(ISBN-0-315-72512-5) Avail: Univ. Microfilms Order No. DANN72512

An analytical and experimental study of laminar free convection from bodies of arbitrary convex shape is performed to determine the effect of shape, aspect ratio, and orientation of isothermal bodies on the area-averaged Nusselt number over a wide range of Rayleigh and Prandtl numbers. Also, a simple procedure is provided for predicting laminar free convection heat transfer from bodies of arbitrary convex shape, based upon a characteristic length using the square root of the total body surface area, square root of A. To examine the theoretical basis for the Nu-Ra expressions, a new simple, but accurate, approximate analytical method is developed. The proposed method is novel in: linearizing the convective terms, reducing a convective problem to a simpler transient conduction problem for which a solution may exist, and also obtaining an explicit expression for an 'effective velocity' in free convection boundary layer flow, as a function of the Prandtl number. The end result of this method is an explicit expression in terms of a simple superposition of two limits: diffusive limit and laminar boundary layer solution. To predict the laminar boundary layer limit, information regarding the dependency on Prandtl number and the body gravity function is required. By providing different exact and approximate methods, such as the same characteristic lengths and aspect ratios method or the inscribing and circumscribing method (the bounds method), the two asymptotes can be determined for any given shape. This includes body shapes such as the so-called two-dimensional bodies, disks, bodies of small aspect ratios and vertical cylinders of different aspect ratios. In the experimental program, through a transient cooling process and pressure variation technique, the measurement of heat transfer by free convection from isothermal bodies to air is conducted. Due to the nature of the experimental technique adopted and the need for the heat capacity, in a separate and single test at pressures below 10(exp -6) torr, the effective surface emissivity and heat capacity of each body are estimated. The predictions are compared with the experimental data and other sources; very good agreement in almost all of the cases is observed. The simplicity, generality, and accuracy used in the analytical models make the proposed method superior for predicting free convection heat transfer from isothermal convex bodies for the laminar range of Ra and all Prandtl numbers. PULSE MITIGATION AND HEAT TRANSFER ENHANCEMENT TECHNIQUES. VOLUME 5: TRANSIENT LIQUID MOVEMENT IN HEAT PIPE WICKS Final Report, 1 Jul. 1987 - 31 Jul. 1992
L. C. Chow and J. H. Abrose Aug. 1992 165 p
(Contract F33615-87-C-2777)
(AD-A264513; UK-ME-92-01; WL-TR-92-2099) Avail: CASI HC A08/MF A02

A new transient model for the liquid flow is presented. The continuous distribution of the saturation in the wick is modeled, where previous models had assumed a uniformly saturated structure. Solution of the liquid flow model requires that the saturation dependence of the capillary flow properties be known. These properties must be determined experimentally because of the complex geometry of the porous wick structures. An experimental study of the flow properties was performed for the case of multilayer mesh wicks. X-ray radiography was used to determine saturation distributions in the wicks for a variety of conditions. Capillary pressure and relative permeability were determined from independent experiments. Results of the transient liquid flow model compare favorably with the results from the heat pipe experiments. DTIC

ERRORS WHEN SHOCK WAVES INTERACT DUE TO NUMERICAL SHOCK WIDTH
R. Menikoff Mar. 1993 16 p Presented at the MSI/Stony Brook Conference on Nonlinear Analysis and Computation, Stony Brook, NY, 8-9 Apr. 1993
(Contract W-7405-eng-36)
(DE93-010699; LA-UR-93-958; CONF-9304105-1) Avail: CASI HC A03/MF A01

A simple test problem proposed by Noh, a strong shock reflecting from a rigid wall, demonstrates a generic problem with numerical shock capturing algorithms at boundaries that Noh called 'excess wall heating'. We show that the same type of numerical error occurs in general when shock waves interact. The underlying cause is the non-uniform convergence to the hyperbolic solution of the inviscid limit of the solution to the PDE's with viscosity. The error can be understood from an analysis of the asymptotic solution. For a propagating shock, there is a difference in the total energy of the parabolic wave relative to the hyperbolic shock. Moreover, the relative energy depends on the strength of the shock. The error when shock waves interact is due to the difference in the relative energies between the incoming and outgoing shock waves. It is analogous to a phase shift in a scattering matrix. A conservative differencing scheme correctly describes the Hugoniot jump conditions for a steady propagating shock. Therefore, the error from the asymptotics occurs in the transient when the waves interact. The entropy error that occurs in the interaction region remains localized but does not dissipate. A scaling argument shows that as the viscosity coefficient goes to zero, the error shrinks in spatial extention but is constant in magnitude. Noh's problem of the reflection of a shock from a rigid wall is equivalent to the symmetric impact of two shock waves of the opposite family. The asymptotic argument shows that the same type of numerical error would occur when the shocks are of unequal strength. Thus, Noh's problem is indicative of a numerical error that occurs when shocks interact due to the numerical shock width. DOE

TOWARDS A BETTER HYDRO FOR DYNAMIC MIX CALCULATIONS
J. Binstock 1993 14 p Presented at the 4th International Workshop on the Physics of Compressible Turbulent Mixing, Cambridge, England, 29 Mar. - 1 Apr. 1993
(Contract W-7405-eng-36)
(DE93-010702; LA-UR-93-923; CONF-9303126-1) Avail: CASI HC A03/MF A01

A difference equation technique suitable for clean, dynamic mix, and turbulence Lagrangian calculations is shown. This new technique is compared to the standard one for clean one-dimensional calculations of the Noh, Sedov Blast Wave, and Strong Shock Tube test problems, and for a one-dimensional two-phase flow dynamic mix calculation of a modified Noh problem: all test problems involving shocks. The new technique is shown to dramatically reduce the noise in the calculated hydrodynamic quantities of pressure, density, specific internal energy, and Lagrangian interface velocity. DOE

MULTIPARTICLE IMAGING TECHNIQUE FOR TWO-PHASE FLUID FLOWS USING PULSED LASER SPECKLE VELOCIMETRY
T. A. Hassan Dec. 1992 114 p
(Contract DE-FG02-88ER-12813)
(DE93-011734; DOE/ER-12813/1) Avail: CASI HC A06/MF A02

The practical use of Pulsed Laser Velocimetry (PLV) requires the use of fast, reliable computer-based methods for tracking numerous particles suspended in a fluid flow. Two methods for performing tracking are presented. One method tracks a particle through multiple sequential images (minimum of four required) by prediction and verification of particle displacement and direction. The other method, requiring only two sequential images uses a dynamic, binary, spatial, cross-correlation technique. The algorithms are tested on computer-generated synthetic data and experimental data which was obtained with traditional PLV methods. This allowed error analysis and testing of the algorithms on real engineering flows. A novel method is proposed which eliminates tedious, undesirable, manual, operator assistance in removing erroneous vectors. This method uses an iterative process involving an interpolated field produced from the most reliable vectors. Methods are developed to allow fast analysis and presentation of sets of PLV image data. Experimental investigation of a two-phase, horizontal, stratified, flow regime was performed to determine the interface drag force, and correspondingly, the drag coefficient. A horizontal, stratified flow test facility using water and air was constructed to allow interface shear measurements with PLV techniques. The experimentally obtained local drag measurements were compared with theoretical results given by conventional interfacial drag theory. Close agreement was shown when local conditions near the interface were similar to space-averaged conditions. However, theory based on macroscopic, space-averaged flow behavior was shown to give incorrect results if the local gas velocity near the interface was unstable, transient, and dissimilar from the average gas velocity through the test facility. DEVELOPMENT OF A CFD CODE FOR CASTING SIMULATION Final Report
Jesse E. Murph 15 Jan. 1993 71 p Original contains color illustrations
(Contract NAS8-39241)
(NASA-CR-192577; NAS 1.26:192577; ERC/HSV-TR93-01) Avail: CASI HC A04/MF A01; 9 functional color pages

Because of high rejection rates for large structural castings (e.g., the Space Shuttle Main Engine Alternate Turbopump Design Program), a reliable casting simulation computer code is very desirable. This code would reduce both the development time and life cycle costs by allowing accurate modeling of the entire casting process. While this code could be used for other types of castings, the most significant reductions of time and cost would probably be realized in complex investment castings, where any reduction in the number of development castings would be of significant benefit. The casting process is conveniently divided into three distinct phases: (1) mold filling, where the melt is poured or forced into the mold cavity; (2) solidification, where the melt undergoes a phase change to the solid state; and (3) cool down, where the solidified part continues to cool to ambient conditions. While these phases may appear to be separate and distinct, temporal overlaps do exist between phases (e.g., local solidification occurring during mold filling), and some phenomenological events are affected by others (e.g., residual stresses depend on solidification and cooling rates). Therefore, a reliable code must accurately model all three phases and the interactions between each. While many codes have been developed (to various stages of complexity) to model the solidification and cool down phases, only a few codes have been developed to model mold filling. Author (revised)

ANALYSIS AND COMPUTATION FOR VORTEX DYNAMICS AND RAREFIED GASES Final Report, 1 Nov. 1989 - 31 Oct. 1992
Russel Caflisch Dec. 1992 3 p
(Grant AF-AFOSR-0013-90)
(AD-A264705; AFOSR-93-0324TR) Avail: CASI HC A01/MF A01

The researchers have developed a variety of adapted orthogonal transforms for signal compression and analysis. These methods have been used successfully in sound and high resolution image compression and are currently being tested for their technological value. In parallel, the best basis algorithm has been used by K. Sreenivasan for analysis of experimental turbulence data, and by M. Farge and V. Wickerhauser for the analysis of simulated two dimensional vorticity fields. This analysis permits a more careful comparison between simulation and experiment by detecting subtle differences in structures. By extracting coherent structures in the flows, it promises to permit efficient tracking of these structures. In particular, as a result of testing by the FBI and Scotland Yard, a variant of these algorithms has been chosen as a standard for fingerprint image compression with an estimated initial saving to the FBI in storage hardware alone of $25,000,000. These methods are also being tested, in collaboration with Martin Marietta, for automatic target recognition. DTIC

SOME IMPLICATIONS OF A DIFFERENTIAL TURBOMACHINERY EQUATION WITH VISCOUS CORRECTION
Herman B. Urbach Mar. 1993 27 p
(AD-A264693; CDNSWC-MRD-80-93-10) Avail: CASI HC A03/MF A01

A differential equation describing the energy transfer between a fluid and a body moving in that fluid was derived. The derivation, based upon the Coriolis form of the Navier-Stokes equation, contains a rigorous viscous correction. For inviscid ideal cases, the equation demonstrates that the rate of total enthalpy transfer from (or to) the system is a function of the transverse component of the pressure gradient. Therefore, for practical turbomachinery rotors, the derivative, del(p)/del(theta) can never vanish. On integration of the differential equations, a form of the Euler Turbomachinery Equation with viscous correction is derived. The resultant form contains two distinct work rate terms for the axial and radial components of the flow. The fact that integration yields a result which approximates the classic Euler Turbomachinery Equation constitutes confirmation of the derivation. An application of the equation to an ideal infinite linear cylinder with bound vorticity was developed, yielding the expected known result. DTIC

THE STRUCTURE AND DYNAMICS OF THE VORTICITY AND PASSIVE SCALAR FIELDS AT SMALL SCALES IN HOMOGENEOUS ISOTROPIC TURBULENCE Ph.D. Thesis
Gregory R. Ruetsch 1992 127 p
Avail. Univ. Microfilms Order No. DA9308880

Using direct numerical simulations of homogeneous isotropic turbulence, the small-scale structures of the vorticity and passive scalar fields were investigated. Both statistical and visual techniques were used to examine quantities that appear in the evolutions equations for the enstrophy and scalar gradient. Tube like regions of intense enstrophy contain large positive, and sometimes negative, enstrophy production, and regions of mostly moderate-valued kinetic energy dissipation surround these tubes. The statistical techniques show that although activity in these vortex tubes is large, on a volume normalized basis, by far the largest contributions to the terms in the evolution equations, along with the energy dissipation, are from low-level 'background' activity. Although sheets of intense scalar gradient are found to wrap around the vortex tubes, the most intense scalar gradient sheets are dissociated from the vortex tubes. Both the enstrophy and strain-rate are small in the vicinity of these sheets. It was determined that the persistence and not the strength of the strain field is responsible for the production of these intense scalar gradient sheets. Persistent strain fields are set up by pairs of vortices with approximately equal circulation, which most frequently occur when the vortices are weak. Both antiparallel and parallel configurations of such vortices are observed. The temporal evolution of these structures was also investigated. Sheets of vorticity are found to undergo a transition which can be qualitatively described by the Kelvin-Helmholtz instability. This process is responsible for the formation of the vortex tubes. In addition, antiparallel regions of vorticity were found to collapse and produce vortex sheets. These pairs of vortex sheets are effective in producing persistent strain, and therefore intense scalar gradient sheets. Dissert. Abstr.

AN ADAPTIVE LAGRANGIAN METHOD FOR COMPUTING 1-D REACTING FLOWS AND THE THEORY OF RIEMANN INVARIANT MANIFOLDS FOR THE COMPRESSIBLE EULER EQUATIONS Ph.D. Thesis
Tasso Lappas 1993 126 p
Avail: Univ. Microfilms Order No. DA9307041

A method for computing one dimensional unsteady compressible flows, with and without chemical reactions is presented. Focus was on the accurate computation of the discontinuous waves that arise in such flows. The main feature of the method is the use of an adaptive Lagrangian grid. This allows the computation of discontinuous waves and their interactions with the accuracy of front-tracking algorithms. This is done without the use of additional grid points representing shocks, in contrast to conventional front-tracking schemes. The Lagrangian character of the present scheme also allows contact discontinuities to be captured easily. The algorithm avoids interpolation across discontinuities in a natural and efficient way. The method was used on a variety of reacting and non-reacting flows in order to test its ability to compute accurately and in a robust way complicated wave interactions. A new approach for computing multidimensional flows of an inviscid gas is presented. The goal is to use the knowledge of the one-dimensional characteristic problem for gasdynamics to compute genuinely multidimensional flows in a mathematically consistent way. A family of spacetime manifolds is found on which an equivalent 1-D problem holds. These manifolds are referred to as Riemann Invariant Manifolds. Their geometry depends on the local spatial gradients of the flow and they provide locally a convenient system of coordinate surfaces for space time. In the case of zero entropy gradients, functions analogous to the Riemann invariants of 1-D gasdynamics can be introduced. These generalized Riemann Invariants are constant on the Riemann Invariant Manifolds. The equations of motion are integrable on these manifolds and the problem of computing the solution becomes that of determining the geometry of these manifolds locally in space time. Their geometry is examined and, in particular, their relation to the characteristic surfaces. It turns out that they can be space-like or time-like, depending on the flow gradients. An important parameter is introduced which plays the role of a Mach number for the wave fronts that these manifolds represent. This theory can be viewed as the extension of the method of characteristics to multidimensional unsteady flows. There are many ways of using the theory to develop practical numerical schemes. It is shown how it is possible to correct a conventional second-order Godunov scheme for multidimensional effects, using this theory. A family of second-order conservative Godunov schemes is derived using the theory of Riemann Invariant Manifolds, for the case of two-dimensional flow. The extension to three dimensions is straightforward. One of these schemes is used to compute two standard test cases and a two dimensional inviscid shear layer. Dissert. Abstr.

NUMERICAL WAVE PROPAGATION AND STEADY-STATE SOLUTIONS Ph.D. Thesis
Karim MazaheriBody 1992 232 p
Avail: Univ. Microfilms Order No. DA9308394

In solving steady-state problems (governed by the Euler equations) with unsteady solution process, error waves can be damped or eliminated at three different places: the inner boundary; the computational field; and the outer boundary. Presented are techniques for doing this leading to faster convergence to a steady state. Visualization techniques which help to understand, design, and develop new ideas regarding this view point of convergence acceleration, are also presented. Error waves are damped at the inner boundary by using a soft wall condition, instead of the common rigid wall boundary condition. This boundary condition is analyzed, and the optimum way to implement it is derived. Its application in two space dimensions for both upwind and central differencing codes is developed, and in subsonic flows with no shocks, gains of more than 50 percent in running time are reported. Error waves in the computational field are damped by adding a bulk viscosity term to the momentum equations. After analysis of its effects in linearized equations, its explicit and implicit implementation in one and two space dimensions are studied. Its successful performance in combination with the soft-wall boundary condition and residual smoothing is also reviewed. It is shown how this new term can stabilize and accelerate the computation of low-Mach-number flows. Finally to improve the convergence acceleration via the outer boundary, the well-known topic of absorbing boundary conditions is partially reviewed. It is shown that in many cases the outgoing waves are not, as commonly assumed, normal to the outer boundary. It is shown how slowing down the waves near the outer boundary can accelerate the convergence, and some new boundary models are introduced which take into account the angle of incidence to minimize the reflections. Dissert. Abstr.

The construction of a family of shock capturing schemes is considered: the Godunov type schemes. A review of these schemes is given in the case of the time dependent one dimensional equations of compressible fluid mechanics, as developed in recent years. The construction of the Godunov type schemes are examined for two dimensional problems in space and applied to the compressible Navier-Stokes equations. Numerical results of the study of the instability of transonic and supersonic shear flows are shown. Godunov type schemes for the one dimensional equations of compressible fluid mechanics in Lagrange coordinates were constructed. A simple Godunov type scheme for the equations of relativistic hydrodynamics was proposed. Numerical results for several test problems are presented. ESA

THE DESIGN AND TESTING OF A HIGH-TEMPERATURE GRAPHITE DILATOMETER Technical Report
Patrick M. Sheaffer and George W. Henderson 24 Jun. 1992 46 p
(Contract F04701-85-C-0086)
(AD-A262185; TR-0088(3935-06)-2; SSD-TR-92-25) Avail: CASI HC A03/MF A01

A dilatometer for investigating the high-temperature behavior of carbonaceous materials has been constructed within a graphite tube furnace in the Composites Section of the Mechanics and Materials Technology Center of The Aerospace Corporation. The dilatometer is a single-pushrod type with a linear variable differential transformer (LVDT) dilation measurement system and employs computer data acquisition and analysis. It can measure thermally induced strain of a sample from room temperature to over 3000 deg C, a temperature that has been difficult to reach with currently available laboratory apparatus. The estimated uncertainty of the dilation measurement system is about +/- 5 microns over the entire temperature range. All components in the hot zone, including the sample holder and pushrod, are made of polycrystalline graphite. A three-point-bend fixture can be placed in the apparatus to measure the rheological properties of a pyrolyzing carbon precursor or the high-temperature creep properties of a carbon under conditions of constant flexural stress. RADIOMETRIC CALIBRATION SYSTEM FOR IR CAMERAS
H. S. Park, D. W. Dobie, T. E. Ferretta, D. B. Hakala, M. P. Nolan, and E. L. Parker 15 May 1992 8 p Presented at the International Society for Photo Optical Engineering Conference, Orlando, FL, 20-24 Apr. 1992
(Contract W-7405-eng-48)
(DE93-009237; UCRL-JC-108444; CONF-920471-6) Avail: CASI HC A02/MF A01

An automated calibration system that was developed to calibrate IR flight cameras for a series of sub-orbital experiments is described. Short schedules as well as concern over cryo-cooler lifetimes dictated a totally automated calibration system that obtained as much data as possible over a short period of time. The data must be as complete as possible since the cameras are not recovered. For this reason the system calibrates each pixel individually. The output of the calibration is a set of calibration coefficients which convert the gray level output of the camera into physical units of radiance (Watts/cm(sub 2)-str-microns). The Hughes 256 x 256 pixels PtSi cameras and 128 x 128 pixels HgCd cameras and Amber 128 x 128 pixels InSb cameras were calibrated. These cameras put out 8 bit digital data and sync signal at a given camera setting. The calibration acquisition system is described and the results for the Hughes 256 x 256 PtSi camera are shown. FLASH X RAY SYSTEM: TECHNIQUES AND APPLICATIONS
J. C. Lanoue and R. B. Berry Mar. 1993 19 p
(Contract DE-AC04-76DP-00789)
(DE93-011477; SAND-92-2442) Avail: CASI HC A03/MF A01

High speed flash radiography has been used to record phenomena that occur during rapid dynamic events. The events are difficult, if not impossible, to record by other means due to the speed of the event or the obscuration associated with it. To eliminate the motion blur of objects moving at high speeds, it is necessary to have extremely short exposure times. This short exposure time requires the use of high speed intensifying screens and high speed x-ray film to record the radiographic image. Technicians who use flash x-rays have to depend on recommendations from present and former flash x-ray users for film and screen selection. The film and screen industry has made many changes in the last few years. It is not uncommon to find that the particular film or screen used in the past is no longer manufactured. This paper will describe some of the films and screens that are currently used for testing. It will also describe the optimum experimental setup used to obtain the best images. DOE

MEASUREMENT OF A MICHELSON INTERFEROMETER MIRROR VELOCITY WITH A TIME INTERVAL ANALYZER Final Report, Feb. - Jun. 1992
R. J. Combs, R. B. Knapp, and C. T. Cathey (Tri-Square Corp., Ormand Beach, FL.) Jul. 1992 46 p
(AD-A263009; CRDEC-TR-356) Avail: CASI HC A03/MF A01

This report documents the design, construction, and implementation of a time interval analyzer (TIA). The TIA is a precision counter that measures the dynamic variation in the time intervals (i.e., frequency) of a signal. The helium-neon (HeNe) laser signal from the servo-mirror control circuitry of the interferometer provides a nearly constant frequency source. The HeNe signal frequency is directly proportional to the interferometer mirror velocity. A constant velocity is crucial for the proper operation of a Michelson interferometer, which is used in a Fourier transform spectrometer. The TIA provides a critical evaluation of velocity variations in a single interferometer mirror scan via analysis of the HeNe laser signal. DTIC

ENHANCED NONCONTACTING LASER EXTENSOMETER FOR BIAXIAL STRAIN MEASUREMENTS Final Report, Jan. - Aug. 1992
James J. Connolly, James R. Engel, and Andrew T. Lintz Sep. 1992 42 p
(Contract DAAL04-92-C-0005)
(AD-A263170; MTL-TR-92-60) Avail: CASI HC A03/MF A01

In the proposed program, OPTRA will develop and commercialize a non-contact biaxial extensometer for the material testing market. The optical technology, based on an existing OPTRA single axis product, allows the accurate measurement of surface strains on any test specimen without contact and without material preparation. The non-contact measurement in ideal for high temperature testing, single fiber testing, high humidity/liquid immersed testing, high strain elastomer testing and many other applications that are unsuitable for bonded gages. The incorporation of two axes of strain measurement in a single instrument allows users to measure shear strain, Poisson's ratio, and other biaxial strain conditions. The ability to reorient the measurement axes relative to the test specimen in real time with small cyclic loading allows the user to rapidly identify the maximum and minimum normal strain axes and thereby fully define an unknown state of plane strain. The product development will be focussed on meeting a wide range of material test requirements and on keeping production costs low to insure that a commercially viable product is produced. DTIC

GYROSCOPE WITH EXCESS NOISE SUBTRACTION Patent Application
Robert P. Moeller, inventor (to Navy) and William K. Burns, inventor (to Navy) 30 Nov. 1992 22 p
(AD-D015698; US-Patent-Appl-SN-983335; Navy-Case-73910) Avail: CASI HC A03/MF A01

A system and method for subtracting excess noise from a high sensitivity gyroscope system in which a laser diode array is focused into an Nd-doped active fiber is described. A resultant gyro signal is polarized, detected, and amplified. A noise signal is polarized, delayed, detected, and amplified such that the noise signal is polarized parallel to the gyro signal and delayed by a fiber delay of a length equal to a length of gyroscope fiber coil. The excess noise component in the amplified gyro signal is reduced by modulating the amplified noise signal with a portion of the amplified gyro signal and subtracting the amplitude-modulated noise signal from the amplified gyro signal to produce a reduced noise gyro signal. PROGRAM FOR AN IMPROVED HYPERSONIC TEMPERATURE-SENSING PROBE
Richard J. Reilly Jun. 1993 63 p
(Contract NAS2-13457; RTOP 505-68-50)
(NASA-CR-186025; H-1893; NAS 1.26:186025) Avail: CASI HC A04/MF A01

Under a NASA Dryden-sponsored contract in the mid 1960s, temperatures of up to 2200 C were successfully measured using a fluid oscillator. The current program, although limited in scope, explores the problem areas which must be solved if this technique is to be extended to 10,000 R. The potential for measuring extremely high temperatures, using fluid oscillator techniques, stems from the fact that the measuring element is the fluid itself. The containing structure of the oscillator need not be brought to equilibrium temperature with with the fluid for temperature measurement, provided that a suitable calibration can be arranged. This program concentrated on review of high-temperature material developments since the original program was completed. Other areas of limited study included related pressure instrumentation requirements, dissociation, rarefied gas effects, and analysis of sensor time response. Author

(Contract DE-AC03-76SF-00098)
(DE93-007656; LBL-33039) Avail: CASI HC A07/MF A02

The series of projects described in this dissertation was stimulated by the discovery of high temperature superconductivity. Our goal was to develop useful applications which would be competitive with the current state of technology. The high-T(c) microbolometer was developed into the most sensitive direct detector of millimeter waves, when operated at liquid nitrogen temperatures. The thermal boundary resistance of thin YBa(2)Cu(3)O(7-delta) films was subsequently measured and provided direct evidence for the bolometric response of high-T(c) films to fast (ns) laser pulses. The low-T(c) microbolometer was developed and used to make the first direct measurements of the frequency dependent optical efficiency of planar lithographed antennas. The hot-electron microbolometer was invented less than a year prior to the writing of this dissertation. Our analysis, presented here, indicates that it should be possible to attain up to two orders of magnitude higher sensitivity than that of the best available direct detectors when operated at the same temperature. The temperature readout scheme for this device could also be used to measure the intrinsic interaction between electrons and phonons in a metal with a sensitivity that is five orders of magnitude better than in previous measurements. Preliminary measurements of quasiparticle trapping effects at the interface between a metal and a superconductor are also presented. DOE

ENHANCED REDUCTION OF VELOCITY DATA OBTAINED DURING CETA FLIGHT EXPERIMENT
Tom D. Finley, Douglas T. Wong, and John S. Tripp Washington May 1993 13 p
(RTOP 472-47-12-50)
(NASA-TM-4460; L-17168; NAS 1.15:4460) Avail: CASI HC A03/MF A01

A newly developed technique for enhanced data reduction provides an improved procedure that allows least squares minimization to become possible between data sets with an unequal number of data points. This technique was applied in the Crew and Equipment Translation Aid (CETA) experiment on the STS-37 Shuttle flight in April 1991 to obtain the velocity profile from the acceleration data. The new technique uses a least-squares method to estimate the initial conditions and calibration constants. These initial conditions are estimated by least-squares fitting the displacements indicated by the Hall-effect sensor data to the corresponding displacements obtained from integrating the acceleration data. The velocity and displacement profiles can then be recalculated from the corresponding acceleration data using the estimated parameters. This technique, which enables instantaneous velocities to be obtained from the test data instead of only average velocities at varying discrete times, offers more detailed velocity information, particularly during periods of large acceleration or deceleration. ITERATIVE ENCODING METHODS FOR COMPUTER GENERATED HOLOGRAMS Final Report, 1 Oct. 1991 - 30 Sep. 1992
Michael R. Feldman 8 Feb. 1993 4 p
(Contract DAAL03-91-G-0091)
(AD-A263705; ARO-28416.2-PH) Avail: CASI HC A01/MF A01

Iterative encoding methods capable of greatly increasing the performance of CGH's were investigated. An F/l holographic lens, designed with an iterative encoding method was measured to have a diffraction efficiency of 87%. This is the highest reported efficiency for an F/l element. A recursive Mean Squared Error Algorithm was developed to reduce the computation time. A hologram was fabricated to generate a 32x32 spot array. The experimental measurements indicated a diffraction efficiency of 72% and uniformity of + or -1%. This is the highest reported diffraction efficiency for such large-sized spot arrays. DTIC

TRANSIENT RESPONSE OF EMBEDDED THERMOCOUPLES
D. A. Coutts Nov. 1992 36 p Revised
(Contract DE-AC09-89SR-18035)
(DE93-009889; WSRC-TR-92-73-Rev-1) Avail: CASI HC A03/MF A01

There is an increasing interest in the ability to measure transient behavior in heated systems in the Heat Transfer Laboratory. To accomplish this, an understanding of transient instrument behavior is necessary. This report discusses the transient behavior of small diameter thermocouples which are imbedded in an aluminum plate and provides an estimate of the composite time constant for different imbedded arrangements. It also describes a technique which can be used to estimate the time constant. The primary purpose of the data presented in this report was to evaluate manufacturing, installation, and calibration techniques. Use of the data in this report for critical applications should be limited to generalizations of behavior and uncertainty analysis. DOE

The research reported was part of the Department of Defense Universities Research Initiative (URI) Program. Because of the heavy investment in planning, design, construction, maintenance, and operation of its huge physical plant, the U.S. Army included Advanced Construction Technology as one of the areas of concentration in the URI program. The research program consisted of 28 research projects conducted in the following five areas: nondestructive evaluation technologies for constructed works, construction site metrology, new materials and material technologies for construction, computer-aided construction, and special technologies. Accordingly, the research program was a multi-disciplinary program conducted by faculty and graduate students at the University of Illinois. DTIC

SCANNING PROBE LITHOGRAPHY. PART 1: SCANNING TUNNELING MICROSCOPE-INDUCED LITHOGRAPHY OF SELF-ASSEMBLED n-ALKANETHIOL MONOLAYER RESISTS Technical Report
Claudia B. Ross, Li Sun, and Richard M. Crooks 19 Mar. 1993 27 p
(Contract N00014-91-J-1991)
(AD-A263130; TR-5) Avail: CASI HC A03/MF A01

The tip of a scanning tunneling microscope was used to fabricate geometrically well structures within organized, self-assembled monolayer resist that have critical dimensions ranging from 60 nm to 5 micrometers. To achieve nanometer-scale lithography, a Au(111) substrate was coated with a self-assembled monolayer of HS(CH2)17CH3, which functions as an ultrathin (approx. 2.5 nm) resist, and then the resist was etched by an STM tip. This treatment results in window-like features that penetrate the organic monolayer. Nanolithographically defined features have been characterized by scanning tunneling microscopy, scanning electron microscopy, and electrochemical methods. For example, since mass and electron transfer to the conductive Au substrate are blocked by the monolayer everywhere except in the STM-etched regions, the windows serve as ultramicroelectrodes. The limiting current that results from radial diffusion of a bulk-phase redox species to the etched window is in close agreement with that predicted by theory. DTIC

VALVE MALFUNCTION DETECTION APPARATUS Patent
Richard K. Burley, inventor (to NASA) 13 Jul. 1993 6 p Filed 7 Oct. 1992
(NASA-Case-MFS-29904-1; US-Patent-5,226,447;
US-Patent-Appl-SN-957127; US-Patent-Class-137-554;
US-Patent-Class-137-557; US-Patent-Class-116-70;
US-Patent-Class-340-611; Int-Patent-Class-F16K-37/00) Avail: US Patent and Trademark Office

A detection system is provided for sensing a malfunction of a valve having an outlet connected to an end of a first pipe through which pressurized fluid may be flowed in a downstream direction away from the valve. The system includes a bypass pipe connected at its opposite ends to the first pipe and operative to bypass a portion of the fluid flow therethrough around a predetermined section thereof. A housing is interiorly divided by a flexible diaphragm into first and second opposite chambers which are respectively communicated with the first pipe section and the bypass pipe, the diaphragm being spring-biased toward the second chamber. The diaphragm housing cooperates with check valves and orifices connected in the two pipes to create and maintain a negative pressure in the first pipe section in response to closure of the valve during pressurized flow through the first pipe. A pressure switch senses the negative pressure and transmits a signal indicative thereof to a computer. Upon cessation of the signal while the valve is still closed, the computer responsively generates a signal indicating that the valve, or another portion of the detection system, is leaking. A NEW MULTICHANNEL SOFT X RAY FRAMING CAMERA FOR FUSION EXPERIMENTS
F. Ze, R. L. Kauffman, J. D. Kilkenny, J. Wielwald, P. M. Bell, R. Hanks, J. Stewart, D. Dean, J. Bower, and R. Wallace 20 Mar. 1992 14 p
Presented at the 9th Topical Conference on High-Temperature Plasma Diagnostics, Santa Fe, NM, 15-19 Mar. 1992
(Contract W-7405-eng-48)
(DE93-009302; UCRL-JC-110094; CONF-920362-43) Avail: CASI HC A03/MF A01

Two dimensional, time resolved x-ray imaging is a principal technique used to study hot plasmas produced in laser heated targets. It can be used to study laser energy deposition within the irradiation spot, the spatial and temporal dependence of laser to x-ray conversion efficiency, electron transport and density profiles, mass ablation rates as well as x-ray driven implosions in inertial confinement fusion experiments. A new soft x-ray framing camera which will allow us to record two-dimensional images at different times almost simultaneously was successfully developed. It is a broad band diagnostic (100 eV less than or equal to delta(h(radical)) less than or equal to 400 eV) having three channels which can obtain x-ray images at four different times from laser driven targets. Its current configuration includes one 500 eV, one 1.0 keV, and one approximately 2.5 keV channels. The two low energy channels resulted from pairing transmission filters to grazing x-ray mirrors. Other channel options can be implemented easily to measure other x-ray energies. Four different striplines coated on a microchannel plate are gated at different times. Each strip records three different images taken nearly simultaneously, one image per channel. The result is twelve x-ray images on film, four images per channel taken at four different times, with a nominal resolution of approximately 100 ps per image. The diagnostics' spatial resolution is approximately 10 microns. This new instrument was already fielded during x-ray conversion experiments, using both low and high Z targets driven by 1ns-2ns, 'flat top' laser pulses. The details of the instrument design and sample results from conversion experiments are shown. DOE

ADVANCED COORDINATE MEASURING MACHINE AT SANDIA NATIONAL LABORATORIES
R. D. Pilkey and P. A. Klevgard Mar. 1993 32 p
(Contract DE-AC04-76DR-00789)
(DE93-010618; SAND-93-8208) Avail: CASI HC A03/MF A01

Sandia National Laboratories/California has acquired a new Moore M-48V CNC five-axis universal coordinate measuring machine (CMM). Site preparation, acceptance testing, and initial performance results are discussed. Unique features of the machine include a ceramic ram and vacuum evacuated laser pathways (VELPS). The implementation of a VELPS system on the machine imposed certain design requirements and entailed certain start-up problems. The machine's projected capabilities, workload, and research possibilities are outlined. DOE

MEASUREMENT OF PROJECTILE SURFACE TEMPERATURE BY MEANS OF ITS INFRARED RADIATION: A PRELIMINARY STUDY Final Report, Jan. - Apr. 1992
Keith P. Soencksen Apr. 1993 32 p
(DA Proj. 1L1-61102-AH-43)
(AD-A264053; ARL-MR-62) Avail: CASI HC A03/MF A01

The current work is a preliminary study to the planned direct measurement of the infrared emissions of a projectile in flight, from which surface temperature will be estimated. If the planned experiment is to be meaningful, the projectile surface temperature must be high enough such that the incident infrared radiation is significant enough to be measured by the detectors. In this report, detector threshold is calculated and compared to the computed infrared radiation reaching the detector from an M735 projectile nosecone at a distance from the muzzle of 225 meters. In the wavelength band 2.0-2.5 microns, the results predict that the detector will not be able to see the projectile emissions, and in the wavelength band 3.5-4.0 microns, the results show probable detection of most of the projectile only if the flow is turbulent. A NEW TUBELESS NANOSECOND STREAK CAMERA BASED ON OPTICAL DEFLECTION AND DIRECT CCD IMAGING
C. C. Lai Dec. 1992 15 p Presented at the 20th International Congress on High Speed Photography and Photonics, Victoria, Ontario, 25-26 Sep. 1992
(Contract W-7405-eng-48)
(DE93-011893; UCRL-JC-109615; CONF-9209188-10) Avail: CASI HC A03/MF A01

A new optically deflected streaking camera with performance of nanosecond-range resolution, superior imaging quality, high signal detectability, and large format recording has been conceived and developed. Its construction is composed of an optomechanical deflector that deflects the line-shape image of spatial-distributed time-varying signals across the sensing surface of a cooled scientific two-dimensional CCD array with slow readout driving electronics, a lens assembly, and a desk-top computer for prompt digital data acquisition and processing. Its development utilizes the synergism of modern technologies in sensor, optical deflector, optics, and microcomputer. With laser light as signal carrier, the deflecting optics produces near diffraction-limited streak images resolving to a single pixel size of less than or = 25 microns. A 1kx1k-pixel array can thus provide a vast record of 1,000 digital data points along each spatial or temporal axis. Since only one photon-to-electron conversion exists in the entire signal recording path, the camera responses linearly to the incident light over a wide dynamic range in excess of 10(exp 4):1. Various image deflection techniques are assessed for imaging fidelity, deflection speed, and capacity for external triggering. Innovative multiple-pass deflection methods for utilizing optomechanical deflector have been conceived and developed to attain multi-fold amplification for the optical scanning speed across the CCD surface at a given angular deflector speed. Without significantly compromising imaging. quality, or flux throughput efficiency, these optical methods enable a sub-10 ns/pixel streak speed with the deflector moving benignly at less than 500 radians/second, or equivalently 80 revolutions/second. Test results of the prototype performance are summarized including a spatial resolution of 10 lp/mm at 65% CTF and a temporal resolution of 11.4 ns at 3.8 ns/pixel. DOE

PORTABLE FIBER OPTIC COUPLED DOPPLER INTERFEROMETER SYSTEM FOR DETONATION AND SHOCK WAVE DIAGNOSTICS
K. J. Fleming 1993 7 p Presented at the 6th Test Technology Symposium, Baltimore, MD, 30 Mar. 1993
(Contract DE-AC04-76DP-00789)
(DE93-009827; SAND-93-0712C; CONF-9303128-1) Avail: CASI HC A02/MF A01

Testing and analysis of shock wave characteristics such as produced by detonators and ground shock propagation frequently require a method of measuring velocity and displacement of the surface of interest. One method of measurement is doppler interferometry. The VISAR (Velocity Interferometer System for Any Reflector) uses doppler interferometry and has pined wide acceptance as the preferred tool for shock measurement. An important asset of VISAR is that it measures velocity and displacement non-intrusively. The conventional VISAR is not well suited for portability because of its sensitive components, large power and cooling requirements, and hazardous laser beam. A new VISAR using the latest technology in solid state lasers and detectors was developed and tested. To further enhance this system's versatility, the unit is fiber optic coupled which allows remote testing, permitting the VISAR to be placed over a kilometer away from the target being measured. Because the laser light is contained in the fiber optic, operation of the system around personnel is far less hazardous. A software package for data reduction was also developed for use with a personal computer. These new advances have produced a very versatile system with full portability which can be totally powered by batteries or a small generator. The solid state VISAR and its peripheral components, fiber optic coupling methods, and the fiber optic coupled sensors used for sending and receiving laser radiation is described. DOE

THE X RAY MICROSCOPY RESOURCE CENTER AT THE ADVANCED LIGHT SOURCE
W. Meyer-Ilse, D. Attwood, and M. Koike Aug. 1992 12 p Presented at the 4th International Conference on Biophysics and Synchrotron Radiation, Tsukuba, Japan, 30 Aug. - 5 Sep. 1992
(Contract DE-AC03-76SF-00098)
(DE93-010443; LBL-32367; CONF-920821-3) Avail: CASI HC A03/MF A01

The high spectral brightness of undulator radiation from the Advanced Light Source (ALS) offers a great scientific opportunity for biological x-ray microscopy. X-ray microscopy extends visible light microscopy to higher resolution and makes use of unique contrast mechanisms. It does not compete with techniques such as electron microscopy in terms of resolution, but rather offers unique advantages, including the opportunity to take images of samples in an aqueous environment. For a considerable range of resolution and sample thickness the radiation dose in x-ray microscopy is lower than in electron microscopy under the same imaging conditions. To exploit this opportunity a Biological X-ray Microscopy Resource Center will be built at the ALS. An x-ray microscope (XM) and a scanning x-ray microscope (SXM) are to be built. These two microscopes serve complementary needs. The XM gives high quality images at comparably short exposure times, while the SXM is optimized for low radiation dose. High resolution is accomplished in both microscopes with Fresnel zone plate lenses. The SXM produces a diffraction-limited focus point, which is scanned across the sample; therefore the SXM can use only the spatially coherent portion of the radiation. The SXM is best operated on an undulator source with its small phase space. An XM can use the full brightness, including the incoherent fraction of the source. It can be operated with either a bending magnet or an undulator source. The XM can be installed initially at a bending magnet, which can be available at an earlier time, and thus permits the development of diverse biological community at an earlier time. Later this XM can be moved to the undulator, or left at the bending magnet for developmental and less demanding experiments. DOE

THE USE OF DFT WINDOWS IN SIGNAL-TO-NOISE RATIO AND HARMONIC DISTORTION COMPUTATIONS
O. M. Solomon, Jr. 1993 10 p Presented at the Instrumentation and Measurement Technology Conference, Irvine, CA, 18-20 May 1993
(Contract DE-AC04-76DP-00789)
(DE93-009800; SAND-93-0518C; CONF-930577-1) Avail: CASI HC A02/MF A01

The discrete Fourier transform (DFT) is frequently used in the computation of the signal-to-noise ratio (SNR) and harmonic distortion. To estimate the SNR or harmonic distortion, a sine wave is applied to the digitizing system under test. When the data record contains an integer number of cycles of the sine wave, energy from the sine wave and its harmonics does not leak into adjacent DFT frequency bins. Each harmonic occupies one and only one DFT frequency bin. To find the root-mean-square (RMS) value of a harmonic from its DFT, one computes the magnitude of the DFT value at the single frequency of the harmonic. When the DFT's of the fundamental and its harmonics are single lines, the SNR and harmonic distortion are easy to compute. When the data record contains a non-integer number of cycles of the sine wave, energy leaks from the sine wave and its harmonics to adjacent frequencies. The literature contains several approaches to the problem of determining which DFT components correspond to a sine wave harmonic. This paper describes how to estimate the RMS value of a sine wave from its DFT with special attention to the selection of the DFT window. The set of DFT frequencies which comprise a harmonic depends on the DFT window, the length of the DFT, and the number of bits of the digitizer. Criteria are developed for choosing the DFT frequencies that correspond to a sine wave. These criteria lead to better choices of DFT windows for SNR and harmonic distortion calculations. DOE

This document, the Preliminary Design Report (PDR) for the Brookhaven Ultraviolet Free Electron Laser (UV FEL) facility, describes all the elements of a facility proposed to meet the needs of a research community which requires ultraviolet sources not currently available as laboratory based lasers. Further, for these experiments, the requisite properties are not extant in either the existing second or upcoming third generation synchrotron light sources. This document is the result of our effort at BNL to identify potential users, determine the requirements of their experiments, and to design a facility which can not only satisfy the existing need, but have adequate flexibility for possible future extensions as need dictates and as evolving technology allows. The PDR is comprised of three volumes. In this, the first volume, background for the development of the proposal is given, including descriptions of the UV FEL facility, and representative examples of the science it was designed to perform. Discussion of the limitations and potential directions for growth are also included. A detailed description of the facility design is then provided, which addresses the accelerator, optical, and experimental systems. Information regarding the conventional construction for the facility is contained in an addendum to volume one (IA). DOE

INFLUENCE OF OPTICAL FEEDBACK ON THE PULSE BEHAVIOR OF SEMICONDUCTOR LASERS Ph.D. Thesis [EINFLUSS OPTISCHER RUECKWIRKUNG AUF DAS PULSVERHALTEN VON HALBLEITERLASERN]
Jianmin Wang 1992 132 p In GERMAN
(ETN-93-93798) Avail: CASI HC A07/MF A02

The influence of optical feedback and dispersion on the intensity noise of modulated laser diodes and their effect on optical transmission systems is studied in order to establish if laser diodes can be used in the coherence collapse area to be implemented in pulse code modulation transmission systems. A numerical process was developed to simulate the relative intensity noise of the single mode laser diode, which was shown to be worsened by jitter and overoscillations due to laser diode modulation, which can be reduced with a high relaxation frequency. A similar behavior was observed in the transition to coherence collapse area and it was noticed that at high reflection level the relative intensity noise is so important that jitter and overrelation can be neglected. A model was developed for calculation of laser diode noise on coherence collapse area, so that intensity and frequency noise and line width of laser diodes could be analytically obtained. It was established that relaxation oscillation damping is increased by optical feedback and reflection sensitivity is reduced by growing line width. ESA

ALL SOLID-STATE HIGH POWER VISIBLE LASER Final Report, 22 May 1991 - 22 May 1993
William M. Grossman 16 Jun. 1993 92 p Original contains color illustrations
(Contract NAS7-1145)
(NASA-CR-193163; NAS 1.26:193163) Avail: CASI HC A05/MF A01; 6 functional color pages

The overall objective of this Phase 2 effort was to develop and deliver to NASA a high repetition rate laser-diode-pumped solid-state pulsed laser system with output in the green portion of the spectrum. The laser is for use in data communications, and high efficiency, short pulses, and low timing jitter are important features. A short-pulse 1 micron laser oscillator, a new multi-pass amplifier to boost the infrared power, and a frequency doubler to take the amplified infrared pulsed laser light into the green. This produced 1.5 W of light in the visible at a pulse repetition rate of 20 kHz in the laboratory. The pulses have a full-width at half maximum of near 1 ns. The results of this program are being commercialized. Author (revised)

LASER SPECTROSCOPY OF HYDROCARBON RADICALS
1993 8 p
(Contract DE-FG02-90ER-14132)
(DE93-012555; DOE/ER-14132/3) Avail: CASI HC A02/MF A01

Several hydrocarbon reactive intermediates (carbenes, biradicals, etc.) were prepared in a supersonic jet expansion. Heats of formation were determined for the isomeric C_3H_2 carbenes. Fits were made to the photoelectron spectra of c-C_3H_2 and c-C_4H_4. Resonant MPI spectra were obtained for allyl radical and its deuterated isotopomers. DOE

A TECHNIQUE FOR SINGLE-PULSE SPECTRUM AND PULSE WIDTH MEASUREMENTS FOR AN IR-FEL
W. P. Leemans, J. A. Edighoffer, K. J. Kim, S. Chattopadhyay, and H. A. Schwettman (Stanford Univ., CA.) Aug. 1992 14 p Presented at the 14th International Free Electron Laser Conference, Kobe, Japan, 23-28 Aug. 1992
(Contract DE-AC03-76SF-00098)
(DE93-007732; LBL-32284; ESG-188; CONF-9208142-20) Avail: CASI HC A03/MF A01

A diagnostic system has been designed to measure the spectrum and pulse width of infrared FEL pulses. Use of an image dissector and a single element high speed detector with integrating sphere, allows one to obtain spectral or temporal information for each individual micro-pulse inside the pulse train. The spectral diagnostic consists of a mode matching telescope, a high resolution spectrometer, an imaging telescope, and an image dissector system. The imaging telescope between the spectrograph and the image dissector provides for variable magnification (and hence resolution) of the spectrum onto the image dissector. The pulse width measurement uses single pulse autocorrelation through non-collinear optical mixing in a frequency doubling crystal, an imaging telescope, and again an image dissector system. Here, the imaging telescope relays the image of the region in the nonlinear crystal in which second harmonic light was generated onto the image dissector. The design and implementation of these diagnostics for the 1-11 microns on the IR-FEL at Stanford University are discussed. DOE

SMART SKIN STRUCTURES FOR IDENTIFYING AND LOCATING LASER IRRADIATION
P. C. LaDelfe, R. M. Goeller, and H. S. Murray 1992 11 p Presented at the SPIE 1993 North American Conference on Smart Structures and Materials, Albuquerque, NM, 1-4 Feb. 1992
(Contract W-7405-eng-36)
(DE93-005464; LA-UR-92-4353; CONF-9202154-1) Avail: CASI HC A03/MF A01

A pyramidal arrangement of wavelength-selective optical detectors can be used to determine the identity (wavelength), intensity, and direction-of-arrival of laser irradiation. The advantages of this technique are that only unobtrusive, skin-like structures are required and that large collection areas provide high sensitivity. The disadvantage is that the angular resolution (approximately 5 degrees in a 60 degree field-of-view) is less than that which can be achieved using methods requiring thicker structures. The detector elements are large-area, polyvinylidine fluoride, pyroelectric devices with wavelength selective coatings. Four identical arrays of these elements are situated on the top and sides of a frustrated, three-sided prism. Since only the relative orientations are significant, these faces can be selected regions on the surface of an existing structure. We first describe the construction of the detectors and the system, then develop the mathematical description of the system. Using coated detectors whose performance has been experimentally verified, we will model the response to in-channel, monochromatic irradiation and then describe the data analysis algorithm. Although we will limit our model to a simple, two-channel system, the concept and algorithm can easily be extended to a system of any reasonable number of nonoverlapping channels. DOE

DEVELOPMENT OF HIGH POWER MICROWAVE SOURCE
Shoichi Ono (Tohoku Univ., Sendai, Japan.) Apr. 1992 42 p
(DE93-753316; NIFS-MEMO-6) Avail: CASI HC A03/MF A01

To achieve thermonuclear fusion it is inevitable to develop high power microwave and millimeter wave sources for plasma heating. In 1990, working group was organized as a collaboration study in National Institute for Fusion Science to review the present status of development on high microwave source. The review of development on high power klystron and gyrotron, FEL and microwave power source by REB is reported. Development of high power klystron is almost finished except for cooling of the window, cavity, and collector. As for the gyrotron oscillating with the whispering gallery mode, one must overcome the same problem for CW operation. In the quasi-optical gyrotron, there is no special progress for increasing the frequency and efficiency. Though the experimental evidence on autoresonance in the development of peniotron is performed, output power and frequency is much smaller than that of the gyrotron. It is difficult to increase in the pulse width of FEL having giant power of GW level with several ten ns and the utilization for plasma heating is limited. In addition, microwave and millimeter wave oscillators with high power which are running in the laboratories and the institutes are summarized. DOE

Laser system performance and reliability depends on the related performance and reliability of the optical components which define the cavity and transport subsystems. High-average-power and long transport lengths impose specific requirements on component performance. The complexity of the manufacturing process for optical components requires a high degree of process control and verification. Qualification has proven effective in ensuring confidence in the procurement process for these optical components. Issues related to component reliability have been studied and provide useful information to better understand the long term performance and reliability of the laser system. DOE

Proposed x-ray laser applications such as interferometry and holography require coherent radiation. The fact that x-ray laser media are short-lived, high-temperature plasmas leads to very different coherence properties from those of ordinary lasers. Research aimed at developing theoretical models and experimentally characterizing and improving x-ray laser coherence is discussed. Longitudinal coherence is already sufficient for several applications due to the narrow linewidths. However, transverse coherence is estimated to be poor for most current x-ray lasers. To quantify these estimates and to design better lasers, both wave and geometric optics propagation and coherence theories have been developed. These theories and resulting predictions of the coherence length are presented and compared. Measurements of x-ray laser beampatterns and coherence lengths are presented and compared to detailed theoretical simulations. Designs for more coherent lasers are given. DOE

LOW-PUMP-RATE MULTI-MILLISECOND ATOMIC XENON LASER
E. L. Patterson and G. E. Samlin Feb. 1993 26 p
(Contract DE-AC04-76DP-00789)
(DE93-011484; SAND-93-0057) Avail: CASI HC A03/MF A01

Characteristics of a long pulse, low-pump rate, atomic xenon (Xe I) laser are described. Energy loading up to 170 mJ/cc at pulse widths between 5 and 55 ms is achieved with an electron beam in transverse geometry. The small-signal gain coefficient, loss coefficient, and saturation intensity are inferred from a modified Rigrod analysis. For pump rates between 12 and 42 W/cc the small-signal gain coefficient varies between 0.64 and 0.91%/cm, the loss coefficient varies between 0.027 and 0.088%/cm, and the saturation intensity varies between 61 and 381 W/cm(sup 2). Laser energy as a function of pulse width and the effects of air and CO2 impurities are described. The intrinsic laser energy efficiency has a maximum at a pulse width of 10 ms corresponding to a pump rate of 1.6 W/cc. No maximum is observed in the intrinsic power efficiency. A drastic reduction of laser output power is observed for impurity concentrations of greater than (approx)0.01%. An investigation of the dominant laser wavelength in a high Q cavity indicates that the 2.6-(mu)m radiation dominates. A comparison of dominant wavelength with reactor pumped results indicates good agreement when the same cavity optics are used. DOE

ND LASER WITH CO-DOPED ION(S) PUMPED BY VISIBLE LASER DIODES Patent
Richard Scheps, inventor (to Navy) 6 Apr. 1993 11 p Filed 17 Jun. 1991
(AD-D015711; US-Patent-5,200,972; US-Patent-Appl-SN-718316;
US-Patent-Class-372-69) Avail: US Patent and Trademark Office

The 1.06 microns Nd transition in a co-doped Cr,Nd:Gd3Sc2Ga3O12 (Cr,Nd:GSGG) gain element is obtained by diode pumping Cr(3+) at 670 run and produces efficient, low threshold laser operation. Although co-doped

Cr,Nd:GSGG was developed for more efficient flashlamp pumping, it has the desirable property of having an extraordinarily broad absorption to allow for efficient diode pumping relative to the ND:YAG laser. The consequent broad bandwidth tolerance of the Cr,Nd:GSGG for the diode pumping radiation allows diode pumping of the 1.06 microns transition without regard to the wavelength of the visible diodes which has the potential for reducing the cost of the semiconductor pump and also demonstrates the extended versatility of these diodes which previously had been restricted to pump the Cr(3+) tunable vibronic lasers. CW and long pulse diode pumping provided pump power levels as high as 300 mW CW and 1 W pulsed. The lowest threshold power was measured at 938 micron W and the highest output power was obtained at 43 mW CW and 173 mW pulsed. The best slope efficiency obtained was 42.1%, 78% of the theoretical maximum. Loss measurements indicate a value of 0.4%/cm. DTIC

Current x-ray lasers operate in the 35 to 500 A wavelength regimes with 21.5 A being the limit for the successful collisional excitation approach using Nickel-like ions. In this paper, we discuss an x-ray laser scheme in the 5 to 15 A regime. The scheme uses an ultra-short (100 fsec FWHM) intense (10(exp 17) Watts/sq cm) laser pulse to produce a hot plasma at a laser line focus. This plasma serves as an x-ray source that photo-ionizes the K shell of a nearby concentration of lasant atoms. This produces a population inversion, and resulting positive gain for an allowed 2p-1s radiative transition in the singly charged ion. This x-ray laser scheme has been studied for a number of years with some recent work by Kapteyn. There are three major differences between this work and that of Kapteyn. First, a two temperature black body is used in the kinetic calculation to model the ionizing spectrum as compared to a single temperature model Second, the modeled spectrum is obtained directly from simulations of the x-ray source using a target material with x-ray spectra matched to the particular lasant material. Third, the effect of excitation in hydrogen, which is added to the lasant material to slow down energetic electrons, is included in addition to the effect of ionization of hydrogen discussed by Kapteyn. Clarence P. Cain and Gary D. Noojin Jan. 1993 30 p
(Contract F33615-88-C-0631)
(AD-A262016; AL-TR-1992-0113) Avail: CASI HC A03/MF A01

Special instrumentation is required to measure and analyze laser pulses below one nanosecond because of the limitations of standard instrumentation used to measure real-time signals. We have designed and developed an instrument with unique features to measure the pulsewidth of single laser pulses below one nanosecond using the standard autocorrelation technique. A single laser pulse is divided into two equal pulses by a 50/50 beamsplitter and recombined in space and in time inside a wafer of KDP crystal which generates a second harmonic of the combined pulses. These three pulses are then focused on a charge-coupled device (CCD) camera and analyzed by a laser beam analyzer to yield information on the FWHM (full-width-half-maximum) time of the original pulse. By using a CCD camera, the full two-dimensional image can be recorded to insure that the correct horizontal profile is analyzed within the vertical profile. The delay for overlapping the beams in time is obtained by translating the beamsplitter while the positioning is obtained by rotating the beamsplitter. The design and results are discussed. DTIC

PROBLEMS IN THE IMPLEMENTATION OF X RAY OPTICS WITH X RAY LASERS
B. J. MacGowan, S. Mrowka, T. W. Barbee, Jr., L. B. DaSilva, D. C. Eder, J. A. Koch, and J. H. Underwood (California Univ., Berkeley. Lawrence Berkeley Lab.) 22 Jul. 1992 8 p Presented at the 3rd International Colloquium on X Ray Lasers, Schliersee, Germany, 18-22 May 1992
(Contract W-7405-eng-48)
(DE93-009297; UCRL-JC-111376; CONF-920523-8) Avail: CASI HC A02/MF A01

When using multilayer mirrors in x-ray laser cavities, damage from intense optical and x-ray pulses, is a major problem. X-ray damage to WC-/C and Cr3C2/C multilayer mirrors has been studied using short pulses (500 psec) of soft x-rays from a laser produced plasma. The effect of damage on the mirror reflectivity and position and shape of the bandpass were resolved temporally and spectrally. Simulations of the behavior of the mirrors are found to be broadly consistent with the observed damage thresholds. DOE

INVESTIGATIONS OF SELF-PUMPED PHASE CONJUGATE LASER BEAMS AND COHERENCE LENGTH M.S. Thesis
George M. Sutton Mar. 1993 54 p
(AD-A263438) Avail: CASI HC A04/MF A01

The phase conjugation process by a nonlinear, photorefractive crystal is not completely ideal and losses should be expected to occur after a beam is conjugated. This thesis research investigates possible changes in coherence length as a result of internal losses in barium titanate (BaTiO3). Additionally, laser reflections from a corner cube reflector is also examined for changes in coherence length. Experimental findings are inconclusive because the conventional spectrometer used to measure coherence length did not possess the required resolution. It is recommended that an interferometer which can resolve the laser line width be utilized for future coherence length measurements, together with a means of blocking the conjugated beam from entering the laser cavity and destabilizing the oscillations within. The army uses nitrated compounds as explosives and propellants.

There is a special need for propellants with the chemical composition necessary to burn exactly with high energy production, but with a minimum of side products which create smoke. Laser-induced chemistry possesses the potential to drive some reactions in an efficient and selective manner, and may be useful in driving nitration reactions toward specific products. Reported here are the results of several successful attempts to laser-induce the reactions of nitrogen oxides with three cycloalkanes. Specifically, the tunable, continuous wave, carbon dioxide infrared laser was used to drive the reaction between the nitrogen dioxide and cyclopropane, cyclobutane, and cyclopentane under a variety of reaction conditions. The spectrochemical analyses of the product mixtures are presented here. In addition to nitrocycloalkanes, other products resulting were either from ring cleavage, or from nitration or oxidation of ring fragments. By examining the effects of various reaction conditions on the product arrays, it was possible to find optimum conditions for producing the nitrocycloalkanes while minimizing side products. High peak power infrared pulses as short as 350 femtoseconds were generated using the MK 3 FEL. Small signal analyses were developed for operating the FEL with electron pulses whose energy varies linearly with time. Chirped-pulse simulations using modest energy chirps have demonstrated a x15 compression ratio at saturated power levels for 3.4 ps optical pulses at 3.35 microns, and coupled pulse simulations have indicated substantial longitudinal mode reduction on microsecond time scales. A Michelson mirror resonator was operated for the first time on the MK 3 FEL, along with phase-locked operation using a beamsplitter reflectance of only 1.4%. DTIC

MAGNETIC FIELD MEASUREMENTS OF THE CEBAF (NIST) WIGGLER USING THE PULSED WIRE METHOD M.S. Thesis
Stephen M. Wallace Sep. 1992 51 p
(AD-A263997) Avail: CASI HC A04/MF A01

The Free Electron Laser (FEL) has proven to be a versatile photon source for many applications in science, industry, and defense. It is capable of providing wide tunability and high efficiency, but has yet to yield high average power required as a weapon system. The proposed infrared and ultraviolet FELs at the Continuous Electron Beam Accelerator Facility (CEBAF) have been projected to provide high average power. The first section of this thesis will study the necessity of a FEL for shipboard defense, and state the advantages over other defense systems. The remainder will focus on use of the pulsed wire method for measuring the magnetic field errors of the CEBAF/National Institute of Science and Technology (NIST) wiggler. Data analysis indicates the wiggler will have a net electron beam deflection of x = 5.2 mm, which is much greater than the electron beam radius of re = 0.4 mm and the optical mode waist of wo = 1 mm. DTIC

The optical field in free electron lasers can sometimes develop sidebands and exhibit very complex behavior. The purpose of this report is to develop a two mode model of the optical field in a free electron laser in which the optical modes are coupled by the free electrons in the laser. This model may be used to study the long term stability of the optical wave and the development of sidebands in the optical field. In this report, the equations of motion governing the interaction of an electron with the optical modes will be derived. DTIC

FEMTOSECOND LASER STUDIES OF EXCITED STATE DYNAMICS Final Report, 1 Jun. 1990 - 31 Mar. 1993
Peter P. Sorokin and J. H. Glownia Mar. 1993 15 p
(Contract DAAL03-90-C-0006)
(AD-A263708; ARO-27508.9-PH) Avail: CASI HC A03/MF A01

Considerable progress has been made in the two main (and interrelated) areas in which the recent research has been focussed. These are (1) the development of novel, intense, femtosecond time-scale, VUV laser sources, and (2) the development of femtosecond time-scale, transition-state absorption spectroscopy of photodissociating gas-phase molecules. In both of these areas, some trails have been blazed that will undoubtedly soon be followed by others. A third area of investigation was to examine the possibility of two-photon amplification in the molecular system diphenyl hexatriene (DPH). Here the critical experiment still remains to be done. However, researchers were able to show that DPH does satisfy one stringent requirement for a potential two-photon amplifying system, namely, that it be completely stable against one-photon lasing under conditions of very heavy optical pumping. NONEQUILIBRIUM SCREENING AND EXCITON DYNAMICS PROBED BY FEMTOSECOND LASER PULSES Final Report, 15 May 1989 - 14 Nov. 1992
N. Peyghambarian and S. W. Koch 15 Feb. 1993 74 p
(Contract DAAL03-89-K-0100)
(AD-A263603; ARO-26974.15-PH) Avail: CASI HC A04/MF A01

Our efforts were aimed at the study of nonequilibrium properties of a high-density electron-hole-pair system, which was generated resonantly by femtosecond laser excitation. The investigation consisted of joint theoretical and experimental approaches. Using state of the art femtosecond experimental techniques, we studied extremely rapid physical phenomena. We have succeeded not only in completing the proposed tasks, but have also initiated some new projects and obtained very interesting results. During the last three years in this program, we have published three physical Review Letters, nine Physical Reviews, several other papers in good journals such as Appl. Phys. Lett., J. Opt. Soc. Am., etc., nineteen invited presentations at important conferences, and several contributed papers at international conferences. The list of publications is given in the next section. Here, we summarize the highlights of our achievements during the last three years of this contract. DTIC

SIRIUS-P: AN INERTIALLY CONFINED DIRECT DRIVE LASER FUSION POWER REACTOR
I. N. Sviatoslavsky, G. L. Kulcinski, G. A. Moses, D. Bruggink, R. L. Engelstad, H. Y. Khater, E. M. Larsen, E. G. Lovell, J. J. MacFarlane, and E. A. Mogahed et al Mar. 1993 297 p
(Contract DE-AS03-88DP-10754)
(DE93-012433; DOE/DP-10754/1) Avail: CASI HC A13/MF A03

The SIRIUS-P conceptual design study is of a 1000 MWe laser driven inertial confinement fusion power reactor utilizing near symmetric illumination of direct drive targets. The reference driver is a KrF laser; however, any other laser capable of delivering short wavelength energy can be substituted. Sixty beams providing a total of 3.4 MJ of energy are used at a repetition rate of 6.7 Hz and a target gain of 118. The spherical chamber has an internal diameter of 6.5 m and consists of two independent components, a first wall assembly fabricated from a c/c composite and a blanket assembly made of SiC. First wall protection is provided by a xenon buffer gas at a pressure of 0.5 torr. The chamber is cooled by a flowing granular bed of solid ceramic material, TiO2 for the first wall assembly and Li2O for the blanket assembly. The chamber is housed within a 42 m radius cylindrical reactor building which is 86 m high and which shares the same vacuum space as the chamber. All the laser beams are brought in at the bottom of the building, first onto a dielectrically coated final focusing mirror and finally onto a metallic grazing incidence mirror which reflects them into the chamber through beam ports open to the building. Neutron traps behind the grazing incidence mirrors are used to prolong the lifetimes of the final focusing optics. The nominal cost of electricity from this system is 65 mills/kwh assuming an 8% interest rate on capital. DOE

HIGH-REPETITION RATE X RAY LASERS AND APPLICATIONS

D. C. Eder, P. Amendt, C. B. Dane, L. B. DaSilva, L. A. Hackel, M. R. Hermann, R. A. London, B. J. MacGowan, D. L. Matthews, and M. D. Rosen et al Feb. 1993 6 p Presented at the 1992 International Conference on Lasers, Houston, TX, 7-11 Dec. 1992
(Contract W-7405-eng-48)
(DE93-011882; UCRL-JC-110878; CONF-921256-3) Avail: CASI HC A02/MF A01

The unique attributes of high repetition rate x-ray lasers can aid in the understanding of the structure and chemistry of free clusters, dynamical processes such as chemical reactions in surface layers, and general material properties studied with pump/probe techniques. Standard x-ray sources such as synchrotrons and laser plasmas are inadequate in many situations because of the quasi-continuous temporal output property of synchrotrons and the large bandwidth associated with plasma sources. Two approaches to achieving high repetition rate x-ray lasers are presented. The first utilizes conventional x-ray lasers combined with new high repetition rate optical drivers. The second is based on rapid recombination following field ionization of a plasma by a high-intensity short-pulse driving laser. Applications appropriate for each of these approaches are discussed. RESEARCH STUDIES ON SHORT WAVELENGTH BY SELECTIVE AUGER PROCESSES Final Technical Report

S. E. Harris Jan. 1993 10 p
(Contract N00014-87-K-2016)
(AD-A264493) Avail: CASI HC A02/MF A01

Efforts are divided into two areas: (1) development of short wavelength coherent sources, and (2) studies of lasers without inversion. In the first area, gain in the vacuum ultraviolet (VUV) and extreme ultraviolet (XUV) was observed in Xe, Zn, Kr, Cs, and H2 gases. Methods for saturating the laser transitions in Xe and Cs were developed and produced microjoule level fully saturated outputs at 109 nm and 96.9 nm, respectively. Efforts to construct the next generation laser driver for such studies were also completed during this time period. In the second area, theoretical studies of different methods for creating transparency in atomic vapors were explored. Various applications of these transparencies were investigated, including the possibility of systems which would exhibit laser gain without the necessity for population inversion and the enhancement of nonlinear optical processes in the presence of such a transparency. Experiments demonstrated enhanced sum-frequency generation of 104.8-nm radiation with a naturally occurring transparency in Zn vapor. DTIC

TUNABLE CW DIODE-PUMPED Tm,Ho:YLiF4 LASER OPERATING AT OR NEAR ROOM TEMPERATURE Patent Application

Brendan T. McGuckin, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) and Robert T. Menzies, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 30 Mar. 1993 29 p
(Contract NAS7-918)
(NASA-Case-NPO-18611-1-CU; NAS 1.71:NPO-18611-1-CU; US-Patent-Appl-SN-044668) Avail: CASI HC A03/MF A01

A conversion efficiency of 42 percent and slope efficiency of 60 percent relative to absorbed pump power are obtained from a continuous wave diode-pumped Tm,Ho:YLiF4 laser at 2 microns with output power of 84mW at a crystal temperature of 275K. The emission spectrum is etalon tunable over a range of 7nm (16.3 cm(sup -1) centered on 2.067 microns with fine tuning capability of the transition frequency with crystal temperature at a measured rate of -0.03/(cm)K. The effective emission cross-section is measured to be 5 x 10(sup -21) cm squared. These and other aspects of the laser performance are disclosed in the context of calculated atmospheric absorption characteristics in this spectral region and potential use in remote sensing applications. Single frequency output and frequency stabilization are achieved using an intracavity etalon in conjunction with an external reference etalon. NASA

HOLMIUM QUASI-TWO LEVEL LASER Patent Application

Steven R. Bowman, inventor (to Navy) and Barry J. Feldman, inventor (to Navy) 30 Dec. 1992 33 p
(AD-D015706; US-Patent-Appl-SN-998347; Navy-Case-74205) Avail: CASI HC A03/MF A01

According to the invention, a directly pumped holmium quasi-two level laser is provided which affords a number of important advantage over sensitized holmium lasers. These advantages include reducing the thermal loading of the laser medium, reducing the upconversion losses, increasing the short pulse extraction efficiency, reducing the sensitivity of the gain provided to temperature effects, and increasing the flexibility in the selection of holmium ion concentrations and holmium host materials. In accordance with the invention, a laser system or device is provided which comprises a holmium laser having an output wavelength of 2.1 micrometers and a further, pumping laser having an output wavelength of 2.0 micrometers for directly pumping the holmium laser. EXPERIMENTAL TEST OF HOLE-COUPLED FEL RESONATOR DESIGNS USING A CW-HeNe LASER

W. P. Leemans, E. W. Wallace, M. Xie, and K. J. Kim Jan. 1993 8 p Presented at the OE/LASE 1993 International Society for Optical Engineering Conference, Los Angeles, CA, 16-23 Jan. 1993
(Contract DE-AC03-76SF-00098)
(DE93-010439; LBL-33603; ESG-246; CONF-930159-20) Avail: CASI HC A02/MF A01

We report on ongoing experiments and simulations which model the performance of hole-coupled resonators. We have previously studied a hole-coupled resonator which was well inside the stable region (stability parameter g = -0.8). In the far field, good agreement between experiment and simulation was obtained for both the intracavity and outcoupled mode-profile. The present study involves a resonator with a stability parameter of -0.987, identical to the stability parameter of the proposed Infrared Free Electron Laser (IRFEL) at Lawrence Berkeley Laboratory. The experiments were carried out with a frequency stabilized CW-HeNe laser beam at a wavelength of 632.8 nm. Both intracavity and outcoupled mode profiles and power levels were measured. The simulations were done using the code HOLD, which is based on the Fresnel approximation for the Huygens kernel. Within the experimental uncertainties, magnified due to the 1/(1+g) dependence of the mode characteristics on errors in measured resonator parameters, we have obtained fair agreement between experiment and simulation. UPLINK LASER PROPAGATION MEASUREMENTS THROUGH THE SEA SURFACE, HAZE AND CLOUDS

G. T. Kaye, Roger Nies, and Michael Lovern Mar. 1993 14 p
(AD-A264687) Avail: CASI HC A03/MF A01

An Airborne Optical Receiver (AOR) was developed and tested to investigate the propagation and reception of optical communications uplinks from a submerged laser source to an overflying fleet aircraft. The AOR was flown in a P-3C Orion aircraft for an at-sea test off the southern California coast in August, 1990. A green laser transmitter was suspended from the Research Platform FLIP at depths of 15 to 45 m. During six nights of operations, the AOR received the laser light at various test geometries and through clear and cloudy conditions. This represents the first optical uplink cloud experiment at visible wavelengths. Results show that optical pulses in clouds are significantly more forward-scattered than modeled. The results can be explained by Mie scattering theory. Measured cloud attenuation and pulse stretching agreed with an existing optical propagation model. Significant attenuation and signal spreading due to haze and fog was measured and compared with theory. DTIC

INTRACAVITY-PUMPED 2.1 MICROMETER Ho(3+): YAG LASER Patent Application
Leon Esterowitz, inventor (to Navy) and Robert S. Stoneman, inventor (to Navy) 30 Dec. 1992 23 p
(AD-D015728; US-Patent-Appl-SN-998348; Navy-Case-74075) Avail: CASI HC A03/MF A01

In a preferred embodiment, a Tm(3+):YAG laser crystal and a Ho(3+):YAG laser crystal are placed within a reflective path of a laser cavity for intracavity pumping the Ho(3+):YAG laser crystal. The Tm(3+):YAG laser crystal emits a substantially 2.0 micrometers laser emission after being resonantly end-pumped by a pump beam at a wavelength of about 785 nm and the substantially 2.0 micrometers laser emission is used to pump the Ho(3+): YAG laser crystal. The intracavity-pumped Ho(3+):YAG laser crystal emits an output laser emission at substantially 2.1 micrometers. The slope efficiency of the Ho(3+):YAG laser crystal output power is about 40% of the pump power absorbed by the Tm(3+):YAG laser crystal. DTIC

A VARIABLE REFLECTIVITY OUTPUT COUPLER FOR OPTICALLY PUMPED FAR INFRARED LASERS
U. U. Graf (Texas Univ., Austin.), A. I. Harris, J. Stutzki (Cologne Univ., Germany.), and R. Genzel Jun. 1992 9 p Submitted for publication
(MPE-Preprint-225; ETN-93-93937) Copyright Avail: Fachinformationszentrum Karlsruhe, 7514 Leopoldshafen-Eggenstein 2, Germany

The design and performance of a variable reflectivity output coupler for optically pumped far infrared lasers are investigated. The output coupler is a compact, tunable Michelson interferometer. The output coupling ratio is adjustable between 0 and equal to or greater than 60% for laser line wavelengths between 110 and 500 micrometers. This output coupler provides increased output power and flexibility. Beam profile measurements show that the Michelson output coupler produces a well collimated Gaussian laser beam. Design features are: the use of a 10 micrometers reflection coated quartz vacuum window which acts as a dichroic mirror for the pump radiation; the high mechanical stability obtained by leaf sping flexure mount of the movable Michelson mirror and by restricted alignment devices. THEORETICAL-EXPERIMENTAL STUDY OF THE NON-THERMAL EFFECTS OF THE POLARIZED LASER RADIATION IN LIVING TISSUES M.S. Thesis [ESTUDO TEORICO-EXPERIMENTAL DOS EFEITOS NAO TERMICOS DA RADIACAO LASER POLARIZADA EM TECIDOS VIVOS]
M. S. Ribeiro 1991 116 p In PORTUGESE
(DE93-607212; INIS-BR-2958) Avail: CASI HC A06/MF A02 (US Sales Only)

A fundamental objective was to analyze the non-thermal effects of the laser polarized light in biological tissues. These effects were performed with low power laser output. The theoretical procedure consisted of looking for a simple model which connects the effect of light polarized with microscopically rough tissues using well established physical concepts. Experimentally, artificial wounds were created on the back of animals using liquid nitrogen (this method was chosen because it does not interfere in the biochemistry of the animal tissue). For the wound irradiation a He-Ne attached to an optical system was used. DOE

COMPUTER CONTROL OF PULSED TUNABLE DYE LASERS
S. S. Thattey, A. S. Dongare, B. M. Suri, and L. G. Nair 1992 25 p
(DE93-605896; BARC-1992/E/005) Avail: CASI HC A03/MF A01 (US Sales Only)

Pulsed tunable dye lasers are being used extensively for spectroscopic and photo-chemical experiments, and a system for acquisition and spectral analysis of a volume of data generated will be quite useful. The development of a system for wavelength tuning and control of tunable dye lasers and an acquisition system for spectral data generated in experiments with these lasers are described. With this system, it is possible to control the tuning of three lasers, and acquire data in four channels, simultaneously. It is possible to arrive at the desired dye laser wavelength with a reproducibility of (+-) 0.012 cm(exp -1), which is within the absorption width (atomic interaction) caused by pulsed dye lasers of linewidth 0.08 cm(exp -1). The spectroscopic data generated can be analyzed for spectral identification within absolute accuracy (+-) 0.012 cm(exp -1). DOE

N93-30910# Naval Command, Control and Ocean Surveillance Center, San Diego, CA.
EFFICIENT LASER ACTION FROM TWO CW LASER PUMPED PYRROMETHENE-BF2 COMPLEXES
S. C. Guggenheimer, J. H. Boyer, K. Thangaraj, M. Shah, and M. L. Soong 17 May 1993 12 p
(AD-A264887; NCCOSC/RDT/E-TR-26) Avail: CASI HC A03/MF A01

Two new pyrromethene-BF2 dyes P-556 and P-567 were tested for CW laser operation. P-556 demonstrated a significant advance in the 530-620 nm region over commercial dyes currently available, where the best CW dyes in any range have peak efficiencies on the order of 35% and dyes in this range typically less than 25%. The P-556 has a CW efficiency of 45% at the peak. DTIC

DIFFUSION BONDING
L. E. Brown Mar. 1993 52 p
(Contract DE-AC04-76DP-00789)
(DE93-011480; SAND-92-1941) Avail: CASI HC A04/MF A01

A temperature between 400 and 500 and a pressure between 40 MPa and 160 MPa were indicated by a two-factor, three-level factorial experiment for diffusion bonding of molybdenum sheet substrates. These substrates were sputter ion plated with palladium (0.5 microns) and silver (10 microns) films on the mating surfaces, with the silver used as a bonding interlayer. The palladium acted as an adhesive layer between the silver film and molybdenum substrate. The silver diffusion bonds that resulted were qualitatively characterized at the interfacial regions, and bonds with no visible interface were obtained at 7500X magnification. Correlations were obtained for voids found optically at the silver/silver bonding interface and colored image maps, illustrating bond quality, produced by nondestructive ultrasonic imaging. Above 160 MPa, the bonding process produces samples with a nonuniform load distribution. These samples contained regions with gaps and well-bonded regions at the silver/silver interface, and all had macroscopic deformation of the silver films. DOE

SURFACE MODIFICATION OF TRIBOLOGICAL COMPONENTS IN TRANSPORTATION
G. R. Fenske Nov. 1992 36 p Presented at the Annual Automotive Development Technology Contractors' Coordination Meeting, Dearborn, MI, 2-5 Nov. 1992
(Contract W-31-109-eng-38)
(DE93-008647; ANL/MCT/CP-77166; ANL/VU-77166; CONF-9211101-4)
Avail: CASI HC A03/MF A01

This paper reviews a number of programs funded through the Engineered Tribological Interfaces (ETI) Task area of the Tribology Program that utilize energetic beams of atoms to enhance the mechanical and microstructural properties of near-surface regions to improve the tribological performance of critical components. The processes used in these programs include techniques based on chemical vapor deposition, physical vapor deposition, and ion implantation. A common feature of these techniques is their ability to produce dense and adherent modified surfaces without need for subsequent grinding/polishing treatments. Another feature of these techniques is their ability to introduce a wide range of elements into near-surface regions. DOE

WELDING WIRE PRESSURE SENSOR ASSEMBLY Patent Application
Timothy B. Morris, inventor (to NASA) (Nichols Research Corp., Huntsville, AL.), Peter F. Milly, inventor (to NASA) (Nichols Research Corp., Huntsville, AL.), and J. Kevin White, inventor (to NASA) (Nichols Research Corp., Huntsville, AL.) 27 May 1993 9 p
(NASA-Case-MFS-26216-1; NAS 1.71:MFS-26216-1; US-Patent-Appl-SN-070132) Avail: CASI HC A02/MF A01

The present invention relates to a device which is used to monitor the position of a filler wire relative to a base material being welded as the filler wire is added to a welding pool. The device is applicable to automated welding systems wherein nonconsumable electrode arc welding processes are utilized in conjunction with a filler wire which is added to a weld pool created by the electrode arc. The invention senses pressure deviations from a predetermined pressure between the filler wire and the base material, and provides electrical signals responsive to the deviations for actuating control mechanisms in an automatic welding apparatus so as to minimize the pressure deviation and to prevent disengagement of the contact between the filler wire and the base material. NASA

DUAL ARM GENERALIZED COMPLIANT MOTION WITH SHARED CONTROL Patent Application
Paul G. Backes, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 24 Mar. 1993 60 p
(Contract NAS7-918)
(NASA-Case-NPO-18738-1-CU; NAS 1.71:NPO-18738-1-CU; US-Patent-Appl-SN-034608) Avail: CASI HC A04/MF A01

A multiple arm generalized compliant motion robot control system governs dual multi-joint robot arms handling an object with both of the arms in accordance with input parameters governing plural respective behaviors to be exhibited by the robot in respective behavior spaces simultaneously. A move-squeeze decomposition processor computes actual move and squeeze decomposition forces based upon current robot force sensor outputs. A compliant motion processor transforms plural object position perturbations of the plural behaviors from the respective behavior spaces to a common space and computes a relative transformation to a behavior-commanded object position in accordance with the object position perturbations of the plural behaviors. A kinematics processor updates a transformation to a current commanded object position based upon the relative transformation to the behavior-commanded object position. A multiple arm squeeze control processor computes from appropriate squeeze force input parameters and from actual squeeze forces for each of the arms, a squeeze control position perturbation for each of the arms, to provide squeeze control. An inverse kinematics processor computes from the commanded object position transformation and from the squeeze control position perturbation, new robot joint angles, and controls respective joints of the robot arms in accordance with the new robot joint angles. INSERVICE DIAGNOSTIC METHODS FOR SOLENOID-OPERATED VALVES
R. C. Kryter 1993 8 p Presented at the Meeting on Nuclear Plant Instrumentation, Control and Man-Machine Interface Technologies, Oak Ridge, TN, 18-21 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-007823; CONF-930401-1) Avail: CASI HC A02/MF A01

Solenoid-operated valves (SOV's) were studied at Oak Ridge National Laboratory as part of the USNRC Nuclear Plant Aging Research (NPAR) Program. The primary objective of the study was to identify, evaluate, and recommend methods for inspection, surveillance, monitoring, and maintenance of SOV's that can help ensure their operational readiness-that is, their ability to perform required safety functions under all anticipated operating conditions, since failure of one of these small and relatively inexpensive devices could have serious consequences under certain circumstances. An earlier (Phase 1) NPAR program study described SOV failure modes and causes and had identified measurable parameters thought to be linked to the progression of everpresent degradation mechanisms that may ultimately result in functional failure of the valve. Using this earlier work as a guide, the present (Phase 11) study focused on devising and then demonstrating the effectiveness of techniques and equipment with which to measure performance parameters that show promise for detecting the presence and trending the progress of such degradations before they reach a critical stage. Intrusive techniques requiring the addition of magnetic or acoustic sensors or the application of special test signals were investigated briefly, but major emphasis was placed on the examination of condition-indicating techniques that can be applied with minimal cost and impact on plant operation. Experimental results are presented that demonstrate the technical feasibility and practicality of the monitoring techniques assessed in the study, and recommendations for further work are provided. MULTIVARIABLE CONTROL OF THE SPACE SHUTTLE REMOTE MANIPULATOR SYSTEM USING LINEARIZATION BY STATE FEEDBACK M.S. Thesis
Chang-Ching Lo Gettman May 1993 129 p
(Contract NAS9-18426)
(NASA-CR-188248; NAS 1.26:188248; CSDL-T-1176) Copyright Avail: CASI HC A07/MF A02

This thesis develops and demonstrates an approach to nonlinear control system design using linearization by state feedback. The design provides improved transient response behavior allowing faster maneuvering of payloads by the SRMS. Modeling uncertainty is accounted for by using a second feedback loop designed around the feedback linearized dynamics. A classical feedback loop is developed to provide the easy implementation required for the relatively small on board computers. Feedback linearization also allows the use of higher bandwidth model based compensation in the outer loop, since it helps maintain stability in the presence of the nonlinearities typically neglected in model based designs. AN AUTONOMOUS VISION-BASED MOBILE ROBOT Ph.D. Thesis
Eric Thomas Baumgartner 1993 146 p
Avail: Univ. Microfilms Order No. DA9308220

This dissertation describes estimation and control methods for use in the development of an autonomous mobile robot for structured environments. The navigation of the mobile robot is based on precise estimates of the position and orientation of the robot within its environment. The extended Kalman filter algorithm is used to combine information from the robot's drive wheels with periodic observations of small, wall-mounted, visual cues to produce the precise position and orientation estimates. The visual cues are reliably detected by at least one video camera mounted on the mobile robot. Typical position estimates are accurate to within one inch. A path tracking algorithm is also developed to follow desired reference paths which are taught by a human operator. Because of the time-independence of the tracking algorithm, the speed that the vehicle travels along the reference path is specified independent from the tracking algorithm. The estimation and control methods have been applied successfully to two experimental vehicle systems. Finally, an analysis of the linearized closed-loop control system is performed to study the behavior and the stability of the system as a function of various control parameters. Dissert. Abstr.

SINGLE ACTING TRANSLATION/ROTATIONAL BRAKE Patent Application
Johnny W. Allred, inventor (to NASA) and Vincent J. Fleck, inventor (to NASA) 12 May 1993 15 p
(NASA-Case-LAR-14738-1; NAS 1.71:LAR-14738-1; US-Patent-Appl-SN-064324) Avail: CASI HC A03/MF A01

A brake system is provided that applies braking forces on surfaces in both the translational and rotational directions using a single acting self-contained actuator that travels with the translational mechanism. The brake engages a mechanical lock and creates a frictional force on the translational structure preventing translation while simultaneously creating a frictional torque that prevents rotation of the vertical support. The system may include serrations on the braking surfaces to provide increased breaking forces. NASA

THE DESIGN AND MODELLING OF A COMB-DRIVE-BASED MICROENGINE FOR MECHANISM DRIVE APPLICATIONS
E. J. Garcia and J. J. Sniegowski 1992 5 p Presented at the 7th International Conference on Solid-state Sensors and Actuators, Yokohama, Japan , 7-10 Jun. 1993
(Contract DE-AC04-76DP-00789)
(DE93-009826; SAND-92-2497C; CONF-9306118-1) Avail: CASI HC A01/MF A01

The design and modelling of a comb-drive-based microengine is presented. The motivation for developing such a device came from our own need to drive specific micromechanisms. Difficulty in connecting an external load to an existing micromotor and insufficient torque led us to a design which uses the comb drive concept of Tang, Nguyen, and Howe, to convert linear oscillatory motion into rotational motion. The microengine provides output in the form of a continuously rotating output gear that is capable of delivering torque to a micromechanism. The microengine can be operated at varying speeds and its motion can be reversed. Modelling of the system indicates that dynamic effects are important and that the device behaves in ways similar to that of 'high speed' machinery. Processing considerations address the elimination of natural interferences that arise when conformally deposited polysilicon films form the links, joints, and gears. The resultant device is completely batch fabricated without the need for manual assembly steps. DOE

SENSOR SYSTEMS FOR MONITORING MAGLEV GUIDEWAY STRUCTURES Final Report

J. W. Berthold, J. R. Bower, J. D. Buttram, L. R. Okes, and M. O. Robertson Jul. 1992 85 p
(Contract DTFR53-91-C-00064)
(PB93-154821; DOT/FRA/NMI-92/12) Avail: CASI HC A05/MF A01

The report is an assessment of the technologies available for continuous monitoring of the physical condition and structural integrity of maglev guideways. The detection of obstructions on the guideway is not included. No particular guideway design is assumed, other than that the largest part of the system will consist of repetitive reinforced concrete structures, probably elevated, that are aligned with close tolerances. It is assumed that the guideway is to be monitored for the correct alignment of the sections, any unusual vibrations or motions, detection of catastrophic failure, and possibly accumulation of ice and snow. The technologies covered are acoustic emission monitoring (a passive acoustic method of listening for crack growth or other unusual structure borne sound), infrared and visible light monitoring (ranging from cameras to displacement sensors), ultrasonics (for vibration, displacement, snow and ice), microwave monitors (for vibration and displacement sensors), and fiber optics (for networks of strain gauges). It is the conclusion of the report that the technologies described are sufficiently mature to meet the requirements. Any particular application will certainly need development, and some may need extensive development, but the basic capabilities are there. NTIS

A MANIPULATOR KINEMATIC DESIGN FOR HIGH-VACUUM OPERATION

S. M. Killough 1993 8 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-010264; CONF-930403-36) Avail: CASI HC A02/MF A01

To meet the special requirements for remote maintenance in vacuum environments, a unique manipulator was designed that could be adapted easily to vacuum use. Rather than being concerned with the components that traditionally have made vacuum use difficult, such as flexible wiring, we have developed a new kinematic design that will eliminate the use of these troublesome components. This new manipulator uses a parallel-link configuration to eliminate the need for mounting the motors on moving links, thus also removing the need for flexible cables. The configuration also provides several other unique and beneficial characteristics for nonvacuum USC. DOE

A PORTABLE MODULAR ARCHITECTURE FOR ROBOTIC MANIPULATOR CONTROL

P. L. Butler 1993 7 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-010819; CONF-930403-35) Avail: CASI HC A02/MF A01

A control architecture has been developed to provide a framework for robotic manipulator control. This architecture, called the Modular Integrated Control Architecture (MICA), has been successfully applied to two different manipulator systems. MICA is a portable system in two respects. First, it can be used for the control of different types of manipulator systems. Second, the MICA code is portable across several operating environments. This portability allows the sharing of common control code among various systems. A major portion of MICA is the precise control of multiple processors that have to be coordinated to control a manipulator system. By having MICA control the processor synchronization, the system developer can concentrate on the specific aspects of a new manipulator system. MICA also provides standard functions for trajectory generation that can be used for most manipulators. Custom trajectory generators can be easily added to suit the needs of a particular robotic control system. Another facility that MICA provides is a simulation of the manipulator, allowing the control code to be simulated before trying it on a manipulator system. Using this technique, one can develop code for a manipulator system without risking damage to the arm during development. DOE

COMBINED CENTRIFUGAL FORCE/GRAVITY GAS/LIQUID SEPARATOR SYSTEM Patent

Luis E. Lema, inventor (to Navy) 13 Apr. 1993 6 p Filed 3 Apr. 1992
(AD-D015726; US-Patent-5,202,026; US-Patent-Appl-SN-862689; US-Patent-Class-210-512.1) Avail: US Patent and Trademark Office

A gas/liquid separator system has an outer enclosing tank filled with a demisting packing material. The tank has a gas outlet port and a liquid outlet port located at its top and bottom, respectively. At least one cylindrical, centrifugal force gas/liquid separator is vertically aligned and centrally located within the tank and is surrounded by the packing material. The cylindrical separator receives a gas/liquid mixture, separates the mixture into respective substantially gas and substantially liquid components, and allows the substantially gas components to exit its gas escape port. It also allows the substantially liquid components to exit its liquid escape port. The packing material in the tank further separates the substantially gas and liquid components as they rise and fall, respectively, through the packing material. An inflow line introduces the mixture into the cylindrical separator. The inflow line is upwardly inclined in a direction of flow of the mixture at a point where the inflow line communicates with the cylindrical separator. DTIC

AN ARCHITECTURE FOR ROBOTIC SYSTEM INTEGRATION

P. L. Butler, D. B. Reister, C. S. Gourley (Tennessee Univ., Knoxville.), and S. M. Thayer (Tennessee Univ., Knoxville.) 1993 8 p Presented at the 5th Topical Meeting on Robotics and Remote Systems, Knoxville, TN, 26-29 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-010829; CONF-930403-34) Avail: CASI HC A02/MF A01

An architecture was developed to provide an object-oriented framework for the integration of multiple robotic subsystems into a single integrated system. By using an object-oriented approach, all subsystems can interface with each other, and still be able to be customized for specific subsystem interface needs. The object-oriented framework allows the communications between subsystems to be hidden from the interface specification itself. Thus, system designers can concentrate on what the subsystems are to do, not how to communicate. This system was developed for the Environmental Restoration and Waste Management Decontamination and Decommissioning Project at Oak Ridge National Laboratory. In this system, multiple subsystems are defined to separate the functional units of the integrated system. For example, a Human-Machine Interface (HMI) subsystem handles the high-level machine coordination and subsystem status display. The HMI also provides status-logging facilities and safety facilities for use by the remaining subsystems. Other subsystems have been developed to provide specific functionality, and many of these can be reused by other projects. DOE

RESEARCH ON RECONFIGURABLE AND RELIABLE MANIPULATORS

P. K. Khosla and T. Kanade 1993 5 p
(Contract DE-FG02-89ER-14042)
(DE93-010244; DOE/ER-14042/4) Avail: CASI HC A01/MF A01

We have proposed the concept of reconfigurable manipulators as a solution to tasks that require varied configurations of manipulators. Using modules of varying sizes and performance specifications, it is possible to build manipulators to suit the task at hand. Our research is not only addressing the issue of creating such manipulators but also the interesting theoretical challenges posed in mapping tasks to manipulators. We have developed strategies that allow us to determine the kinematic and dynamic configuration of a non-redundant manipulator from task specifications such as reachability, obstacle avoidance, manipulability, joint, limits, and joint velocities and accelerations. We are presently extending this design methodology for design of redundant and fault tolerant manipulator systems. Further, we are also addressing issues in automatic generation of software for kinematics, dynamics, and controllers for the configured manipulators. During the next year, we will be demonstrating automatic generation of software on the prototype system that we are building. We expect to have 4 joint and link modules available for this demonstration. The joint and link modules will also incorporate concepts for making power and data connections when the mechanical connection is made. Further, they will also include electronics, housed within the module, for communication and real-time control. DOE

MODELING THE EFFECTS OF DROP DRAG AND BREAKUP ON FUEL SPRAYS

Alex B. Liu, Daniel Mather, and Rolf D. Reitz Mar. 1993 17 p
(Contract DAAL03-86-K-0174)
(AD-A263650; TP-930072; ARO-24623.126-EG-UIR) Avail: CASI HC A03/MF A01

Spray models were evaluated using experimentally measured trajectories and drop sizes of single drops injected into a high relative velocity gas flow. The computations were made using a modified version of the KIVA-2 code. It was found that the drop drag coefficient and the drop breakup time model constant had to be adjusted in order to match the measurements. Based on these findings, a new drop drag submodel is proposed in which the drop drag coefficient changes dynamically with the flow conditions. The model accounts for the effects of drop distortion and oscillation due to the relative motion between the drop and the gas. The value of the drag coefficient varies between the two limits of that of a rigid sphere (no distortion) and that of a disk (maximum distortion). The modified model was also applied to diesel sprays. The results show that the spray tip penetration is relatively insensitive to the value used for the drop drag coefficient. However, the distribution of drop sizes within sprays is influenced by drop drag. This is due to the fact that changes in drop drag produce changes in the drop-gas relative velocity. This, in turn, causes changes in the spray drop size through the drop breakup and coalescence processes. The changes occur in such a way that the net effect on the spray penetration is small over the tested ranges of conditions. These results emphasize that measurements of spray penetration are not sufficient to test and produce improved spray models. Instead, local measurements of drop size and velocity are needed to develop accurate spray models. DTIC

A captured nut member is located within a tool interface assembly and being actuated by a spline screw member driven by a robot end effector. The nut member lowers and rises depending upon the directional rotation of the coupling assembly. The captured nut member further includes two winged segments which project outwardly in diametrically opposite directions so as to engage and disengage a clamping surface in the form of a chamfered notch respectively provided on the upper surface of a pair of parallel forwardly extending arm members of a bifurcated tool stowage holster which is adapted to hold and store a robotic tool including its end effector interface when not in use. A forward and backward motion of the robot end effector operates to insert and remove the tool from the holster.

QUICK CONNECT FASTENER Patent Application

Bruce Weddendorf, inventor (to NASA) 1 Jun. 1993 16 p
(NASA-Case-MFS-28833-1; NAS 1.71:MFS-28833-1;
US-Patent-Appl-SN-069481) Avail: CASI HC A03/MF A01

This invention relates to a quick connect fastener for attachment to an axially elongated externally threaded member by axially thrusting the fastener onto the member, the fastener having an outer casing including a passageway having a frustoconical surface. A segmented core having four internally threaded shells is positioned within the casing, the shells having a frustoconical outer surface and a cylindrical annulus including a standard thread profile. The shells include a groove at each end for receiving a C-shaped clip which urge the shells radially outwardly and toward the larger end of the passageway. A coil spring positioned within the nut casing at the larger end acts to urge the shells toward a surface acting as a stop at the smaller end which limits movement of the shells and counteracts a substantial amount of the tension of the externally threaded member. Raised keys on the surfaces of the shells are received within grooves in the casing so that the shells rotate upon rotation of the shell. NASA

OPTIMAL GEOMETRIC DESIGN OF ROBOTS FOR ENVIRONMENTS WITH OBSTACLES Ph.D. Thesis

Krasimir Dobromirov Kolarov 1993 214 p
Avail: Univ. Microfilms Order No. DA9309623

The problem discussed is: given an environment with obstacles, what is the optimal design of a robot that can reach everywhere in this environment without collision with the obstacles. The main questions of concern are: what is the most appropriate type for the links of the robot; what is the minimum number of links that are needed to cover every point in the free space; and what is the best placement for the robot in the environment. The primary joint type employed is a one degree of freedom prismatic joint which folds into itself like a telescope to some minimal length. Our robot is formed by connecting each telescopically jointed link to a revolute joint at its other end. The revolute axes are perpendicular to the prismatic axes. The links thus formed are called 'telescoping links.' All links of the robots that are considered have telescoping structure. In the first part, some algorithms for finding the set of points in the environment (the link center) that can reach all other points with minimum number of telescoping links is discussed. The description and implementation of an algorithm that finds all visibility polygons from a given point when the obstacles are modeled as convex polygons are discussed. This algorithm is used in the implementation of algorithms for finding the link center and an approximate link center. The modifications and the additions that these algorithms require to cover curvilinear, non-convex and three-dimensional obstacles are discussed. In the second part, several theorems that establish upper and lower bounds on the number of links needed to cover the free space in both planar and spatial cases are derived. Some algorithms for minimizing the upper bounds to, hopefully, the optimal number of links for the environment are described. Finally, several generalizations to the basic problem for the cases when we design both the robot and the environment simultaneously, when we deal with moving robots and obstacles, multiple robots or robots with variable structure are considered. Dissert. Abstr.

INPUT RELEGATION CONTROL FOR GROSS MOTION OF A KINEMATICALLY REDUNDANT MANIPULATOR
M. A. Unseren 1993 26 p Presented at the 1993 Institute of Electrical and Electronics Engineers/Robotics Society of Japan (IEEE/RSJ) International Conference on Intelligent Robots and Systems (IROS), Yokohama, Japan, 26-30 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE93-005301; CONF-930736-1) Avail: CASI HC A03/MF A01

This paper proposes a method for resolving the kinematic redundancy of a serial link manipulator moving in a three-dimensional workspace. The underspecified problem of solving for the joint velocities based on the classical kinematic velocity model is transformed into a well-specified problem. This is accomplished by augmenting the original model with additional equations which relate a new vector variable quantifying the redundant degrees of freedom (DOF) to the joint velocities. The resulting augmented system yields a well specified solution for the joint velocities. Methods for selecting the redundant DOF quantifying variable and the transformation matrix relating it to the joint velocities are presented so as to obtain a minimum Euclidean norm solution for the joint velocities. The results obtained from experimentally implementing the proposed scheme on the CESARM research manipulator are presented. DOE

CONTAINMENT OF EXPLOSIONS IN SPHERICAL VESSELS
T. A. Duffey, J. M. Greene, W. E. Baker (New Mexico Univ., Albuquerque.), and B. B. Lewis (APTEK, Inc., Colorado Springs, CO.) 1992 22 p Presented at the Pressure Vessel and Piping Conference, Denver, CO, 25-29 Jul. 1993
(Contract W-7405-eng-36)
(DE93-005445; LA-UR-92-4061; CONF-930702-2) Avail: CASI HC A03/MF A01

A correlation of the experimentally recorded dynamic response of a spherical containment vessel with theoretical finite element calculations is presented. Three experiments were performed on the 6-ft-diameter steel vessel using centrally located 12-lb. and 40-lb. high explosive charges. Pressure-time loading on the inner wall of the vessel was recorded for each test using pressure transducers. Resulting dynamic response of the vessel was recorded for each test using strain gages mounted at selected locations on the outer surface of the vessel. Response of the vessel was primarily elastic. A finite element model of the vessel was run using DYNA3D, a dynamic structural analysis code. Pressure loading for the finite element model was based on results from a one-dimensional reactive hydrodynamics code. Correlations between experiments and analysis were generally good for the tests for frequency and strain magnitude at most locations. Comparisons of experimental and calculated pressure-time histories were less satisfactory. DOE

EXPERIMENTAL AND ANALYTICAL INVESTIGATION OF FINGER-FOLLOWER CAM SYSTEMS Ph.D. Thesis
Wensyang Hsu 1992 164 p
Avail: Univ. Microfilms Order No. DA9304948

A predictive dynamic model to compute the motions of components in cam systems, along with the experimental work to verify the model are described. The major components in finger-follower cam systems include the cam, the follower, the hydraulic lash adjuster, and the valve spring, equipped sometimes with a helical valve spring cup damper. In order to fully describe the dynamics of such a system, a lumped/distributed parameter model for the finger-follower cam system with a moving follower pivot is proposed. The valve spring is modeled as a distributed parameter element, and the adjuster is modeled as a stiff spring with viscous damping. The coulomb friction combined with viscous damping between sliding surfaces are also considered. The model predicts toss between the adjuster and the follower at 2535 rpm, and experiment indicates toss starting at 2520 rpm. It is found by simulation that designing hydraulic lash adjuster to be as rigid as possible is essential to successful high speed operation of finger-follower valve trains because a 50 percent decrease in the compliance of the adjuster could increase the maximum camshaft operating speed 150 rpm. Total elimination of the hydraulic lash adjuster is not always feasible because hydraulic lash adjusters can eliminate the clearance between components and do not need to be mechanically, manually adjusted. In order to provide a more stable and precise description on the dynamic response of the adjuster, a two-mode dynamic model for the adjuster is proposed by considering the oil compressibility in the oil chamber, as well as the oil leakage through the annular gap. Furthermore, the effect due to the oil flow from the central orifice to the oil chamber is also studied analytically and experimentally. The inertia effects of the helical valve spring can be suppressed by a cup damper. Damping between the damper and spring wire is found to depend only weakly on relative sliding velocity. The current formula in computing spring force including the effects of coulomb friction, spring coil dilation, bending moments on both the spring wire and the damper, is verified by comparison between different models and experimental data. Dissert. Abstr.

DRIVE-REINFORCEMENT LEARNING SYSTEM APPLICATIONS Final Report, 1 Jan. 1989 - 1 Jul. 1992
Daniel W. Johnson 31 Jul. 1992 76 p
(Contract F33615-89-C-1023)
(AD-A264514; WL-TR-92-1122) Avail: CASI HC A05/MF A01

The application of Drive-Reinforcement (D-R) to the unsupervised learning of manipulator control functions was investigated. In particular, the ability of a D-R neuronal system to learn servo-level and trajectory-level controls for a robotic mechanism was assessed. Results indicate that D-R based systems can be successful at learning these functions in real-time with actual hardware. Moreover, since the control architectures are generic, the evidence suggests that D-R would be effective in control system applications outside the robotics arena. DTIC

CRYOGENIC MAGNETIC BEARING Final Report, 1 Nov. 1985 - 1 May 1991
James Andrus, John Kendig, and John Kroeger Dec. 1992 98 p
(Contract F33615-86-C-5015)
(AD-A264716; S71-1180-1.0-1; WL-TR-91-4150) Avail: CASI HC A05/MF A02

Magnetic suspension provides an alternative to rolling-element bearings for some precision gimbal applications. The Cryogenic Magnetic Bearing program includes studies of magnetic suspension for a gimbal bearing requiring long life (greater than 7 years); low runout (less than 5 microrads bore-sight error due to runout); and low, uniform drag torque. Additionally, the bearing is to operate in an oscillating mode, from room-ambient (300 K) to liquid nitrogen (77 K) temperatures at ambient pressure and in a hard vacuum (10 (exp-6) torr). Two magnetic suspension alternatives were studied: an all-active approach using electromagnets to control all five bearing degrees-of-freedom and a Passive-Radial Active-Axial (PRAA) approach using passive magnetics to stabilize four of the five bearing degrees-of-freedom and an electromagnet to control the fifth. The all-active approach provides a lower weight, better-accuracy bearing system than the PRAA system, but requires more quiescent operating power and is electrically more complex. The PRAA was selected for hardware study to produce a simple, low-power magnetic system. DTIC

FUNDAMENTAL STUDIES OF FRICTION, LUBRICATION, AND WEAR BY ATOMIC FORCE MICROSCOPY
Gary M. McCleeland 14 Apr. 1993 40 p

(Contract F49620-89-C-0068)
(AD-A264647; AFOSR-93-0333TR) Avail: CASI HC A03/MF A01

To probe friction, lubrication, and wear on an atomic scale, a capacitance-based ultrahigh vacuum force microscope was developed. It measures both parallel and perpendicular forces between a tip and a surface. Friction between a diamond tip and chemical-vapor-deposited (CVD) diamond films at loads below one micronewton showed a sublinear dependence of friction on load, with the effective friction coefficient varying between 0.2 and 0.8 depending on load and location. Stick-slip behavior resulting from both surface heterogeneity and static/dynamic friction was observed. A CVD process was developed for growing single crystal diamond tips with radii as small as 30 nm. The normal force between these tips and diamond (100) and (111) surfaces agrees with calculated dispersion forces. The frictional force variation on the (100) surface are tentatively associated with a reconstructed geometry convoluted over an asymmetric tip shape, while the (111) surface exhibits features which cannot be simply associated with the surface structure. Friction is approximately 3 nanonewtons independent of loads up to 100 nanonewtons. A field emission technique was developed for continuously observing the motion of individual adsorbed atoms and molecules. The hopping of individual Cs atoms between sites on a tungsten tip was observed with 2 ps and 5 Angstrom resolution. DTIC

MOLD BOLT AND MEANS FOR ACHIEVING CLOSE TOLERANCES BETWEEN BOLTS AND BOLT HOLES Patent Application
David Johnston, inventor (to NASA) and Phillip G. Bryant, inventor (to NASA) (Teledyne Brown Engineering, Huntsville, AL.) 27 Jan. 1993 12 p
(NASA-Case-MFS-28720-1; NAS 1.71:MFS-28720-1; US-Patent-Appl-SN-009909) Avail: CASI HC A03/MF A01

In the space shuttle, a cargo bay storage rack was required which was to be manufactured from a metal-plastic composite and bolted to a cargo structure. Following completion, utilization of the rack was disallowed due to tolerances, that is, the size differences between the outside bolt diameter and the inside hole diameter. In addition to the space shuttle problem there are other close tolerance requirements for bolts. Such environments often benefit from close tolerance bolting. Frequently such fabrication is not cost effective. Consequently there is a need for means of achieving close tolerances between bolts and bolt holes. Such means are provided. After compressing the elements together a strong rigid plastic, ceramic, or ceramic plastic fluid is forced into a channel extending through the bolt. NASA

STRUCTURAL DESIGN, ANALYSIS, AND CODE EVALUATION OF AN ODD-SHAPED PRESSURE VESSEL
M. A. Rezvani and H. H. Ziada Dec. 1992 8 p Presented at the Pressure Vessel and Piping Conference, Denver, CO, 25-29 Jul. 1993
(Contract DE-AC06-87RL-10930)
(DE93-008182; WHC-SA-1684; CONF-930702-8) Avail: CASI HC A02/MF A01

An effort to design, analyze, and evaluate a rectangular pressure vessel is described. Normally pressure vessels are designed in circular or spherical shapes to prevent stress concentrations. In this case, because of operational limitations, the choice of vessels was limited to a rectangular pressure box with a removable cover plate. The American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code is used as a guideline for pressure containments whose width or depth exceeds 15.24 cm (6.0 in.) and where pressures will exceed 103.4 KPa (15.0 lbf/in(sup 2)). This evaluation used Section 8 of this Code, hereafter referred to as the Code. The dimensions and working pressure of the subject vessel fall within the pressure vessel category of the Code. The Code design guidelines and rules do not directly apply to this vessel. Therefore, finite-element methodology was used to analyze the pressure vessel, and the Code then was used in qualifying the vessel to be stamped to the Code. Section 8, Division 1 of the Code was used for evaluation. This action was justified by selecting a material for which fatigue damage would not be a concern. The stress analysis results were then checked against the Code, and the thicknesses adjusted to satisfy Code requirements. Although not directly applicable, the Code design formulas for rectangular vessels were also considered and presented. DOE

GRAPHICAL PROGRAMMING: ON-LINE ROBOT SIMULATION FOR TELEROBOTIC CONTROL
M. J. McDonald and R. D. Palmquist 1993 15 p Presented at the International Robots and Vision Conference, Detroit, MI, 6-8 Apr. 1993
(Contract DE-AC04-76DP-00789)
(DE93-009796; SAND-93-0003C; CONF-930491-2) Avail: CASI HC A03/MF A01

Sandia has developed an advanced operational control system approach, caged Graphical Programming, to design and operate robotic waste cleanup and other hazardous duty robotic systems. The Graphical Programming approach produces robot systems that are faster to develop and use, safor in operation, and cheaper overall than alternative teleoperation or autonomous robot control systems. The Graphical Programming approach uses 3-D visualization and simulation software with intuitive operator interfaces for the programming and control of complex robotic systems. Graphical Programming Supervisor software modules allow an operator to command and simulate complex tasks in a graphic preview mode and, when acceptable, command the actual robots and monitor their motions with the graphic system. Graphical Programming Supervisors maintain registration with the real world and allow the robot to perform tasks that cannot be accurately represented with models alone by using a combination of model and sensor-based control. This paper describes the Graphical Programming approach, several example control systems that use Graphical Programming, and key features necessary for implementing successful Graphical Programming systems. GUIDEWAY STRUCTURAL DESIGN AND POWER/PROPULSION/BRAKING IN RELATION TO GUIDEWAYS, VOLUME 1 Final Report, Aug. 1991 - Jan. 1992
K. M. Falkowski, F. S. Key, and S. B. Kuznetsov Jan. 1993 269 p See also PB93-169910 Sponsored by National Maglev Initiative (FRA), Washington, DC
(Contract DTFR53-91-C-00065)
(PB93-169902; DOT/FRA/NMI-92/25-Vol-1) Avail: CASI HC A12/MF A03

The report summarizes work completed in the investigation of the power, propulsion, and braking systems for five different electrodynamic (EDS) Maglev configurations. System requirements and recommendations, including a cost analysis, are determined for each configuration. The analysis considers variations in vehicle length, acceleration/deceleration criteria, airgap clearance, and maximum propulsion thrust. Five different guideway configurations have been considered, each of which is based on air-core magnets made from low-temperature superconductors (LTSC) or the new high-T(sub c) ceramic superconductors (HTSC's). The material requirements and cost of the guideway electrical components were studied as a function of the energy conversion efficiency, the stator block length, armature current density, stator temperature rise, and other parameters. The propulsion design focused on a dual-parallel, linear synchronous motor (LSM) with thrust modulation achieved by applying a variable frequency and voltage along the guideway. Critical design parameters were estimated using a three-dimensional computer model for the inductances, magnetic fields, and electromagnetic forces. NTIS

VEHICLE DYNAMIC STABILITY AND ROLLOVER Final Report
R. W. Allen, H. T. Szostak, D. H. Klyde, T. J. Rosenthal, and K. J. Owens Jun. 1992 300 p See also PB90-115445 Sponsored by National Highway Traffic Safety Administration, Washington, DC
(Contract DTNH22-88-C-07384)
(PB93-185437; STI-TR-1268-1; DOT-HS-807 956) Avail: CASI HC A13/MF A03

The report considers ground vehicle lateral/directional stability which is of primary concern in traffic safety. Lateral/directional dynamics involve yawing, rolling, and lateral acceleration motions, and stability concerns include spinout and rollover. The report describes accident analysis, vehicle testing, and computer simulation analysis designed to give insight into basic vehicle design variables that contribute to stability problems. The results of vehicle testing and simulation analysis indicate that a vehicle that has both a relatively low ratio of track width to center of gravity height and is equipped with tires which have a relatively high peak coefficient of friction will have a propensity to rollover during steering maneuvers on a flat surface. Vehicle testing and computer simulation analysis also indicate that directional stability is significantly influenced by the relationship between vehicle weight distribution and lateral load transfer distribution that is greater than or equal to the percent weight on the front axle. ORBITAL TRANSFER VEHICLE OXYGEN TURBOPUMP TECHNOLOGY. VOLUME 3: HOT OXYGEN TESTING Final Report, 17 Jul. - 31 Dec. 1989
Robert L. Urke Oct. 1992 94 p
(Contract NAS3-23772)
(NASA-CR-191036; NAS 1.26:191036) Avail: CASI HC A05/MF A01

This report covers the work done in preparation for a liquid oxygen rocket engine turbopump test utilizing high pressure hot oxygen gas for the turbine drive. The turbopump (TPA) is designed to operate with 400 F oxygen turbine drive gas. The goal of this test program was to demonstrate the successful operation of the TPA under simulated engine conditions including the hot oxygen turbine drive. This testing follows a highly successful series of tests pumping liquid oxygen with gaseous nitrogen as the turbine drive gas. That testing included starting of the TPA with no assist to the hydrostatic bearing. The bearing start entailed a rubbing start until the pump generated enough pressure to support the bearing. The articulating, self-centering hydrostatic bearing exhibited no bearing load or stability problems. The TPA was refurbished for the hot gas drive tests and facility work was begun, but unfortunately funding cuts prohibited the actual testing. Author (revised)

The Aging Aircraft NDI Development and Demonstration Center (AANC) at Sandia National Laboratories is charged by the FAA to support technology transfer, technology assessment, and technology validation. A key task facing the center is the establishment of a consistent and systematic methodology to assess the reliability of inspections through field experiments. This task is divided into three major areas: reliability of eddy current lap splice inspections at transport aircraft maintenance facilities; reliability of inspection at commuter aircraft maintenance facilities; and reliability of inspection associated with visual inspection of aircraft structural parts. Volume 2 is the second document in a series of three describing the planning, execution, and results of an eddy current inspection field experiment. This document provides a detailed description of the experimental hardware and protocols. It also describes the methodology to be used in the analysis of the data. Author (revised)

USE OF LOCAL X RAY COMPUTERIZED TOMOGRAPHY FOR HIGH-RESOLUTION, REGION-OF-INTEREST INSPECTION OF LARGE CERAMIC COMPONENTS FOR ENGINES
E. A. Sivers, D. A. Holloway, and W. A. Ellingson 1993 21 p Presented at the 38th ASME International Gas Turbine and Aeroengine Congress and Exhibition, Cincinnati, OH, 24-27 May 1993
(Contract W-31-109-eng-38)
(DE93-005564; ANL/MCT/CP-77501; CONF-930502-2) Avail: CASI HC A03/MF A01

Reliability continues to be an issue in ceramic components for high-temperature, high-wear applications in advanced engine designs. Recently, high-resolution, three-dimensional, X-ray computerized tomography (XRCT) has been shown to be invaluable for inspecting relatively small components. However, the time and system capacity required to collect complete high-resolution data for large ceramic objects is often prohibitive. When only the critical regions of a large component need be inspected with high resolution, region-of-interest XRCT is a viable alternative. With local XRCT methods used on data taken through only the critical area, it is possible to reconstruct flat, 'edge-enhanced' images in which density differences are clearly delineated. We present XRCT results from local scans of critical regions in a large, pressure-slip-cast, Si3N4 turbine rotor and two Si3N4 test phantoms. We also illustrate how the method can be extended to larger assemblies of ceramic components. DOE

ACOUSTO-ULTRASONIC ANALYSIS OF FAILURE IN CERAMIC MATRIX COMPOSITE TENSILE SPECIMENS
Harold E. Kautz and Abhisak Chulya (Cleveland State Univ., OH.) Jun. 1993 10 p Presented at the Second International Conference on Acousto-Ultrasonics, Atlanta, GA, 24-25 Jun. 1993; sponsored by American Society for Nondestructive Testing, Inc.
(RTOP 510-01-50)
(NASA-TM-106219; E-7930; NAS 1.15:106219) Avail: CASI HC A02/MF A01

Three types of acousto-ultrasonic (AU) measurements, stress-wave factor (SWF), lowest antisymmetric plate mode group velocity (VS), and lowest symmetric plate mode group velocity (VL), were performed on specimens before and after tensile failure. Three different Nicalon fiber architectures with ceramic matrices were tested. These composites were categorized as 1D (unidirectional fiber orientation) SiC/CAS glass ceramic, and 2D and 3D woven SiC/SiC ceramic matrix materials. SWF was found to be degraded after tensile failure in all three material categories. VS was found to be degraded only in the 1D SiC/CAS. VL was difficult to determine on the irregular specimen surfaces but appeared unchanged on all failed specimens. 3D woven specimens with heat-treatment at high temperature exhibited degradation only in SWF. HIDDEN MARKOV MODELS FOR FAULT DETECTION IN DYNAMIC SYSTEMS Patent Applications
Padhraic J. Smyth, inventor (to NASA) (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) 7 Apr. 1993 60 p
(Contract NAS7-918)
(NASA-Case-NPO-18982-1-CU; NAS 1.71:NPO-18982-1-CU; US-Patent-Appl-SN-047135) Avail: CASI HC A04/MF A01

The invention is a system failure monitoring method and apparatus which learns the symptom-fault mapping directly from training data. The invention first estimates the state of the system at discrete intervals in time. A feature vector x of dimension k is estimated from sets of successive windows of sensor data. A pattern recognition component then models the instantaneous estimate of the posterior class probability given the features, p(w(sub i) perpendicular to x), 1 less than or equal to i is less than or equal to m. Finally, a hidden Markov model is used to take advantage of temporal context and estimate class probabilities conditioned on recent past history. In this hierarchical pattern of information flow, the time series data is transformed and mapped into a categorical representation (the fault classes) and integrated over time to enable robust decision-making. US-Patent-Appl-SN-060617) Avail: CASI HC A03/MF A01

A light source directs ultraviolet light onto a test surface and a detector detects a current of photoelectrons generated by the light. The detector includes a collector which is positively biased with respect to the test surface. Quality is indicated based on the photoelectron current. The collector is then negatively biased to replace charges removed by the measurement of a nonconducting substrate to permit subsequent measurements. Also, the intensity of the ultraviolet light at a particular wavelength is monitored and the voltage of the light source varied to maintain the light a constant desired intensity. The light source is also cooled via a gas circulation system. If the test surface is an insulator, the surface is bombarded with ultraviolet light in the presence of an electron field to remove the majority of negative charges from the surface. The test surface is then exposed to an ion field until it possesses no net charge. The technique described above is then performed to assess quality. NASA

THE QUALITY ASSURANCE LIAISON: COMBINED TECHNICAL AND QUALITY ASSURANCE SUPPORT

S. L. Bolivar and J. L. Day (Los Alamos Technical Associates, Inc., NM.) 1993 8 p Presented at the 17th Annual Rocky Mountain Quality Conference, Denver, CO, 6-8 Jun. 1993
(Contract W-7405-eng-36)
(DE93-008725; LA-UR-93-690; CONF-9306114-1) Avail: CASI HC A02/MF A01

The role of the quality assurance liaison, the responsibilities of this position, and the evolutionary changes in duties over the last six years are described. The role of the quality assurance liaison has had a very positive impact on the Los Alamos Yucca Mountain Site Characterization (YW) quality assurance program. Having both technical and quality assurance expertise, the quality assurance liaisons are able to facilitate communications with scientists on quality assurance issues and requirements, thereby generating greater productivity in scientific investigations. The quality assurance liaisons help ensure that the scientific community knows and implements existing requirements, is aware of new or changing regulations, and is able to conduct scientific work within Project requirements. The influence of the role of the quality assurance liaison can be measured by an overall improvement in attitude of the staff regarding quality assurance requirements and improved job performance, as well as a decrease in deficiencies identified during both internal and external audits and surveillances. This has resulted in a more effective implementation of quality assurance requirements. DOE

THE CURVATURE OF PLANE ELASTIC CURVES Tech Report, Jan. 1993 - Mar. 1993

Guido Brunnett 17 Mar. 1993 19 p
(AD-A263198; NPS-MA-93-013) Avail: CASI HC A03/MF A01

In this paper, plane elastic curves are revisited from a viewpoint that emphasizes curvature properties of these curves. The family of elastic curves is considered in dependence of a tension parameter Sigma and the squared global curvature maximum K2/m. It is shown that for any elastic curve K2/m is bigger than the tension parameter Sigma. A curvature analysis of the fundamental forms of the elastic curves is presented. A formula is established that gives the maximum turning angle of an elastica as a function depending on K2/m and Sigma. Finally, it is shown that an elastic curve can be represented as a linear combination of its curvature, arc length, and energy function and that any curve with this property is an elastic. DTIC

FINITE ELEMENT ANALYSIS OF TIME-INDEPENDENT SUPERCONDUCTIVITY Ph.D. Thesis Final Report

James J. Schuler May 1993 257 p
(Grant NAG3-934; RTOP 509-10-11)
(NASA-CR-191140; E-7852; NAS 1.26:191140) Avail: CASI HC A12/MF A03

The development of electromagnetic (EM) finite elements based upon a generalized four-potential variational principle is presented. The use of the four-potential variational principle allows for downstream coupling of EM fields with the thermal, mechanical, and quantum effects exhibited by superconducting materials. The use of variational methods to model an EM system allows for a greater range of applications than just the superconducting problem. The four-potential variational principle can be used to solve a broader range of EM problems than any of the currently available formulations. It also reduces the number of independent variables from six to four while easily dealing with conductor/insulator interfaces. This methodology was applied to a range of EM field problems. Results from all these problems predict EM quantities exceptionally well and are consistent with the expected physical behavior. Author

CRACK LENGTH DETERMINATION BY ULTRASONIC METHODS

D. K. Rehbein, R. B. Thompson, and O. Buck 1992 7 p Presented at the Review of Progress in Quantitative Non Destructive Evaluation (NDE), La Jolla, CA, 19-24 Jul. 1992
(Contract W-7405-eng-82)
(DE93-008075; IS-M-739; CONF-920799-6) Avail: CASI HC A02/MF A01

Under the restriction of being able to operate in through transmission with focussed transducers, it has been shown that the location of the tip of a fatigue crack can be determined to within 0.5 mm in those cases where curvature of the crack front is significant with correspondingly better accuracy as the curvature decreases. Location of the crack tip is accomplished through use of the distributed spring model and also yields information on the residual stresses due to closure. The technique used is able to determine the crack length to within (plus minus) 0.5 mm in the unloaded condition in contrast to most of the work done previously, removing the necessity for application of a load sufficient to fully open the crack. (DE93-009458; UCRL-ID-111489) Avail: CASI HC A03/MF A01

In this report, a simple fluid-structure interaction problem is proposed as a benchmark test for fluid-structure codes. The report details the solution to the problem of a plane wave scattering off an elastic cylinder with internal structure in an acoustic medium. The particular system analyzed is an infinitely long cylinder with an internal hinged plate. and as such, the problem is two dimensional in nature. The analysis sets up the basics of acoustic scattering from elastic structures and then proceeds to develop the particular solution for the chosen structure. The complete solution to the steady state problem is developed in terms of harmonic series in the polar angle. The final expressions are in terms of infinite series over the cylindrical shell harmonics and permit comparisons and validation of results from numerical techniques such as finite difference and finite element methods. It is noted that the geometry, although simple, embodies some of the main features of more complicated problems and thus makes the given problem suitable for use in benchmarking and verification. PROBABILISTIC SIMULATION OF MULTI-SCALE COMPOSITE BEHAVIOR

D. G. Liaw (Sverdrup Technology, Inc., Brook Park, OH.), M. C. Shiao (Sverdrup Technology, Inc., Brook Park, OH.), S. N. Singhal (Sverdrup Technology, Inc., Brook Park, OH.), and Christos C. Chamis Jun. 1993 14 p Presented at the 6th Japan-US Conference on Composite Materials, Orlando, FL, 22-25 Jun. 1992
(RTOP 510-02-12)
(NASA-TM-106196; E-7904; NAS 1.15:106196) Avail: CASI HC A03/MF A01

A methodology is developed to computationally assess the probabilistic composite material properties at all composite scale levels due to the uncertainties in the constituent (fiber and matrix) properties and in the fabrication process variables. The methodology is computationally efficient for simulating the probability distributions of material properties. The sensitivity of the probabilistic composite material property to each random variable is determined. This information can be used to reduce undesirable uncertainties in material properties at the macro scale of the composite by reducing the uncertainties in the most influential random variables at the micro scale. This methodology was implemented into the computer code PICAN (Probabilistic Integrated Composite ANalyzer). The accuracy and efficiency of this methodology are demonstrated by simulating the uncertainties in the material properties of a typical laminate and comparing the results with the Monte Carlo simulation method. The experimental data of composite material properties at all scales fall within the scatters predicted by PICAN. Author

DESIGN AND EVALUATION OF A UNIAXIAL PULL TEST FOR LITHIUM HYDRIDE/DEUTERIDE

D. A. Waldrop, M. J. Marsicek, and K. C. Liu (Oak Ridge National Lab., TN.) Dec. 1992 20 p
(Contract DE-AC05-84OS-21400)
(DE93-010760; Y-2447) Avail: CASI HC A03/MF A01

A uniaxial pull test was developed for determining tensile strength of lithium hydride (LiH). Objectives were to establish the capability of acquiring highly credible uniaxial strength data using a conventional pull specimen and to assess compatibility of existing data bases from disk flexure, four-point bend, and ring tensile tests. A specimen was designed using elliptic contours between gage section and button-head ends to minimize stress concentrations. A finite-element stress analysis was performed. Bending strains resulting from load train misalignment were also minimized by close tolerancing of the gripping fixture and the use of hydraulic-universal joints. Twenty specimens were fabricated and tested for a preliminary date base. Bending studies were conducted on two specimens. Within the load range of interest, bending stresses accounted for about 1% of the nominal stress. The test provided reliable, true-uniaxial strength data. Comparison with existing data bases suggests that high-stress gradients within a specimen may alter strength distribution. DOE

THE GROWTH OF SMALL CORROSION FATIGUE CRACKS IN ALLOY 2024

Robert S. Piascik and Scott A. Willard (Lockheed Engineering and Sciences Co., Hampton, VA.) Apr. 1993 31 p
(RTOP 538-02-10-01)
(NASA-TM-107755; NAS 1.15:107755) Avail: CASI HC A03/MF A01

The corrosion fatigue crack growth characteristics of small surface and corner cracks in aluminum alloy 2024 is established. The damaging effect of salt water on the early stages of small crack growth is characterized by crack initiation at constituent particle pits, intergranular microcracking for a less than 100 micrometers, and transgranular small crack growth for a micrometer. In aqueous 1 percent NaCl and at a constant anodic potential of -700 mV(sub SCE), small cracks exhibit a factor of three increase in fatigue crack growth rates compared to laboratory air. Small cracks exhibit accelerated corrosion fatigue crack growth rates at low levels of delta-K (less than 1 MPa square root of m) below long crack delta-K (sub th). When exposed to Paris regime levels of crack tip stress intensity, small corrosion fatigue cracks exhibit growth rates similar to that observed for long cracks. Results suggest that crack closure effects influence the corrosion fatigue crack growth rates of small cracks (a less than or equal to 100 micrometers). This is evidenced by similar small and long crack growth behavior at various levels of R. Contrary to the corrosion fatigue characteristics of small cracks in high strength steels, no pronounced chemical crack length effect is observed for Al by 2024 exposed to salt water. Author

FACTORS INFLUENCING THE INTERLAMINAR FRACTURE TOUGHNESS AND ITS EVALUATION IN COMPOSITES

Robin Olsson Dec. 1992 54 p Sponsored by Swedish Defence Materials Administration
(FFA-TN-1991-34) Avail: CASI HC A04/MF A01

This review discusses in qualitative terms different physical factors that have to be considered when characterizing delamination toughness of polymetric continuous fiber composites. The mere determination of delamination toughness is not trivial and is discussed first. The resistance to delamination of composites is highly dependent on the mode of fracture and the fiber angles of the plies adjacent to the crack. Loading rate and hygrothermal effects can have a large influence on the material toughness and are discussed. The toughness of the composite is highly dependent on the properties of the constituents and their interaction in the composite. This question is discussed and the physical causes for poor transfer of neat resin toughness to the composite are clarified. Author

WIND LOADS ON CANOPY ROOFS

J. D. Ginger and C. W. Letchford Jun. 1991 80 p Sponsored by Australian Research Council
(RR-CE132; ISBN-0-86776-462-7) Avail: CASI HC A05/MF A01

Wind pressure distributions on 30 m x 30 m canopy roofs over a range of roof pitch angles were determined in the wind tunnel, in a simulated, terrain category 3 (AS-1170) atmospheric boundary layer flow at a length scale of 1/100. Contour plots of local point pressures indicate that the largest pressures were experienced close to the leading edges and the ridge line at a wind orientation of 30 degrees. These contour plots also provide information on the flow mechanisms over the roof. The largest area averaged pressure coefficients were obtained on the leading sections of the roof at a wind orientation of between 20 and 30 degrees. Area averaged pressures on rectangular strips in regions close to the leading edges and ridge line experience pressures substantially larger than those on the rest of the roof. Author

NONLINEAR ANALYSES OF COMPOSITE AEROSPACE STRUCTURES IN SONIC FATIGUE Progress Report, 16 Dec. 1992 - 15 Jun. 1993

Chuh Mei Jun. 1993 21 p
(Grant NAG1-1358)
(NASA-CR-193124; NAS 1.26:193124) Avail: CASI HC A03/MF A01

This report summarizes the semiannual research progress, accomplishments, and future plans performed under the NASA Langley Research Center Grant No. NAG-1-1358. The primary research effort of this project is the development of analytical methods for the prediction of nonlinear random response of composite aerospace structures subjected to combined acoustic and thermal loads. The progress, accomplishments, and future plates on four sonic fatigue research topics are described. The sonic fatigue design and passive control of random response of shape memory alloy hybrid composites presented in section 4, which is suited especially for HSCT, is a new initiative. BOUNDS ON INTERNAL STATE VARIABLES IN VISCOPLASTICITY

Alan D. Freed Jun. 1993 6 p Prepared for Plasticity 1993, Baltimore, MD, 19-23 Jul. 1993; sponsored by Univ. of Maryland

(RTOP 505-63-5A)
(NASA-TM-106215; E-7924; NAS 1.15:106215) Avail: CASI HC A02/MF A01

A typical viscoplastic model will introduce up to three types of internal state variables in order to properly describe transient material behavior; they are as follows: the back stress, the yield stress, and the drag strength. Different models employ different combinations of these internal variables--their selection and description of evolution being largely dependent on application and material selection. Under steady-state conditions, the internal variables cease to evolve and therefore become related to the external variables (stress and temperature) through simple functional relationships. A physically motivated hypothesis is presented that links the kinetic equation of viscoplasticity with that of creep under steady-state conditions. From this hypothesis one determines how the internal variables relate to one another at steady state, but most importantly, one obtains bounds on the magnitudes of stress and back stress, and on the yield stress and drag strength. INTEGRATED APPROACHES TO PARALLELISM IN OPTIMIZATION AND SOLUTION OF INVERSE PROBLEMS Final Report, 15 May 1989 - 31 Mar. 1992
William Symes 1 Jan. 1993 3 p Limited Reproducibility: Document partially illegible
(Grant AF-AFOSR-0363-89)
(AD-A262259; AFOSR-93-0196TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Mathematical models for mechanical design problems and development of analytical and numerical tools for their solution was studied under this grant. The mathematical problems separate into ones of rods and membranes. Regarding the former, with M. Overton, the PI provided the first rigorous study of the shape of the strongest rod. In particular, within the context of the Euler-Bernoulli model, we established existence, necessary conditions, regularity, and a general, though efficient, means of computing an optimal shape. Previous studies had not fully dealt with the fact that the strength of a rod (the axial load under which it commences to bucle) need not be a differentiable function of its shape. The Mathematical Intelligence solicited an expository account of this work. This article was picked up by Discover magazine, where the review appears. Engineers in off-shore oil rig design at Exxon Production Research in Houston have approached the PI regarding the research. Via the rolling of thin plates they have the means to create rods with piecewise conical cross-sections. With J. Maddocks, the PI has extended all of the above analytical findings to a much richer class of rods. In particular, they are able to accommodate hyperelastic rods with nonlinear bending laws and vanishing cross-sections in both the interior and at the boundary. In this new framework, they are also finally able to carefully pose and settle bifurcation questions as to whether the branches of equilibria stemming from the buckling load of the optimal column are indeed supercritical, i.e., rightward. A RIEMANN PROBLEM FOR AN ELASTIC BAR THAT CHANGES PHASE Technical Report No. 10
Yier Lin Nov. 1992 45 p
(Contract N00014-90-J-1871)
(AD-A262827) Avail: CASI HC A03/MF A01

This paper is concerned with the dynamics of an elastic bar that can undergo reversible stress-induced phase transformations. We consider a Riemann problem in which the initial strains belong to a single metastable phase and prove uniqueness of solution that satisfy a nucleation criterion and a kinetic law at all subsonic and sonic phase boundaries. This paper generalizes the results of a previous paper, which considered a piecewise linear material for which the following are true: no wave fans exist, shock waves always travel at the acoustic speed, and shock waves are dissipation-free. The material model of the present paper does not suffer from these degeneracies. DTIC

(AD-A262997; TR-4) Avail: CASI HC A03/MF A01

We have used the newly developed interfacial force microscope (IFM) to study the adhesive and mechanical properties of a Au substrate. We show that a W probe interacting with a Au surface results in plastic deformation under very small repulsive loads and transfers Au to the probe surface in a galling interaction upon removal. However, when the Au surface is passivated by a self-assembling monolayer of n-docosanethiol molecules ($CH3(CH2)21SH$), the substrate is able to elastically support large repulsive loads with no attractive interactions. Within this elastic region, the load/deformation relationship closely follows the classic Hertzian model for a rigid punch deforming an elastic half space. As a result, we are able to determine the maximum values for the shear-stress threshold for plastic deformation to be approximately 1 GPa in agreement with theoretical determinations. Above this value, the substrate permanently deforms. Remarkably, however, the strong binding of the molecular film to the Au surface permits it to maintain its passivating properties even after gross plastic damage. DTIC

The determination of crack lengths in an accurate and straight forward manner is very useful in studying and preventing load created flaws and cracks. A crack length sensor according to the present invention is fabricated in a rectangular or other geometrical form from a conductive powder impregnated polymer material. The long edges of the sensor are silver painted on both sides and the sensor is then bonded to a test specimen via an adhesive having sufficient thickness to also serve as an insulator. A lead wire is connected to each of the two outwardly facing silver painted edges. The resistance across the sensor changes as a function of the crack length in the specimen and sensor. The novel aspect of the present invention includes the use of relatively uncomplicated sensors and instrumentation to effectively measure the length of generated cracks. Monomer cholesteric liquid crystals have helical structures which result in a phenomenon known as selective reflection, wherein incident white light is reflected in such a way that its wavelength is governed by the instantaneous pitch of the helix structure. The pitch is dependent on temperature and external stress fields. It is possible to use such monomers in flow visualization and temperature measurement. However, the required thin layers of these monomers are quickly washed away by a flow, making their application time dependent for a given flow rate. The laminate structure according to the present invention comprises a liquid crystal polymer substrate attached to a test surface of an article. A light absorbing coating is applied to the substrate and is thin enough to permit bonding steric interaction between the liquid crystal polymer substrate and an overlying liquid crystal monomer thin film. Light is directed through and reflected by the liquid crystal monomer thin film and unreflected light is absorbed by

the underlying coating. The wavelength of the reflected light is indicative of the shear stress experienced by the test surface. Novel aspects of the invention include its firm bonding of a liquid crystal monomer to a model and its use of a coating to reduce interference from light unreflected by the monomer helical structure.

THE EFFECT OF MATERIAL STRENGTH ON SEGMENT PENETRATION BEHAVIOR Final Report, Jan. 1992 - Feb. 1993
Todd W. Bjerke Apr. 1993 23 p
(DA Proj. 1L1-62618-AH-80)
(AD-A263262; ARL-MR-51) Avail: CASI HC A03/MF A01

The effects of penetrator material strength on the terminal ballistic behavior of tungsten alloy segments fired into armor plate was determined by a series of impact experiments. Three different strength tungsten alloys were machined into cylinders with an aspect ratio of 4 and were subsequently impacted into rolled homogeneous armor at 1.5 km/s. The depth of penetration and the shape of the penetrator material remaining in the penetration cavity were recorded and compared. Decreasing the penetrator material strength was observed to slightly decrease the length of residual material and the depth of penetration. The diameter of the plastically deformed residual material was observed to increase with decreasing penetrator material strength. DTIC

AN EXPERIMENTAL/ANALYTICAL EVALUATION OF BIAXIAL SHEET FAILURE
K. L. Lee, S. L. Brandon, M. F. Horstemeyer, and J. S. Korellis Mar. 1993 26 p
(Contract DE-AC04-76DR-00789)
(DE93-010620; SAND-93-8226) Avail: CASI HC A03/MF A01

An experimental test system has been developed to support numerical modeling analysis of sheet metal failure. The system consists of a planar biaxial test frame, cruciform specimens and grips, and custom software to control the frame's actuators. Thin aluminum 6061-0 specimens are loaded to the point of incipient failure under different biaxial stress ratios. The data from these tests are used in validating a constitutive plasticity/failure model for aluminum 6061-0 by comparison with finite element predictions. DOE

BALANCED TECHNOLOGY INITIATIVE ON COMPUTATIONAL MECHANICS OF MATERIALS Final Technical Report, 15 Aug. 1989 - 30 Sep. 1991
Robert J. Asaro 7 Apr. 1993 4 p
(Contract N00014-89-J-3235)
(AD-A263906) Avail: CASI HC A01/MF A01

The goal of this project, which was part of the DARPA Balanced Technology Initiative on Computational Mechanics, was to develop a comprehensive approach to the numerical modeling of the mechanical behavior of materials. Particular areas for focus in the project were the inelastic deformation of highly anisotropic materials such as single crystals and textured polycrystals, as well as evolving microstructural damage in ceramics and ductile metals in both slow and high rate deformation processes. While the contract was awarded for a period of three years, it was actually funded only for the first year. Nonetheless, significant progress can be reported as a direct result of this project. DTIC

TWO-PARAMETER CRACK TIP FIELD ASSOCIATED WITH STABLE CRACK GROWTH IN A THIN PLATE: A HYBRID ANALYSIS Technical Report, Jun. 1992 - Apr. 1993
G. B. May, F. X. Wang, and A. S. Kobayashi Apr. 1993 20 p
(Contract N00014-89-J-1276)
(AD-A264221; UWA/DME/TR-93-71) Avail: CASI HC A03/MF A01

Moire interferometry was used to determine the two orthogonal displacement fields surrounding a stably growing crack in a thin 2024-T3 aluminum alloy, single-edge notched (SEN) specimen. The measured displacements were used to compute the J-integral and the associated HRR and the second order Q displacement fields. Also, a 2-D elastic-plastic finite element model of the fracturing specimen was executed in its generation mode to compute the crack tip displacement field and the J-integral for small crack extension. The numerically computed and experimentally derived J-values agreed prior to crack extension but differed increasingly with stable crack growth. The HRR and measured v-displacements agreed well but significant difference between the HRR and measured u displacements was noted. Thus, the Q component of the v-displacement was negligible but the corresponding u-component varied nonlinearly with radial distance from the crack tip. DTIC

DAMAGE MECHANICS IN 2-D AND 3-D MICROSTRUCTURES Final Report, Jul. 1989 - Jun. 1992
Keith J. Bowman and Martin Ostoja-Starzewski 26 Feb. 1993 50 p
Prepared in cooperation with Michigan State University
(Grant AF-AFOSR-0423-89)
(AD-A264337; AFOSR-93-0213TR) Avail: CASI HC A03/MF A01

The evolution of damage and strategies for assessing damage when it has occurred in structural materials is the primary focus of this research program. The research effort is a collaborative one on mesomechanics called 'Damage in 2D and 3D Microstructures.' What distinguishes this effort from others is the attempt to perform incisive model experiments to assist in evaluating stochastic models for constitutive laws (elasticity and conductivity), mechanical response plasticity, and hardness and associated damage processes. The theoretical models are designed to be elegant and efficient in the use of computing resources as opposed to brute force procedures which handle systems with different scales by scaling up the size of the computer. The essence of this work is to explore sample size microstructure relationships via stochastic models which reflect the same types of variability present in the response of real materials. This leads directly to concerns with effective properties of materials. Thus, research integrates the effects of microstructure and preferred orientation on the effective tensorial properties of polycrystalline materials. DTIC

STRESS-INTENSITY-FACTOR INFLUENCE COEFFICIENTS FOR AXIAL AND CIRCUMFERENTIAL FLAWS IN REACTOR PRESSURE VESSELS
J. W. Bryson and T. L. Dickson 1993 20 p Presented at the Pressure Vessel and Piping Conference, Denver, CO, 25-29 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE93-006206; CONF-930702-4) Avail: CASI HC A03/MF A01

Weight-function techniques in linear elastic fracture mechanics utilize stress-intensity-factor influence coefficients K* and superposition principles to compute stress intensity factors. This paper presents influence coefficients for two flaw geometries often employed in fracture analyses of reactor pressure vessels: (1) infinitely long, axial, inside-surface flaws and (2) 360 degree, circumferential, inside-surface flaws. Calculations were performed using ABAQUS, a nuclear quality assurance (NQA-1) certified finite-element program which employs a highly accurate crack extension technique for the computation of the J-integral. Influence coefficients are computed for flaw depths in the range 0.01 less than or = a/T less than or = 0.9 with particular emphasis on shallow flaws (a/T less than or = 0.1). This study addresses vessels having R/T = 10 which is appropriate for most PWR's in USA. The influence coefficients have been implemented in the FAVOR fracture-mechanics code currently being developed under the NRC-funded HSST Program at ORNL. DOE

STATIC AND DYNAMIC LARGE DEFLECTION FLEXURAL RESPONSE OF GRAPHITE-EPOXY BEAMS
Mark D. Sensmeier, O. Hayden Griffin, Jr., and Eric R. Johnson Washington Mar. 1988 251 p
(Grant NAG1-343; RTOP 505-63-01-11)
(NASA-CR-4118; NAS 1.26:4118; VPI-E-87-7) Avail: CASI HC A12/MF A03

An experimental and analytical study of large deflection flexural response of graphite-epoxy beams subjected to eccentric axial compression was conducted. The beam specimens were subjected to axial impact and to static axial loads, in order to assess the damage caused by impact. A one-dimensional geometrically and materially nonlinear finite element model was developed to predict static beam response. The model incorporated width-wise effects by assuming specific forms of the displacements across the width, with lengthwise variation introduced as a degree of freedom. The resulting 22 degree of freedom element accurately predicted the load deflection and strain-deflection responses of the static test specimens. Author (revised)

A CERAMIC FRACTURE MODEL FOR HIGH VELOCITY IMPACT Final Report, Oct. 1985 - Feb. 1993
William H. Cook May 1993 184 p
(AF Proj. 2302)
(AD-A264728; WL-TR-93-7023) Avail: CASI HC A09/MF A02

The objectives of this research program were to develop, implement, and demonstrate a failure model for aluminum oxide ceramic under impact loading. A comprehensive test program for Coors AD-85 was conducted. Four types of experiments provided a basis for the development of the ceramic failure model. A phenomenological damage-based failure model for compressive fracture of impacted aluminum oxide was developed with emphasis placed on predicting fragment sizes of failed ceramic. Test data suggested a fragment size correlation with loading rate. A model was developed incorporating the data and implemented in the EPIC hydrocode. Comparisons of the results of this model to penetration test were positive. DTIC

VIBRATION LOCALIZATION IN ROTATING SHAFTS Ph.D. Thesis
Suhyun Choi 1992 155 p
Avail: Univ. Microfilms Order No. DA9308289

The mode localization phenomenon between two orthogonal principal directions in flexible rotating shafts with slightly dissimilar lateral moments of inertia is investigated theoretically and experimentally. A consistent model is derived which describes the flexural vibration in two orthogonal planes, and the torsional vibrations of a straight rotating Timoshenko shaft with dissimilar lateral principal moments of inertia subject to a constant compressive axial load. In particular, a new approach for calculating correctly the effect of an axial load for a Timoshenko beam is developed based on the change in length of the centroidal line. The analysis of mode localization in a rotating shaft is carried out in an exact closed-form for a Rayleigh beam model using a separation of variables approach, and using a Galerkin approximation and perturbation methods which yield insights into the occurrence of localization. The analysis of eigenvalue loci veering is also performed using the perturbation techniques. Analytical and numerical results for a rotating shaft with simply supported, and with fixed-free, boundary conditions are presented: (1) the parameters which determine the degree of vibration localization are the difference between the two lateral moments of inertia, the rotational speed of the shaft, and the mode number; (2) for the strongly coupled case, the classical perturbation solutions are good approximations to the exact solutions; (3) for the weakly coupled case, the first-order modified perturbation solutions provide good approximations, and the second-order results yield excellent agreement with the exact solutions except for very small values of disorder; and (4) for the weakly coupled system, both strong localization and eigenvalue loci veering occur. To verify the theoretical results, a series of experiments are performed. Measurements of the natural frequencies are presented for non-rotating/rotating and tuned/mistuned shafts with simply supported boundary conditions. The localization phenomenon was demonstrated through measurements of the forced response due to unbalanced mass. The results of the theoretical and experimental studies indicate that indeed localization may occur in rotating shafts. Dissert. Abstr.

A CONTINUUM CODE INVESTIGATION OF STRESS INTEGRATION USING EXACT AND APPROXIMATE MATERIAL ROTATION
R. F. Davidson and P. J. Maudlin Nov. 1992 28 p
(Contract W-7405-eng-36)
(DE93-001892; LA-12389-MS) Avail: CASI HC A03/MF A01 (US Sales Only)

The accuracy of the Zaremba-Jaumann-Noll stress rate (referred to as the Jaumann Stress Rate) used in various continuum mechanics codes is investigated using two realistic warhead formation problems that involve isotropic plasticity, large deformations, and large rigid body rotation. It was demonstrated in the literature for simple problems that, although the Jaumann Stress Rate is objective (i.e., under superimposed rigid body rotation, it transforms in like manner as the stress or strain rate), it is not kinematically consistent because it uses the anti-symmetric part of the velocity gradient tensor to approximate rigid body rotation. A theoretically correct approach would use an objective stress rate that is kinematically consistent via the use of the exact rigid body rotation rate. It is shown that, although the Jaumann Stress Rate is sufficiently accurate for gross deformation, inspection of the stress-strain details show kinetical errors. The computational expense of using an exact rotation rate is shown to be insignificant. DOE

THE CONTACT MECHANICAL NONLINEARITIES OF A MATHEMATICAL MODEL OF A RAILWAY WHEEL ROLLING OVER CORRUGATED RAIL
Jerzy Piotrowski Sep. 1991 43 p
(ILR-Mitt-266(1991); ETN-93-94171) Avail: CASI HC A03/MF A01

The results of the investigations carried out on possible nonlinear contact mechanical effects of a wheel rolling over corrugated rail are discussed. The applied method of investigation takes as a starting point normal force and creep variations calculated by using a linear model of corrugations. Predicted normal loads between wheel and rail were taken as an input for the solution of the normal contact problem using an approximate, numerical method for non-Hertzian contact. The results of normal contact calculations were analyzed from the point of view of the geometry of contact and basic contact mechanical quantities which influence vertical dynamics of the system, generating the creep forces and wear. Similar analysis was carried out for Hertzian assumptions with the use of the same method for non-Hertzian normal contact problem. The main conclusion arrived at is that the discrepancies due to Hertzian description of the contact mechanical part of the linear model against the non-Hertzian description are most strongly pronounced when the wheel traverses the trough of the corrugation and, that might lead to the significant overall discrepancies in predictions obtained with the two different contact mechanical parts of the model. ESA

THE STEADY-STATE TANGENTIAL CONTACT PROBLEM FOR A FALLING DROP TYPE OF CONTACT AREA ON CORRUGATED RAIL BY SIMPLIFIED THEORY OF ROLLING CONTACT

Jerzy Piotrowski Oct. 1991 30 p
(ILR-Mitt-267(1991); ETN-93-94172) Avail: CASI HC A03/MF A01

Investigation of contact mechanical nonlinearities of a mathematical model of corrugation revealed that the typical shape of contact patch resembles a falling drop of water. A contact patch of that shape was approximated with a figure composed of two parts of ellipses with different eccentricities. The contact pressure distribution was assumed as a smoothing ensemble of two paraboloidal distributions. The description of a general case of double half elliptical contact area was given but a special case of double half elliptical contact is more interesting as it possesses some Hertzian properties. It was shown how three geometrical parameters of double half elliptical contact can be chosen when actual, non-Hertzian contact is known. A linear theory was written which indicates that the lateral vibrations of the rail may be excited only due to shape variation on corrugation even if any other cause for these vibrations does not exist. For nonlinear theory a computer program, based on FASTSIM algorithm by Kalker, was written. The aim is to calculate the creep forces and frictional power density distribution over the contact area. Also, a graphic program visualizing the solution was written. Numerical results are not provided; unattended and unsolved problems relevant for this type of contact are listed. ESA

DETERMINATION OF LOW FREQUENCY REFERENCE SLIPPING FOR HIGH FREQUENCY UNSTATIONARY MOTION PROCESSES [ERMITTLUNG NIEDERFREQUENTER REFERENZSCHLUEPFE FUER HOCHFREQUENTE, INSTATIONAERE BEWEGUNGSVORGAENGE]

Sebastian Stichel 1992 49 p In GERMAN
(ILR-Mitt-273(1992); ETN-93-94173) Avail: CASI HC A03/MF A01

Slips and slipping forces, which occur by unrolling of the set of wheels in a defective rail, are obtained in reference states, with focus on locomotive propulsion parameters influence in hackle formation. It is assumed that rail defects are described by a stochastic distribution and that slipping properties can be determined by the quadratic mean value of low frequency reference states. Calculations were performed by linear vehicle models with the covariance method. Geometric quantities for the wheel/trail contact are identical for all parameter variations. The results show a real dependence of slipings on vehicle excitation intensity. Calculations were carried out with the spectral density method and were shown to be in agreement, but the covariance method is proved to be a more rapid numerical process. ESA

THEORETICAL AND EXPERIMENTAL INVESTIGATION OF SLACK CABLE/MASS SYSTEM DYNAMICS Ph.D. Thesis

Hai-Ping Lin 1992 177 p
Avail: Univ. Microfilms Order No. DA9308381

A theoretical model is presented that describes the three-dimensional nonlinear motion of a sagged cable that supports an array of discrete masses. A closed-form solution procedure is used to determine the equilibrium state of an arbitrarily suspended cable with an arbitrarily complex mass array. The equations of motion are linearized about equilibrium and the natural frequencies and mode shapes are determined from the associated eigenvalue problem governing free response. A global discretization based on Galerkin's method is used to solve this eigenvalue problem. With a judicious choice of the admissible functions, the convergence of the eigensolutions can be substantially accelerated over that found using 'traditional' admissible functions. A convergence study is pursued to determine the source of accelerated convergence. It is also noted that the convergence problem associated with the cable/mass system is generic. Similar convergence problems arise in other structural dynamics applications where the eigenfunctions have limited continuity; e.g., structures containing discrete elements, voids, or concentrated loads. The numerical results reveal that, for a general cable/mass system, there are three principal transitions in the frequency spectrum as the suspension parameter lambda(sup 2) is varied. These include: (1) rod-string transition, (2) the string/inextensible cable transition, and (3) slack cable transition. While the first two transitions have been noted in the previous studies, the third one has not. During this third transition, the cable is nearly decoupled into a number of segments and the vibration modes become localized. An asymptotic/numerical solution is also derived based on the assumptions of piecewise constant equilibrium cable tension and equilibrium inclination angle distributions. The advantage of this asymptotic/numerical solution is its ability to provide results for higher-order eigensolutions of complex mass arrays. Experimental results based on the measurements of frequency response functions are provided and serve to validate the theoretical model. Dissert. Abstr.

ON NEURAL NETWORKS IN IDENTIFICATION AND CONTROL OF DYNAMIC SYSTEMS

Minh Phan (Lockheed Engineering and Sciences Co., Hampton, VA.), Jer-Nan Juang, and David C. Hyland (Harris Corp., Melbourne, FL.) Jun. 1993 34 p
(RTOP 585-03-11-09)
(NASA-TM-107702; NAS 1.15:107702) Avail: CASI HC A03/MF A01

This paper presents a discussion of the applicability of neural networks in the identification and control of dynamic systems. Emphasis is placed on the understanding of how the neural networks handle linear systems and how the new approach is related to conventional system identification and control methods. Extensions of the approach to nonlinear systems are then made. The paper explains the fundamental concepts of neural networks in their simplest terms. Among the topics discussed are feed forward and recurrent networks in relation to the standard state-space and observer models, linear and nonlinear auto-regressive models, linear, predictors, one-step ahead control, and model reference adaptive control for linear and nonlinear systems. Numerical examples are presented to illustrate the application of these important concepts. Author (revised)

The Mapping Science Committee (MSC) was established in 1987 at the request of the U.S. Geological Survey (USGS) to provide advice on their cartographic and geographic activities. During the course of its studies, the MSC was exposed to activities in several other federal agencies and recognized several generic problems involving the conduct of mapping and spatial analysis. In response to the initial charges developed for the earlier USGS activity, the MSC issued two reports, Spatial Data Needs: The Future of the National Mapping Program (1990) and Research and Development in the National Mapping Division, USGS: Trends and Prospects (1991). In both reports, the MSC recognized the utility of its advice to the broader governmental agencies that utilize mapping or the analyses of spatially referenced digital data. Because of this recognition, the MSC initiated this study. The question that this study addresses is the following: What could be done better or more efficiently if the content, accuracy, organization, and control of spatial data were different? The study examines the current national spatial data infrastructure, encompassing the roles of private institutions as well as local, state, and federal governments in using and sharing geographic information. In addition it identifies barriers that prevent these groups from acquiring knowledge, making decisions, or performing the duties that rely on the timely availability and easy access to an organized body of geographically referenced information. The scope of spatial data can be enormous, and spatial data can be important components of a wide variety of scientific, technical, and social disciplines and applications. The MSC focused its efforts on the generic issues of spatial data management, collection, and use, particularly regarding the data bases that drive geographic information systems and other similar methods of analyses. The application potential of data from NOAA, LANDSAT, and ERS-1 satellites was presented in 18 scientific papers. The main emphasis was on the processing and application of radar data as well as preparations for the ERS-1. Another important subject was the results of applications in forestry in the old and new German Federal States, in Alpine regions and the Soviet Union, investigations in urban areas and for monitoring in Kenya. Status reports were given on the funding concept of ecological research of the Federal Ministry of Research and Technology (BMFT), on the International Space Year (ISY 92), and on the processing and archiving of data of the ERS-1. For individual titles, see N93-28916 through N93-28932.

The first European remote sensing ERS-1 satellite was launched in 1991 on a polar orbit for environmental observations. Data processing and product distribution are carried out in four centers, namely Processing and Archiving Facilities (PAF). The German PAF is involved in high precision data processing. The most important Synthetic Aperture Radar (SAR) products are: precision image, geocoded ellipsoid corrected image, and geocoded terrain corrected image. A sensor calibration by the European Space Agency and a careful validation of products by the PAF must be carried out before product delivery to users. ESA

Wolfgang Bosch *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 16-17 In GERMAN Original contains color illustrations (For primary document see N93-28915 11-43)

Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The possibilities of satellite altimetry for sea surface measurements and time variations are described. Double measurements analysis allow an increase of satellite flight precision by interpolation in the cross points of up and down flight curves. Models for height errors are then determined by compensation to reduce flight errors. With knowledge of the improved satellite attitude and careful corrected shift measurements of the altimeters, sea level curves can be calculated along the subsatellite tracking. By interpolation these levels are finally transferred onto a regular grid. Altimeter data are systematically archived and processed to obtain a relief representation of the sea level surface. ESA

EXACT TRAJECTORY DETERMINATOR FOR ERS-1 [GENAUE BAHNBESTIMMUNG FUER ERS-1]

Franz-Heinrich Massmann *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 18-20 In GERMAN (For primary document see N93-28915 11-43)

Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The calculation of temporary and precise flight ephemerides was performed in German processing and archiving facilities. These exact trajectories can be used for correction of ERS-1 Earth observation measurements. Initially, only laser and radar altimeter observations were available for trajectory calculations. These were more precise after classification of data materials and files and geographic distribution and when the measure concept was demonstrated. The worldwide distributed laser stations transfer the data to German processing and archiving facilities. Trajectory determination is carried out by means of a geodetic parameter estimation system. Motion equations are numerically integrated in a trajectory determination module by taking into account perturbation factors, and the trajectory is then iteratively improved. ESA

THE INTERFEROMETRIC SAR TECHNOLOGY AND ITS USABILITY IN THE FRAMEWORK OF ERS-1 [DIE INTERFEROMETRISCHE SAR-TECHNIK UND IHRE NUTZUNGSMOEGLICHKEITEN IM RAHMEN VON ERS-1]

Philipp Hartl *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 21-23 In GERMAN (For primary document see N93-28915 11-43)

Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

Phase measurement of radar echo by interferometric SAR (Synthetic Aperture Radar) technology is explained. Data of at least two recordings of the sample scene must be simultaneously processed provided that they are issued from narrowly neighboring satellite positions and no differences in direction slant range occur. These differences are measured point by point while the phase differences of corresponding echo signals are evaluated. Since two points with equal geographic coordinates and different topographic height have a different direction angle, this can be measured by interferometry and a digital height model can be obtained. The method is shown to be hardly usable for surfaces with strong reliefs and for forests, because radar scattering properties of observed surfaces must be time-independent. ESA

RECORDING OF FOREST SURFACE IN SAR-IMAGES WITH STATISTICAL METHODS IN AREAS OF PRONOUNCED RELIEF [ERFASSUNG DER WALDFLAECHE IN SAR-BILDERN MIT HILFE STATISTISCHER METHODEN IN GEBIETEN MIT AUSGEPRAEGTEM RELIEF]

F. Holecz and D. Nueesch *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 24-27 In GERMAN (For primary document see N93-28915 11-43)

Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The correction of the SAR (Synthetic Aperture Radar) images for an optimal interpretation, is studied. Measure noises were considered, such as speckle effect and geometric or radiometric distortions. Appropriate adaptative filters must be chosen, and a correction process based on a distance Doppler algorithm must be used, to build a topographic map. Errors can be minimized through optimal image raster width and interpolation process. Interaction between incident microwaves and natural surfaces, topographical influence on obtained signatures, statistic or semi-empirical backscattering model, as well as a parameter for precise relief detailing, play an important role in the quality of information recovery. To statistically describe the anisotropic texture of a forest, Gray level run length matrix, Gray level difference matrix, spatial Gray level dependence matrix, and the power spectrum method were used. Another method, related to the extraction of basis vectors with an adaptive system, was used to calculate eigenvectors and eigenvalues from the covariance matrix, which gives an approximation of second order or statistical dependences. REMOTE SENSING OF AGRICULTURAL VEGETATION: STATUS AND PERSPECTIVES [FERNERKUNDUNG DER LANDWIRTSCHAFTLICH GENUTZTEN VEGETATION: STAND DER ANWENDUNG UND PERSPEKTIVEN]

W. Kuehbauch *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 32-34 In GERMAN (For primary document see N93-28915 11-43)

Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The possibilities of optical and microwave sensors for variety identification and situation descriptions of cultivated plants are reviewed. It is important to develop model formulations in which the plant cover can be defined in simple geometric coordinates. It is proved that for vegetation cover description by optical sensors the interpretation is better in red/infrared area and a good estimation of plant biomass and its chlorophyll content can be obtained. High resolution spectroscopy allowed measurement of nitrogen fertilizing effect in meadowland. It is concluded that remote sensing can be used for agriculture only by combining data with other information sources such as statistics and geologic or meteorologic charts. ESA

SAR SHAPE-FROM-SHADING FOR A POPULATED ALPINE AREA [SAR SHAPE-FROM-SHADING FUER EIN BESIEDELTES ALPINES GEBIET]

Rolf Hartmann *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 35-39 In GERMAN Original contains color illustrations (For primary document see N93-28915 11-43)

Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The use of satellite-borne radar recordings for developing digital ground models is explained. Shape-from-shading methods allow a ground height value to be assigned to each image pixel with high spatial resolution. These processes are full of serious reconstruction faults at lower spatial frequencies, due to nonhomogeneity of radar backscattering coefficients, integration methods, radiometric calibration and speckle noise of radar signal. It is established that angle dependence of radar backscattering coefficients can be neglected and geometry factor of radar cross section linearly depends on height difference in the image pixel in range direction, so that linear filter can be used to estimate errors in reconstructed height values. ESA

UTILIZATION OF NOAA/AVHRR DATA FOR ENERGY BALANCE OF LAKE CONSTANCE (SWITZERLAND) [DIE ANWENDUNG VON NOAA-AVHRR DATEN ZUR ENERGIEBILANZIERUNG DES BODENSEES]

Karl Schneider and Wolfram Mauser (Technische Univ., Munich, Germany.) *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 50-53 In GERMAN Original contains color illustrations (For primary document see N93-28915 11-43)

Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The use of satellite data to allow direct and extensive measurements of some parameters involved in energy fluxes at water surface in a lake is shown. By means of continuous radiometric measurements of surface temperature, upper water column temperature curves and meteorological parameters, the effect of energy fluxes in boundary surface temperatures can be examined. A modified split-window process and the radiation transfer model LOWTRAN-7 were used for atmosphere corrections of temperature images from NOAA/AVHRR (Advanced Very High Resolution Radiometer). The energy balance was calculated from energy fluxes between atmosphere and water, as the sum of latent and conduction heat from short and long wave radiation and long wave transmission. ESA

DERIVATION OF CONDUCTIVE HEAT TRANSFER IN MOUNTAINS FROM AVHRR DATA [DIE ABLEITUNG DES FUEHLBAREN WAERMESTROMES IM GEBIRGE AUS AVHRR-DATEN]

Hermann Mannstein *In its* Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 54-57 In GERMAN Original contains color illustrations (For primary document see N93-28915 11-43)

Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The conductive heat transfer can be calculated from AVHRR (Advanced Very High Resolution Radiometer) data and measurements of air temperature profiles by taking into consideration height information of a digital ground model. It is described as a function of surface roughness atmosphere state and slope and was estimated apart from simulations of up-slope boundary layers, which establish a relation between conduction heat and temperature difference between ground and free atmosphere. This method allows an extensive recording of data and a pixel integration in a surface defined by the sensor geometric resolution. ESA

DIGITAL IMAGE PROCESSING OF DESCANNED TERRESTRIAL GROUND PHOTOGRAPHS [DIGITALE BILDVERARBEITUNG AN ABGESCANNTEN TERRESTRISCHEN GELAENDEFOTOS]
Ingrid Stengel *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 58-63 In GERMAN Original contains color illustrations (For primary document see N93-28915 11-43)
Avail: CASI HC A02/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The problem of the bad quality of photographs of sandy terrains such as deserts and dunes is studied. The possibilities of improvement by digital image processing are examined: normed or interactive histogram spreading for a stronger contrast, equidensity lining for distinguishing areas of same color, luminosity, exposition, slope and grain size, and reduction of indistinctness by high-pass filtration. Image processing for separation of surface textures from various directions is given as an example: the original picture was recorded at a plane aeolicen sand layer in the North Sea, which resulted from accumulations due to several wind directions and intensities. Sand layer surface was weakly and diffusively wrinkled with very regular crest shifts, so that shadow gives little information. Image contrast was optimized and specially defined direction filtration (5 by 5 pixel matrix) was applied to examine crest distribution of sand layer. ESA

ATMOSPHERIC CORRECTION OF LANDSAT-TM-DATA FOR FOREST INVENTORY [ATMOSPHAERENKORREKTUR VON LANDSAT-TM-DATEN FUER ZWECKE DER FORSTINVENTUR]
Gilbert Kattenborn *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 64-67 In GERMAN Original contains color illustrations (For primary document see N93-28915 11-43)
Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

An algorithm is presented for atmospheric correction of multispectral satellite data in solar spectral area. This process was achieved and tested for forest evaluations of LANDSAT-TM (Thematic Mapper) recordings above distorted relief but can be adapted to other sensors and similar problems. A routine identifies surfaces with thick, dark vegetation as objects of well known reflection, according to a vegetation index and a low reflection in near infrared area. A net of reference points can then be stretched. These points are chosen to represent horizontal, terrain dependent or vertical variations of atmospheric conditions and allow calculation of transmission, air light and irradiation values with LOWTRAN-7 software. A three dimensional model of current and local atmosphere conditions in the considered region is, therefore, obtained. After estimation of mean region albedo, atmosphere corrected albedos are calculated by considering the isotropic reflection of the surface with iterative utilization of a correction model. ESA

EVIDENCE-BASED CLASSIFICATION OF SATELLITE IMAGE DATA [EVIDENZBASIERTE KLASSIFIZIERUNG VON SATELLITENBILDDATEN]
Gabriele Lohmann *In its* Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 72-73 In GERMAN (For primary document see N93-28915 11-43)
Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

A new method for classification of satellite image data is presented which is particularly adapted to cartography of forest regions in Germany but can be applied to other areas such as tropical rain forests. The process is based on varied distribution functions and several independent feature spaces, which are considered as 'sources of evidence' according to the Dempster-Shafer Theory. The method allows the identification of information from different sources, for example several sensors. ESA

NEW CLASSIFICATION METHODS [NEUE KLASSIFIZIERUNGSMETHODEN]
Helmut Schumacher *In* DLR, Proceedings of the 8th User Seminar of the German Remote Sensing Data Center of the German Aerospace Establishment (DLR) May 1992 p 74-75 In GERMAN (For primary document see N93-28915 11-43)
Avail: CASI HC A01/MF A01; DLR, Zentrale Allgemeine Dienste, Versand, Postfach 90 60 58, 5000 Cologne 90, Germany, HC

The implementation of the maximum likelihood method is proposed by carrying out a component transformation by class. The robustness of this implementation towards badly conditioned covariance matrices is demonstrated. Fuzzy sets were used and distances to cluster centers were reproduced in the classes according to their membership degree to obtain fuzzy classifications. Beside the use of by class-different features and of various classifications inside a classification operation, a new formulation arises for the multitemporal classifying, and consequently a new method is proposed for realization of a geocoded thematic database. Performances of the method are demonstrated by means of synthetic and real thematic mapper data and by comparison with probabilistic relaxation process. ESA

EARTH OBSERVATION FROM SPACE: COMPETITION OR COOPERATION? Research Report, Aug. 1991 - Apr. 1992
David P. Oberthaler Apr. 1992 36 p
(AD-A262044; NDU-ICAF-92-A208) Avail: CASI HC A03/MF A01

The purpose of this paper is to examine how the United States should balance its international cooperation and competition as it pertains to earth observations or remote sensing from space. Earth observations or remote sensing includes all forms of observation by sensors borne by a space object including visual, optical or any form of radiometrically produced images and any measurements taken of the earth's surface, its atmosphere or its weather systems. The capabilities of remote sensing are as varied as the sensors that are built and put in orbit, but capabilities fall into two general categories; imagery and measurement. Imagery includes visible light photography, infrared photography, and radar images of the earth's surface. Imagery also has the broadest application cutting across scientific, economic and national security lines. Accurate and detailed images of the earth's surface can be produced through cameras, radar, and specialized scanners to improve the accuracy of maps, observe and assist in weather reporting and prediction, assess the impact of man on his environment, and assess the status of crops and natural resources. Measurement accomplished using remote sensing has largely scientific applications including the production of data on the chemical composition of the earth's atmosphere, measurement of radiation, and precise measurement of landmass position and movement. REMOTE SENSING SURVEY OF MISSISSIPPI RIVER-GULF OUTLET, BRETON SOUND DISPOSAL AREA, PLAQUEMINES PARISH, LOUISIANA Final Report
Jack D. Irion, Peter Morrison, Paul V. Heinrich, and Danton Kostandarithes

Feb. 1993 80 p
(Contract DACW29-90-D-0018)
(AD-A263097; COELMN/PD-93/05) Avail: CASI HC A05/MF A01

A magnetic and acoustic remote sensing survey for submerged cultural resources was conducted over a 1,600-acre project area off shore of Breton Island, Plaquemines Parish, Louisiana. The project area, which measures a mile wide and 2.5 miles long, encompasses the proposed site of the Mississippi River-Gulf Outlet Breton Sound Disposal Area. The survey was conducted for the U.S. Army Corps of Engineers, New Orleans District, pursuant to Delivery Order 0010, of Contract DACW29-90-D-0018. The proposed disposal of dredge spoil may impact several of the anomalies recorded during the survey. A controlled hydrographic survey was performed over the project area utilizing a proton precession magnetometer to collect magnet data, a side scan sonar to record acoustic anomalies, and a precision echosounder to acquire bathymetry. Real time positioning was maintained by a Differential Global Positioning System (DGPS) linked to a computer navigation program. Seventy-eight magnetic anomalies and one acoustic anomaly were recorded during the survey. The acoustic anomaly, which is associated with a cluster of magnetic targets, appears to be related to modern steel wreckage. In addition to this target, six other clusters of anomalies were distinguished. Of the seven anomaly clusters, additional archeological investigations are recommended for five. DTIC

INVESTIGATION OF A GEODESY COEXPERIMENT TO THE GRAVITY PROBE B RELATIVITY GYROSCOPE PROGRAM Final Report, Jun. 1993
C. W. F. Everitt, Bradford W. Parkinson, and Mark Tapley 25 Jun. 1993 14 p
(Grant NAG5-1155)
(NASA-CR-193263; NAS 1.26:193263) Avail: CASI HC A03/MF A01

Geodesy is the science of measuring the gravitational field of and positions on the Earth. Estimation of the gravitational field via gravitation gradiometry, the measurement of variations in the direction and magnitude of gravitation with respect to position, is this dissertation's focus. Gravity Probe B (GP-B) is a Stanford satellite experiment in gravitational physics. GP-B will measure the precession the rotating Earth causes on the space time around it by observing the precessions of four gyroscopes in a circular, polar, drag-free orbit at 650 km altitude. The gyroscopes are nearly perfect niobium-coated spheres of quartz, operating at 1.8 K to permit observations with extremely low thermal noise. The permissible gyroscope drift rate is miniscule, so the torques on the gyros must be tiny. A drag-free control system, by canceling accelerations caused by nongravitational forces, minimizes the support forces and hence torques. The GP-B system offers two main possibilities for geodesy. One is as a drag-free satellite to be used in trajectory-based estimates of the Earth's gravity field. We described calculations involving that approach in our previous reports, including comparison of laser only, GPS only, and combined tracking and a preliminary estimate of the possibility of estimating relativistic effects on the orbit. The second possibility is gradiometry. This technique has received a more cursory examination in previous reports, so we concentrate on it here. We explore the feasibility of using the residual suspension forces centering the GP-B gyros as gradiometer signals for geodesy. The objective of this work is a statistical prediction of the formal uncertainty in an estimate of the Earth's gravitation field using data from GP-B. We perform an instrument analysis and apply two mathematical techniques to predict uncertainty. One is an analytical approach using a flat-Earth approximation to predict geopotential information quality as a function of spatial wavelength. The second estimates the covariance matrix arising in a least-squares estimate of a spherical harmonic representation of the geopotential using GP-B gradiometer data. The results show that the GP-B data set can be used to create a consistent estimate of the geopotential up to spherical harmonic degree and order 60. The formal uncertainty of all coefficients between degrees 5 and 50 is reduced by factors of up to 30 over current satellite-only estimates and up to 7 over estimates which include surface data. The primary conclusion resulting from this study is that the gravitation gradiometer geodesy coexperiment to GP-B is both feasible and attractive. Author (revised)

The Remote Vehicle Survey Tool (RVS7) is a color graphical display tool for viewing remotely acquired scientific data. The RVST displays the data in the form of a color two-dimensional world model map. The world model map allows movement of the remote vehicle to be tracked by the operator and the data from sensors to be graphically depicted in the interface. Linear and logarithmic meters, dual channel oscilloscopes, and directional compasses are used to display sensor information. The RVST is user-configurable by the use of ASCII text files. The operator can configure the RVST to work with any remote data acquisition system and teleoperated or autonomous vehicle. The modular design of the RVST and its ability to be quickly configured for varying system requirements make the RVST ideal for remote scientific data display in all environmental restoration and waste management programs. (BCRS-92-06; TD-92-2904; ISBN-90-5411-037-6; ETN-93-93751) Avail: CASI HC A06/MF A02

The Maestro-1 radar campaign which focused on the deployment of AIRSAR, a model, polarimetric multiband imaging radar system, to study the capabilities of multiband polarimetric radar data is addressed. The introduction of P band data, acquired simultaneously with the C and L band data, was recognized as interesting for the development of certain applications, notably on forestry and soil studies. On 16 Aug. 1989 three sites in The Netherlands, an agricultural area, the Hosterwold forest in Southern Flevoland, and the Speulderbos forest at The Veluwe are flown over and an extensive ground dataset was collected. The following are discussed: the polarimetric calibration; the database; the polarimetric features of agricultural fields and forests; the polarimetric contrast classification of agricultural fields and forests; the analysis of Maestro data in bare soil; and the results for forests. ESA

PREPROCESSING AIRBORNE REMOTE SENSING PARES CALIBRATION MAINTENANCE FUNCTIONAL DESIGN DOCUMENT
G. M. H. J. Habets (National Aerospace Lab., Amsterdam, Netherlands.), A. J. Rietveld (National Aerospace Lab., Amsterdam, Netherlands.), and W.

J. Looijen Aug. 1992 . 54 p
(BCRS Proj. TE-2.10)
(BCRS-92-07; NLR-CR-92043-L; TD-92-2906; ISBN-90-5411-040-6; ETN-93-93752) Avail: CASI HC A04/MF A01

The functional design of the calibration maintenance part of the Preprocessing Airborne Remote Sensing (PARES) information system, a general software package for radiometric and geometric correction of image data recorded by airborne remote sensing scanning systems, is described. Images of two scanning systems can be corrected by PARES: Side Looking Airborne Radar (SLAR) images, and Charge Coupled Device (CCD) Airborne Experimental Scanner for Applications in Remote sensing (CAESAR) images. The calibration of SLAR images is contained inside the image data itself. The results of the calibration of the antenna gain of SLAR are included in the PARES software. The CAESAR scanner needs calibration of the A/D converter and of the charge coupled device arrays it uses to be able to correct the image data radiometrically. The calibration maintenance is mainly dedicated to the CAESAR scanner. Since the operating modes of CAESAR are gradually incremented and since existing modes are repeatedly calibrated during the lifecycle of the sensor, new calibrations are unavoidable. As a result, the calibration maintenance comprises functions to add, test, validate, analyze, and visualize calibrations in order to assure that the radiometric specifications of the scanner are being fulfilled. NATIONAL REMOTE SENSING PROGRAMME 2 ACMS PROJECT. PHASE 1: VALIDATION. PART 1: DEFINITION OF VALIDATION EXPERIMENT
Jul. 1992 17 p Prepared in cooperation with Environmental Analysis and Remote Sensing, Delft, Netherlands
(BCRS Proj. 3.2/CO-01)
(BCRS-92-10-Phase-1-Pt-1; TD-92-9548-Phase-1-Pt-1; ISBN-90-5411-048-1; ETN-93-93753) Avail: CASI HC A03/MF A01

On the basis of the study entitled 'Product development plan in agrometeorology and crop forecasting' an Agromet Crop Monitoring System (ACMS) was proposed. This consists of a PC based Meteosat PDFUS, a PC based processing system (to produce rainfall, actual evapotranspiration, relative growth and thermal inertial maps from Meteosat imagery); and a PC based GIS which will allow the user to integrate the Meteosat products, as well as externally aquired satellite products, particularly NOAA, in a GIS environment, dedicated to his own needs. For this purpose a modified ILWIS system was suggested, which could be adapted to two kinds of applications: agrometeorology and crop monitoring, and hydrology. The set up of an experiment to validate the monitoring techniques in question particularly those concerning the mapping of actuall evapotranspiration and crop growth, is discussed. The possibility of comparison with the NOAA-NDVI (Normalized Difference Vegetation Index) approach is also considered. A validation experiment is finally proposed. ESA

(BCRS Proj. 6.5/IS-08)
(BCRS-92-12; ISBN-90-5411-050-3; TD-92-2907; ETN-93-93754) Avail: CASI HC A10/MF A03

Possibilities of cooperation, with regard to remote sensing (RS), of the Netherlands with Czechoslovakia and Hungary are addressed. In both countries information was collected through interviews with people involved in this field. The report can be regarded as a cookbook for cooperation of the Netherlands with Hungary and Czechoslovakia, to be used by Dutch agencies (consultancy firms, institutes etc.) working in this field and seeking cooperation with RS agencies in the two East European countries. Its recipes state: who is who in Czechoslovakia and in Hungary in remote sensing; what are their specific interests and specialities; who is active in RS research, application or training; what kind of equipment is available; which goods and services are either offered or needed; how is the RS organization and cooperation in the two countries; and who are the main finding agencies. MULTIPLE IMAGE MULTIPOINT MATCHING FOR AUTOMATIC AEROTRIANGULATION Ph.D. Thesis
Panayota Agouris 1992 133 p
Avail: Univ. Microfilms Order No. DA9307712

Performing an automatic aerotriangulation using digital image processing methods and images available exclusively in digital format is addressed. A conceptual system was developed and implemented which allows the determination of exterior orientation parameters and positions of selected points in object space using a minimal number of assumptions. In direct analogy to the preparation phase of the conventional approach, a photomosaic was automatically generated to describe the interrelationship of all photos within the available block. It was created using matched pairs of conjugate points in all stereo pairs formed within the block and it provides the necessary transition from stereo to n-stage operations. This photomosaic was subsequently used for the automatic extraction of approximate conjugate image coordinates. By examining its accuracy at various levels of resolution, the finer resolution for which the photomosaic produces sufficiently accurate conjugate points is selected as the first level at which precise least squares matching is executed. Thus, the system becomes more economical by having multiphoto matching performed at the minimum necessary number of levels of resolution. A multiple image multipoint matching strategy was developed to identify and precisely match conjugate points in the triple, quadruple or multiple overlapping areas of the block. By taking into account the geometric relationship between conjugate points as it is expressed by their corresponding image forming rays, and using image coordinates rather than the widely used local template coordinates, matching and block adjustment can be combined in a unique way. Thus, the mensuration and adjustment phases of classical aerotriangulation are substituted by a single digital process. Even though, strictly speaking, matching is not carried out in the object space, it is actually performed through the object space. The obtained solution is forced not only to be radiometrically coherent like all typical least squares matching techniques, but to be geometrically coherent as well. The accuracy of the results is improved by repeating the process through finer levels of image pyramids and thus reducing the pixel size. Experimental results confirmed the derived theoretical strategy and support its quality and feasibility. The introduction of digital techniques offers a solution to the problem of subjective point identification errors associated with a human operator who is unable to observe more than two photos at a time. Instead, multiphoto matching is essentially a digitally implemented n-stage comparator. Having this as its core module, the presented digital aerotriangulation scheme, apart from flexible and efficient, is also really close to becoming fully automatic. Dissert. Abstr.

CHARTING THE REMOTE SOUTHERN OCEANS WITH GEOSAT ALTIMETRY Final Technical Report
David T. Sandwell, Walter Smith, Jacqueline Mammerickx, and Robert Parker 13 Apr. 1993 11 p
(Contract N00014-91-J-1642)
(AD-A263452) Avail: CASI HC A03/MF A01

The Geosat satellite altimeter has mapped the marine gravity field over nearly all of the world's oceans to a high accuracy and high spatial resolution. In the wavelength band 15 to 200 km, variations in gravity anomaly are highly correlated with seafloor topography. Since many southern ocean areas are sparsely surveyed, these new Geosat data reveal many previously unsurveyed features such as seamounts and fracture zones. The objectives of our proposed research were as follows: (1) Develop a method of combining geoid heights (or gravity anomalies) with shipboard profiles in order to improve bathymetric charts. (2) Evaluate the method by comparing bathymetric predictions with measured seafloor depths in two areas south of 60 deg S. (3) Produce an improved unclassified version of the Navy's standard bathymetric data base of the southern ocean (i.e. between 60 deg S and 72 deg S). (4) Produce an improved classified version of the Navy's standard bathymetric data base of the Southern Hemisphere (i.e. south of the equator). The original cost of the proposed research to be conducted over a 3 year period was $485,237. Due to a budget cut at DMA our budget was reduced to $40,000. Thus we completed only a small fraction of the proposed research as outlined in the attached progress reports. DTIC

MODELING THE BIDIRECTIONAL REFLECTANCE AND SPECTRA

Crystal B. Schaaf and Alan H. Strahler 20 Apr. 1993 9 p
(AD-A263570; PL-TR-93-2096) Avail: CASI HC A02/MF A01

Analysis of aircraft imagery and ground measurements acquired for a spruce forest stand in Howland, Maine as part of the 1990 Forest Ecosystem Dynamics Multisensor Aircraft Campaign (FEDMAC), show that the Li-Strahler geometric-optical forest canopy reflectance model can estimate spectral bidirectional reflectance factors and spectral albedo with some success. In this model, the vegetated surface is treated as an assemblage of partially illuminated tree crowns of ellipsoidal shape, and through geometric-optics and Boolean set theory, the proportion of sunlit and shadowed canopy and background is modeled as a function of view angle. Tne model is driven by ground measurements of spectral reflectance and tree crown shape, size, and spacing. Atmospherically corrected multiangular radiance measurements from the Advanced Solid State Array Spectroradiometer (ASAS) fit the shape of the modeled reflectance function quite well. Integration of the reflectance function yields a spectral albedo, which, when extended to the full solar spectrum, agrees with pyranometer measurements obtained at the site. DTIC

THE ESTIMATION AND SCALING OF LAND-SURFACE FLUXES OF LATENT AND SENSIBLE HEAT WITH REMOTELY SENSED DATA OVER A GRASSLAND SITE Ph.D. Thesis

Karen Sue Humes 1992 259 p
Avail: Univ. Microfilms Order No. DA9309021

The overall topic of the research described was the partitioning of available energy at the Earth's surface into sensible and latent heat flux, with an emphasis on the development of techniques which utilize remotely sensed data. One of the major objectives was to investigate the modification of existing techniques, developed over agricultural surfaces, to 'natural' ecosystems (i.e., non-agricultural vegetation types with variable and incomplete canopy cover). Ground-based measurements of surface fluxes, vegetation cover, and surface and root-zone soil moisture from the First ISLSCP (International Land Surface Climatology Program) Field Experiment (FIFE) were used to examine the factors controlling the partitioning of energy at ground stations with contrasting surface characteristics. Utilizing helicopter-based and satellite-based data acquired directly over ground-based flux stations at the FIFE experimental area, relatively simple algorithms were developed for estimating the soil heat flux and sensible heat flux from remotely sensed data. The root mean square error (RMSE) between the sensible heat flux computed with the remotely sensed data and the sensible heat flux measured at the ground stations was 33 Wm(sup 2). These algorithms were then applied on a pixel-by-pixel basis to data from a Landsat-TM (Thematic Mapper) scene acquired over the FIFE site on 15 Aug. 1987 to produce spatially distributed surface energy-balance components for the FIFE site. A methodology for quantifying the effect of spatial scaling on parameters derived from remotely sensed data was presented. As an example of the utility of this approach, NDVI values for the FIFE experimental area were computed with input data of variable spatial resolution. The differences in the values of NDVI computed at different spatial resolutions were accurately predicted by an equation which quantified those differences in terms of variability in input observations. Dissert. Abstr.

THE POSSIBLE DIRECT USE OF SATELLITE RADIANCE MEASUREMENTS BY THE ATMOSPHERIC RADIATION MEASUREMENT PROGRAM

Mar. 1993 76 p
(DE93-009819; DOE/ER-0585T) Avail: CASI HC A05/MF A01

The Atmospheric Radiation Measurement (ARM) Program is a major research program initiated by the Department of Energy to improve our understanding of radiative and cloud processes critical to predicting the Earth's climate and its changes. Central to this concept is the use of four to six intensively instrumented sites for long-term study and characterization of the processes of interest. The instrumentation suites will include ground-based, high-accuracy radiometers for measuring the short and longwave surface flux, as well as an extensive set of ground-and air-based instrumentation for characterizing the intervening atmospheric column. Satellite-based measurements are expected to play a very important role in providing top-of-the-atmosphere measurements. The possibility of comparing ARM outputs directly with satellite measurements, thereby ensuring the independence of these two important data sets, is examined. Thus focus was on what do satellites really measure and how well do they measure it; on what can we do about the general lack of adequate visible channel calibration; on what is the best way for ARM to obtain near-real-time access to this unprocessed data; and on what is the optimum way for ARM to make use of satellite data. ANALYSIS OF THERMAL BAR USING BOUNDARY-LAYER INTEGRAL EQUATIONS GRADIENTS

Anthony Kay Sep. 1992 13 p
(MATHS-Rept-A-177; ETN-93-93741) Avail: CASI HC A03/MF A01

The possibility of modeling lakes by examination of the thermal bar in isolation is discussed. Taking advantage of an analogy with a heated vertical plate immersed in fluid, an analysis of the thermal bar (which occurs at the isotherm of the temperature of maximum density in water) by means of boundary layer integral equations, is presented. Similar scalings to those for the heated plate are found, but the effects of viscosity appear to be only of secondary importance. ESA

REMOTE SENSING FOR WATER QUALITY MONITORING IN THE TENNESSEE VALLEY: FIELD TESTS OF TWO SYSTEMS

F. Dierberg 25 Aug. 1992 123 p
(DE93-008997; TVA/WR-92/17) Avail: CASI HC A06/MF A02

Two airborne remote sensing systems, the Compact Airborne Spectrographic Imager (CASI), and the Airborne Multispectral Measurement System (AMMS) were field tested over reservoirs in the Tennessee River valley during the summer of 1991 and winter (AMMS only) of 1992. Univariate, linear regression analyses using single or ratioed wavelength bands and line height algorithms for spectral energy in the 625-725 nm wavelength range provided the best correlations to ground-truthed uncorrected chlorophyll A, turbidity, suspended solids, and Secchi disk transparency. Details of these monitoring studies are included. DOE

A land use data base for the Netherlands was drawn up using satellite images. This data base can be used on national scale with a view to water management, protection of soil and ground water, and country planning. The data base consists of a raster with pixels of 25 by 25 m covering the whole country. Fifteen land use classes can be distinguished with emphasis on agricultural land use. The applicability on a regional scale depends on land use, vegetation growth, and satellite image recording. ESA

The CAESAR (CCD (Charge Coupled Device) Airborne Experimental Scanner for Applications in Remote sensing) development plan is presented. CAESAR is a multispectral pushroom scanner using linear charge coupled device detector arrays. An overview of the existing CAESAR system is presented in order to understand the proposed modifications. A list of the proposed modifications is given. These modifications concern the sensors, filters, mounting, data handling, electronics, calibration and operational aspects. The feasibility of the proposed modifications is elaborated on and conclusions are given. A product description of a stabilization platform is included in the appendix. ESA

ERS-1 DIRECTIONAL WAVE SPECTRA VALIDATION WITH THE AIRBORNE SAR PHARS
J. C. M. Kleijweg (Physics and Electronics Lab. TNO, The Hague, Netherlands.) and H. Greidanus (Physics and Electronics Lab. TNO, The Hague, Netherlands.) Oct. 1992 57 p
(BCRS-92-18; FEL-92-C282; ISBN-9-05-411061-9; ETN-93-94090) Avail: CASI HC A04/MF A01

The ERS-1 calibration/validation campaign 'RENE91' is reported. The purpose was to validate ERS-1 geophysical products using other remotely sensed data and in situ measurements. For three days during this campaign, the airborne 'PHARS' (Phased Array SAR (Synthetic Aperture Radar)) measured ocean wave spectra concurrent with the ERS-1 and with a surface radar system and a wave buoy. The results of these instruments are compared, and subsequently interpreted on the basis of SAR ocean wave imaging theory. A total of seven ERS-1 and 14 PHARS wave spectra are analyzed, together with numerous surface radar and buoy spectra. All these spectra contained a total of 13 different wave systems. From the intercomparison, it was found that: very short waves (less than 70 m wavelength) are not seen by ERS-1, nor by PHARS; roughly half the wave occurrences are detected by both ERS-1 and PHARS, the remaining are missed by either or both; peak wavelength and direction of the same wave component can differ considerably as imaged by the various sensors; ERS-1 misses more wave systems than PHARS, especially azimuth traveling ones. All these effects can be understood in terms of the elements of the SAR ocean wave imaging process: scanning distortion, velocity bunching, and defocusing. ESA

BAYESIAN LINEAR ANALYSIS WITH APPLICATION TO REMOVAL OF ATMOSPHERIC INFLUENCES ON OPTICAL REMOTE SENSING IMAGES
V. L. Dolman (Vrije Univ., Amsterdam, Netherlands.), J. F. deHaan (Vrije Univ., Amsterdam, Netherlands.), and J. W. Hovenier (Vrije Univ., Amsterdam, Netherlands.) Oct. 1992 137 p
(BCRS-92-19; ISBN-9-05-411060-0; ETN-93-94091) Avail: CASI HC A07/MF A02

Research aimed at the development of methods for removal of atmospheric influences on visual and near infrared remote sensing imagery is presented. Remote sensing of the Earth involves an exceedingly complex system. Structural progress in quantitative analysis of the system requires combination of data from different sources. A major problem is reliable estimation of errors due to measurement errors and to uncertainty about the system's properties that are not measured. It is shown that Bayesian analysis provides a general strategy to incorporate data from different sources in the estimation of any quantity of interest and its error. In the analysis, the role of physical models is crucial. The maximum entropy principle is applied to ensure that the analysis is based only upon information that is actually available. A dramatic simplification results if several relations between quantities are linearized. This leads to a very simple algorithm to analyze remote sensing and related data which requires only a tiny computational effort. This algorithm and the underlying formalism is presented. It is also shown that Bayesian linear analysis allows various types of analytical insight. The analysis is applied to the problem of removal of atmospheric influences on optical satellite imagery. Here, linearization errors turn out to be rather small. Various aspects of the atmospheric correction problem are investigated, analytically as well as numerically. It is concluded that Bayesian linear analysis is a useful approach for the analysis of remote sensing and related data. ESA

THE NATURAL EXCITATION TECHNIQUE (NExT) FOR MODAL PARAMETER EXTRACTION FROM OPERATING WIND TURBINES
George H. James, III, Thomas G. Carne, and James P. Lauffer Feb. 1993 46 p
(Contract DE-AC04-76DP-00789)
(DE93-010611; SAND-92-1666) Avail: CASI HC A03/MF A01

The Natural Excitation Technique (NExT) is a method of modal testing that allows structures to be tested in their ambient environments. This report is a compilation of developments and results since 1990, and contains a new theoretical derivation of NExT, as well as a verification using analytically generated data. In addition, we compare results from NExT with conventional modal testing for a parked, vertical-axis wind turbine, and, for a rotating turbine, NExT is used to calculate the model parameters as functions of the rotation speed, since substantial damping is derived from the aeroelastic interactions during operation. Finally, we compare experimental results calculated using NExT with analytical predictions of damping using aeroelastic theory. DOE

NEW III-V CELL DESIGN APPROACHES FOR VERY HIGH EFFICIENCY

M. S. Lundstrom, M. R. Melloch, G. B. Lush, M. P. Patkar, and M. P. Young Apr. 1993 110 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-000097; NREL/TP-451-5355) Avail: CASI HC A06/MF A02

This report describes to examine new solar cell design approaches for achieving very high conversion efficiencies. The program consists of two elements. The first centers on exploring new thin-film approaches specifically designed for M-3 semiconductors. Substantial efficiency gains may be possible by employing light trapping techniques to confine the incident photons, as well as the photons emitted by radiative recombination. The thin-film approach is a promising route for achieving substantial performance improvements in the already high-efficiency, single-junction, 3-5 cell. The second element of the research involves exploring design approaches for achieving high conversion efficiencies without requiring extremely high-quality material. This work has applications to multiple-junction cells, for which the selection of a component cell often involves a compromise between optimum band pp and optimum material quality. It could also be a benefitial manufacturing environment by making the cell's efficiency less dependent on material quality. DOE

ALKALI METAL CARBON DIOXIDE ELECTROCHEMICAL SYSTEM FOR ENERGY STORAGE AND/OR CONVERSION OF CARBON DIOXIDE TO OXYGEN Patent

Norman H. Hagedorn, inventor (to NASA) 25 May 1993 7 p Filed 26 Sep. 1991 Supersedes N92-10222 (30 - 1, p 42)
(NASA-Case-LEW-14973-1; US-Patent-5,213,908;
US-Patent-Appl-SN-766593; US-Patent-Class-429-16;
US-Patent-Class-429-27; US-Patent-Class-429-29; US-Patent-Class-429-30;
US-Patent-Class-429-46; US-Patent-Class-429-103;
Int-Patent-Class-H01M-8/14) Avail: US Patent and Trademark Office

An alkali metal, such as lithium, is the anodic reactant; carbon dioxide or a mixture of carbon dioxide and carbon monoxide is the cathodic reactant; and carbonate of the alkali metal is the electrolyte in an electrochemical cell for the storage and delivery of electrical energy. Additionally, alkali metal-carbon dioxide battery systems include a plurality of such electrochemical cells. Gold is a preferred catalyst for reducing the carbon dioxide at the cathode. The fuel cell of the invention produces electrochemical energy through the use of an anodic reactant which is extremely energetic and light, and a cathodic reactant which can be extracted from its environment and therefore exacts no transportation penalty. The invention is, therefore, especially useful in extraterrestrial environments.

POLYMER ELECTROLYTE FUEL CELLS FOR TRANSPORTATION APPLICATIONS

T. E. Springer, M. S. Wilson, F. H. Garzon, T. A. Zawodzinski, and S. Gottesfeld 1993 13 p Presented at the Electric Vehicle Symposium, Honolulu, HI, 16-23 May 1993
(Contract W-7405-eng-36)
(DE93-008721; LA-UR-93-728; CONF-9305150-1) Avail: CASI HC A03/MF A01

The application of the polymer electrolyte fuel cell (PEFC) as a primary power source in electric vehicles has received increasing attention during the last few years. This increased attention has been fueled by a combination of significant technical advances in this field and by the initiation of some projects for the demonstration of a complete, PEFC-based power system in a bus or in a passenger car. Such demonstration projects reflect an increased faith of industry in the potential of this technology for transportation applications, or, at least, in the need for a detailed evaluation of this potential. Nevertheless, large scale transportation applications of PEFC's require a continued concerted effort of research on catalysis, materials and components, combined with the engineering efforts addressing the complete power system. This is required to achieve cost effective, highly performing PEFC stack and power system. We describe in this contribution some recent results of work performed within the Core Research PEFC Program at Los Alamos National Laboratory, which has addressed transportation applications of PEFC's. SOLID OXIDE FUEL CELLS FOR TRANSPORTATION: A CLEAN, EFFICIENT ALTERNATIVE FOR PROPULSION

R. Kumar, M. Krumpelt, and K. M. Myles 1993 9 p Presented at the 183rd Electrochemical Society Meeting, Honolulu, HI, 16-21 May 1993
(Contract W-31-109-eng-38)
(DE93-010662; ANL/CMT/CP-77865; CONF-930571-8) Avail: CASI HC A02/MF A01

Fuel cells show great promise for providing clean and efficient transportation power. Of the fuel cell propulsion systems under investigation, the solid oxide fuel cell (SOFC) is particularly attractive for heavy duty transportation applications that have a relatively long duty cycle, such as locomotives, trucks, and barges. Advantages of the SOFC include a simple, compact system configuration; inherent fuel flexibility for hydrocarbon and alternative fuels; and minimal water management. The specific advantages of the SOFC for powering a railroad locomotive are examined. Feasibility, practicality, and safety concerns regarding SOFCs in transportation applications are discussed. DOE

MODIFICATION OF FLUX PROFILES USING A FACETED CONCENTRATOR

A. Lewandowski, K. Scholl, and C. Bingham Jan. 1993 7 p Presented at the SOLAR 1993: American Society of Mechanical Engineers (ASME)/American Solar Energy Society (ASES) Joint Solar Energy Conference, Washington, DC, 22-28 Apr. 1993
(Contract DE-AC02-83CH-10093)
(DE93-000087; NREL/TP-471-5352; CONF-930435-7) Avail: CASI HC A02/MF A01

The use of a faceted solar concentrator allows for some flexibility in aiming strategy and in the intensity of the resulting flux profile at the target. This can be an advantage when considering applications that do not necessarily require maximum concentration, particularly emerging, new applications in solar processed advanced materials. This paper will describe both an analysis of predicted flux profiles for several different aiming strategies using the SOLFUR computer code and experiments to characterize the actual flux profiles realized with a selected aiming strategy. The SOLFUR code models each of the furnace components explicitly. Aim points for each facet can be specified. Thus, many strategies for adjusting aim points can be easily explored. One strategy calls for creating as uniform a flux over as large an area as possible. We explored this strategy analytically and experimentally. The experimental data consist of flux maps generated by a video imaging system calibrated against absolute flux measurements taken with circular foil calorimeters. Results from the analytical study and a comparison with the experimental data indicate that uniform profiles can be produced over fairly large areas. DOE

LOW-COST, HIGH-EFFICIENCY SOLAR CELLS UTILIZING GaAs-ON-Si TECHNOLOGY

S. M. Vernon Apr. 1993 25 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-000096; NREL/TP-451-5353) Avail: CASI HC A03/MF A01

This report describes work to develop technology to deposit GaAs on Si using a nucleation layer of atomic-layer-epitaxy-grown GaAs or AlAs on Si. This ensures two-dimensional nucleation and should lead to fewer defects in the final GaAs layer. As an alternative, we also developed technology for depositing GaAs on sawtooth-patterned Si. Preliminary studies showed that this material can have a very low defect density, approximately 1 x 10(exp 5) cm(exp -5), as opposed to our conventionally grown GaAs on SL which has a typical defect density of over 1 x 10(exp 7) cm(exp -2). Using these two new methods of GaAs-on-Si material growth, we made solar cells that are expected to show higher efficiencies than those of previous cells. DOE

DIRECT USE GEOTHERMAL APPLICATIONS FOR BRAZED PLATE HEAT EXCHANGERS
K. Rafferty Feb. 1993 66 p
(Contract DE-FG07-90ID-13040)
(DE93-008559; DOE/ID-13040/18) Avail: CASI HC A04/MF A01

Brazed plate heat exchanger were placed in three geothermal fluids (Klamath Falls, OR; Boise, ID; and Pagosa Springs, CO) in order to determine the effect of H2S on braze material. Based on subsequent analysis, it appears that the rate of corrosion of the braze material is much slower than corrosion of copper tube materials in the same fluids. Minimum expected life of the heat exchangers based on these corrosion rates is reported to be 12 years in fluids of less than 1 ppm H2S and 10 years in fluids of less than 5 ppm. Based on these expected lives, and using a 3% inflation rate and 8% discount rate, brazed plate heat exchangers are a clear economic choice in which the capital cost is 50% or less of the cost of a plate and frame heat exchanger for the same duty. Due to their single pass design, brazed plate heat exchangers are generally limited to approach temperatures of 10 deg or greater. Size limitations restrict applications to 100 gpm and/or 200 sq ft heat transfer surface area. DOE

PREFEASIBILITY STUDY ON COMPRESSED AIR ENERGY STORAGE SYSTEMS [PAINEILMAVARASTON KAYTTO SAHKON TUOTANNOSSA]
Yehia ElMahgary, Esa Peltola, Kari Sipila, and Anne Vaatainen Aug. 1991 66 p
(VTT-TIED-1267; ISBN-9-51-383899-4; ETN-93-93774) Copyright Avail: CASI HC A04/MF A01

A prefeasibility study on Compressed Air Energy Storage (CAES) systems is presented. The costs of excavating rock caverns for compressed air storage and those for forming suitable storage caverns in existing mines were estimated, and this information was used to calculate the economics of CAES. An analysis of the different possible systems is given following a review of literature on CAES. This was followed by an economic analysis which comprised two separate systems. The first consisted of conventional oil fueled gas turbine plants provided with CAES system. In the second system wind turbines were used to run the compressors which are used in charging the compressed air storage cavern. The results of the current prefeasibility study confirmed the economic attractiveness of the CAES in the first system. Wind turbines still seem, however, to be too expensive to compete with coal power plants. More accurate and straightforward results could be obtained only in a more comprehensive study. ESA

STUDY OF PARAMETERS AFFECTING THE PERFORMANCE OF SOLAR DESICCANT COOLING SYSTEMS
A. A. Pesaran and E. A. Hoo Jan. 1993 7 p Presented at the SOLAR 1993: American Society of Mechanical Engineers (ASME)/American Solar Energy Society (ASES) Joint Solar Energy Conference, Washington, DC, 22-28 Apr. 1993
(Contract DE-AC02-83CH-10093)
(DE93-000088; NREL/TP-471-5375; CONF-930435-6) Avail: CASI HC A02/MF A01

The performance of a solar desiccant cooling system depends on the performance of its components, particularly the desiccant dehumidifier and solar collectors. The desiccant dehumidifier performance is affected by the properties of the desiccant, particularly the shape of the isotherm and the regeneration temperature. The performance of a solar collector, as one would expect, depends on its operating temperature, which is very close to the desiccant regeneration temperature. The purpose of this study was to identify the desiccant isotherm shape (characterized by separation factor) that would result in the optimum performance - based on thermal coefficient of performance and cooling capacity - of a desiccant cooling cycle operating in ventilation mode. Different regeneration temperatures ranging from 65 to 160 C were investigated to identify the corresponding optimum isotherm shape at each. Thermal COP dictates the required area of the solar collectors, and the cooling capacity is an indication of the size and cost of the cooling equipment. Staged and no-staged regeneration methods were studied. DOE

MEASUREMENTS AND CHARACTERIZATION BRANCH Annual Report, FY 1992
P. Dippo, ed. Mar. 1993 27 p
(Contract DE-AC02-83CH-10093)
(DE93-000094; NREL/TP-412-5422) Avail: CASI HC A03/MF A01

The Measurements and Characterization Branch actively supports the advancement of DOE/NREL goals for the development and implementation of the solar photovoltaic (PV) technology. The primary focus of the laboratories is to provide state-of-the-art analytical capabilities for materials and device characterization and fabrication. The branch houses a comprehensive facility that is capable of providing information on the full range of PV components. A major objective of the branch is to aggressively pursue collaborative research with other government laboratories, universities, and industrial firms for the advancement of Pv technologies. Members of the branch disseminate research findings to the technical community in publications and presentations. The Measurements and Characterization Branch encompasses seven coordinated research groups, providing integrated research and development that covers all aspects of photovoltaic materials/devices characterization. GROWTH AND DEVELOPMENT OF GaInAsP FOR USE IN HIGH-EFFICIENCY SOLAR CELLS
P. R. Sharps Apr. 1993 18 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE93-000098; NREL/TP-451-5414) Avail: CASI HC A03/MF A01

This report describes work done during Phase 2 of the subcontract. Goals for Phase 2 include the following: (1) Optimize the GaInAsP cell on GaAs and demonstrate a 500-sun at air mass (AM) 1.5 efficiency of greater than 23%; (2) Develop a window layer, including the evaluation of AlGaAs, GaInP, AlGaAsP, AlGaInP, and GaP; (3) Develop a front-surface contact, with a grid designed for 500-sun concentration, and a goal of a contact resistivity of approximately 10(exp 5) ohm-cm(exp 2); (4) Grow GaInAsP cells on Ge, with a goal of a 1-sun (AM 1.5) efficiency of greater than 15%. Accomplishments reported herein include (1) the fabrication of p-on-n and n-on-p GaInAsP cells on GaAs, with the n-on-p cell demonstrating a 10-sun (AM 1.5) active-area efficiency of 23.4% as measured at NREL, (2) the evaluation of Al(x)Ga(1-x)As, GaInP2, and AlInP2 window layers; and (3) the fabrication of GaInAsP cells on Ge, with the demonstration of a p-on-n GaInAsP cell grown on Ge with a 1-sun (AM 1.5) active-area efficiency of 14.4%. THERMAL EFFECTS TESTING AT THE NATIONAL SOLAR THERMAL TEST FACILITY
M. E. Ralph, C. P. Cameron, and C. M. Ghanbari 1992 13 p Presented

at the 39th International Instrumentation Symposium, Albuquerque, NM, 2-6 May 1993
(Contract DE-AC04-76DP-00789)
(DE93-009825; SAND-92-2167C; CONF-930561-3) Avail: CASI HC A03/MF A01

The National Solar Thermal Test Facility is operated by Sandia National Laboratories and located on Kirkland Air Force Base in Albuquerque, New Mexico. The permanent features of the facility include a heliostat field and associated receiver tower, two solar furnaces, two point-focus parabolic concentrators, and Engine Test Facility. The heliostat field contains 220 computer-controlled mirrors, which reflect concentrated solar energy to test stations on a 61-m tower. The field produces a peak flux density of 250 W/cm(sup 2) that is uniform over a 15-cm diameter with a total beam power of over 5 MW(sub t). The solar beam has been used to simulate aerodynamic heating for several customers. Thermal nuclear blasts have also been simulated using a high-speed shutter in combination with heliostat control. The shutter can accommodate samples up to 1 m (times) 1 m and it has been used by several US and Canadian agencies. A glass-windowed wind tunnel is also available in the Solar Tower. It provides simultaneous exposure to the thermal flux and air flow. Each solar furnace at the facility includes a heliostat, an attenuator, and a parabolic concentrator. One solar furnace produces flux levels of 270 W/cm(sup 2) over and delivers a 6-mm diameter and total power of 16 kW(sub t). A second furnace produces flux levels up to 1000 W/cm(sup 2) over a 4 cm diameter and total power of 60 kW(sub t). Both furnaces include shutters and attenuators that can provide square or shaped pulses. The two 11 m diameter tracking parabolic point-focusing concentrators at the facility can each produce peak flux levels of 1500 W/cm(sup 2) over a 2.5 cm diameter and total power of 75 kW(sub t). High-speed shutters have been used to produce square pulses. DOE

Examinations of each component behavior of a solar generator system are carried out. A solar tank station was supplied to an electric car on a low loss regulator. By using a large system battery, the vehicle battery could be fully loaded. Several loading processes were used for the electric car by using the system battery with an intelligent regulator. Examinations for range optimization were achieved with integration of a measure data acquisition system in the electric car. A measuring process was developed for recording the current-voltage curve of high power solar generators with low-loss load simulators. A state analysis of solar generator was obtained by comparison of data sets. A software tool was realized for analysis of operation state. By converting equivalent schemes into simulation programs, device optimization was carried out with parameter variation. ESA

A series of experimental studies on the influence of alkali and alkaline-earth metal films on electro-physical properties of solar elements used for spacecraft energy supply was carried out. Metal films of different thicknesses were deposited using an effusion source, the mass of the film was calculated using measured atomic beam density. The Mg film thickness was determined by means of microscopic technique. The dynamics of current-to-voltage characteristic variation was studied for different film thickness and chemical composition in vacuum and in oxygen atmosphere. DOE

A gas-fired heat pump using complex compound chemisorption media and ammonia refrigerant is being developed. Complex compounds are advantageous because they adsorb large amounts of refrigerant (up to 80 percent of the adsorbent dry weight), exhibit vapor pressure independent of refrigerant concentration, can be made to adsorb very rapidly, and can be formulated to have different vapor pressures. The heat pump being developed has three stages, each using a different formulation. Multiple stages are used to increase efficiency, giving cooling COPs near one. Heating-mode operation at ambient temperatures of -20 F and below can also be achieved. The report presents results from Phase 1 of the development project. Phase 1 efforts focused on generation of engineering data to ensure that no major obstacles would be met in future development, and to provide data necessary for design of a breadboard system. Work included the following: (1) optimization of the sorbers internal heat and mass transfer hardware to maximize sorption rates and minimize cost, (2) qualification of sorbent media with respect to stability and corrosion, (3) estimation of manufacturing and operating costs, and (4) development of preliminary designs for heat pump and AC systems. (DE93-010008; NREL/TP-411-5455) Avail: CASI HC A03/MF A01

This report describes work on a project to develop an advanced low-cost manufacturing process for a new utility-scale flatplate module based on thin active layers of polycrystalline silicon on a low-cost substrate. This is called the Silicon-Film(trademark) process. This new power module is based on a new large solar cell that is 675 sq cm in area. Eighteen of these solar cells form a 170-W module. Twelve of these modules form a 2-kW array. The program has three components: (1) development of a Silicon-Film(trademark) wafer machine that can manufacture wafer 675 sq cm in size with a total product cost reduction of 70%; (2) development of an advanced solar cell manufacturing process that will turn the Silicon-Film(trademark) wafer into a 14%-efficient solar cell; and (3) development of an advanced module design based on these large-area, efficient silicon solar cells with an average power of 170 watts. The completion of these three tasks will lead to a new power module designed for utility and other power applications with a substantially lower cost. DOE

HIGH PERFORMANCE DISPERSION MODEL PHYSIC
Hiromi Yamazawa (Japan Atomic Energy Research Inst., Ibaraki.) Jul. 1992 59 p
(DE93-753303; JAERI-M-92-102) Avail: CASI HC A04/MF A01

The description and usage of the dispersion calculation model PHYSIC were summarized. The model was developed in the study of developing high performance SPEEDI with the purpose of introducing meteorological forecast function into the environmental emergency response system. PHYSIC consists of two parts, the three-dimensional meteorological model and the dispersion model. The former comprises primitive equations with Boussinesq approximation, which are solved by a finite difference method. The latter employs a particle dispersion method. PHYSIC can be used to evaluate the meteorological condition as well as the dispersion from a point source located in a complex terrain. The spatial and temporal scales of the model are 10 to 1000 km horizontally, 1 to 10 km vertically and 1 hour to 1 day, respectively. DOE

RESULTS FROM THE US/RUSSIAN METEOR-3/TOTAL OZONE MAPPING SPECTROMETER Interim Report, 15 Aug. 1991 - 1 Jun. 1992
Jay R. Herman, ed. Jan. 1993 114 p Original contains color illustrations
(NASA-TM-104576; Rept-93B00029; NAS 1.15:104576) Avail: CASI HC A06/MF A02; 9 functional color pages

The development of Meteor-3/TOMS (Total Ozone Mapping Spectrometer) was a joint project of the United States and Russia to fly a U.S. ozone measuring instrument (TOMS) onboard a Russian spacecraft (Meteor-3) and rocket (Cyclone), launched from Plesetsk, Russia. The Meteor-3/TOMS (M3TOMS) was launched into a 1202-km-high, near-polar orbit on 15 Aug. 1991, where it can obtain complete global coverage for most of each year. Both the U.S. and Russian sides have successfully received and processed data into ozone amounts from 25 Aug. 1991 to 1 Jun. 1992, and expect to continue for the life of the instrument and spacecraft. The successful development of the instrument hardware, spacecraft interface, data memory, telemetry systems, and software are described. Descriptions are given of the U.S. and Russian ground stations for receiving M3TOMS data. In addition, the data reduction software was independently developed by the U.S. and by the Russians, and is shown to agree to better than the precision of the measurements. Author (revised)
